- This group covers:
(1) Networking arrangements or communication protocols to support

networked applications which occur at the abstract network layers 5 to 7 of the OSI layer model. The higher layers constitute the interface between the network and the computer applications that use the network to communicate.

(2) Network-specific aspects of client-server applications as well as of networking arrangements supporting networked/distributed applications, e.g. data transport, scheduling. This group also covers specific networked application layer protocols, e.g. FTP, WAP, HTTP.

This group does not cover:

(1) Distributed applications which are network-agnostic, i.e. distributed information systems for which the network functions are transparent. These field are covered, e.g. by [G06F9/00](#), [G06F17/00](#). Data switching network provisions in general and the lower layer network functionalities which support application layer provisions are covered by [H04L12/00](#)] [N1204]
