Foreword to the ninth edition

Over the past 40 years, the Boards of Appeal have developed a substantial body of case law: during this time, we have dealt with more than 46 000 cases and issued over 35 000 decisions. In the same period, the Enlarged Board of Appeal has handed down more than 100 decisions and opinions under Article 112 EPC, in order to clarify legal points of fundamental importance and ensure a uniform application of the law.

The present ninth edition of the "Case Law of the Boards of Appeal of the European Patent Office" provides a comprehensive overview of this case law. It contains summaries of or references to almost 7 000 decisions which were issued in writing in the period up to the end of 2018. Also included are a number of important decisions rendered at the beginning of 2019, as well as the questions of law referred to the Enlarged Board of Appeal under Article 112 EPC in cases **G 1/19**, **G 2/19** and **G 3/19**.

As in previous editions, the decisions are ordered according to topic, although some chapters have been re-arranged to reflect developments in the case law or to allow relevant decisions or topics to be located more easily. Readers should also note that, between editions of the book, regular updates of the Boards' case law are provided by the "EPO Boards of Appeal Case Law" supplementary publications of the EPO Official Journal.

This book will be a useful reference work for anyone interested in European patent law. However, since a summary, no matter how carefully prepared, cannot serve as a substitute for the decision itself, readers should be aware that the texts of all decisions can be found in the decisions database of the Boards of Appeal website (www.epo.org/law-practice/case-law-appeals.html). The website also provides an RSS feed for users wishing to be alerted to newly published decisions or to information on the Boards of Appeal generally.

I would like to thank the members of our Legal Research Service, who updated and revised the text for the present ninth edition. My thanks also go to the EPO Language Service, without whose co-operation the simultaneous publication in the three official languages would not have been possible and to all the other EPO staff who contributed to the production of the book's latest version.

I am confident that this new edition will once again provide you, the reader, with an invaluable source of information for your work.

Carl Josefsson
President of the Boards of Appeal

TABLE OF CONTENTS

FOREWORD TO THE NINTH EDITION	I
READER'S GUIDE	XIII
1. Abbreviations	XIII
2. Citations	XIV
3. Case numbers	XIV
I. PATENTABILITY	1
A. Patentable inventions	1
1. Patent protection for technical inventions	2
2. Non-inventions under Article 52(2) and (3) EPC	10
B. Exceptions to patentability	35
1. Introduction	36
2. Breaches of "ordre public" or morality	37
3. Patentability of biological inventions	43
4. Medical methods	52
C. Novelty	68
1. General	71
2. State of the art	71
3. Availability to the public	81
4. Determining the content of the relevant prior art	111
5. Ascertaining differences	127
6. Chemical inventions and selection inventions	134
7. First and second medical use	149
8. Second (or further) non-medical use	163
D. Inventive step	173
1. Introduction	175
2. Problem and solution approach	176
3. Closest prior art	178
4. Technical problem	187
5. "Could-would approach"	197
6. Ex post facto analysis	199

7.	Expectation of success, especially in the field of genetic engineering and biotechnology	200
8.	Skilled person	203
9.	Assessment of inventive step	212
10.	Secondary indicia in the assessment of inventive step	263
E.	The requirement of industrial application under Article 57 EPC	274
1.	Notion of "industrial application"	274
2.	Reproducibility and sufficiency of disclosure	277
3.	Indication of a profitable use of the invention in industry	278
II.	PATENT APPLICATION AND AMENDMENTS	281
A.	Claims	281
1.	Basic principles	282
2.	Form, content and conciseness of claims	283
3.	Clarity of claims	289
4.	Disclaimer	303
5.	Claims supported by the description	303
6.	Interpretation of claims	307
7.	Product-by-process claims	315
8.	Claims fees	319
B.	Unity of invention	322
1.	Introduction	322
2.	Unity in the context of different types of claims	323
3.	Assessing lack of unity of invention	327
4.	Criteria for determining lack of unity	332
5.	The single general inventive concept	334
6.	Plurality of inventions – further search fees	341
C.	Sufficiency of disclosure	347
1.	Introduction	348
2.	Date of compliance	348
3.	Parts of the application relevant for assessing sufficiency of disclosure	349
4.	Knowledge of skilled person relevant for assessing sufficiency of disclosure	351
5.	Clarity and completeness of disclosure	355
6.	Reproducibility	362
7.	The requirement of sufficiency of disclosure in the biotechnology field	371
8.	The relationship between Article 83 and Article 84 EPC	385
9.	Evidence	393

D.	Priority	398
1.	Introduction	399
2.	Applications giving rise to a right of priority	400
3.	Identity of invention	405
4.	First application in respect of the invention	416
5.	Partial and multiple priorities	420
E.	Amendments	428
1.	Article 123(2) EPC – added subject-matter	432
2.	Article 123(3) EPC – extension of the protection conferred	501
3.	Relationship between Article 123(2) and Article 123(3) EPC	523
4.	Correction of errors in the description, claims and drawings – Rule 139 EPC	530
5.	Evidence and standard of proof for allowing amendments and corrections	536
F.	Divisional applications	538
1.	Introduction	539
2.	Subject-matter of a divisional application	540
3.	Filing a divisional application	546
4.	Procedural questions	553
5.	Double patenting	556
III.	RULES COMMON TO ALL PROCEEDINGS BEFORE THE EPO	563
A.	The principle of the protection of legitimate expectations	563
1.	Applicability of the principle of the protection of legitimate expectations	564
2.	Information provided by EPO	568
3.	Obligation to draw attention to easily remediable deficiencies	572
4.	Obligation to enquire in case of unclear nature of request	577
5.	Legitimate expectation and case law	578
B.	Right to be heard	580
1.	Introduction	581
2.	The right to be heard under Article 113(1) EPC	582
3.	Text submitted or agreed by applicant (patent proprietor) – Article 113(2) EPC	606
C.	Oral proceedings	612
1.	Introduction	614
2.	Right to oral proceedings	614

3.	Oral proceedings at the instance of the EPO	616
4.	Request for oral proceedings	617
5.	Non-attendance at oral proceedings	623
6.	Preparation of oral proceedings	625
7.	Conduct of oral proceedings	638
8.	Costs	646
D.	Time limits, further processing and interruption of proceedings	648
1.	Calculation, determination and extension of time limits	648
2.	Further processing under Article 121 EPC	652
3.	Interruption of proceedings under Rule 142 EPC	653
E.	Re-establishment of rights	659
1.	Introduction	661
2.	Right to file request for re-establishment of rights	661
3.	Non-observance of time limit directly causing a loss of right	662
4.	Admissibility of requests for re-establishment of rights	665
5.	Merit of request for re-establishment of rights	676
6.	Procedural treatment of requests for re-establishment	702
7.	Rights of use under Article 122(5) EPC	705
8.	Principle of proportionality	705
9.	Reimbursement of the fee for re-establishment	707
F.	Languages	709
1.	Language of filing and date of filing of a European patent application	709
2.	Language of the proceedings	710
3.	Derogations from the language of the proceedings in written proceedings and in oral proceedings	710
4.	Language privilege	712
5.	Translations	712
6.	Language-related fee reductions	714
G.	Law of evidence	716
1.	Introduction	717
2.	Admissible evidence	720
3.	Taking of evidence	730
4.	Evaluation of evidence	741
5.	Burden of proof	767
H.	Interpretation of the EPC	780
1.	The Vienna Convention on the Law of Treaties	781
2.	Interpretation of the EPC affected by TRIPS Agreement	786

3.	The European Convention on Human Rights	787
4.	Impact of national decisions on the case law of the boards of appeal	788
5.	Decisions of the Administrative Council: boards of appeal not formally bound	789
6.	Implementing Regulations	790
7.	Changes in relation to an established practice and interpretation	791
8.	Interpretation of the various language texts of the EPC (Article 177 EPC)	791
I.	Main and auxiliary requests	793
1.	Possibility of filing auxiliary requests	793
2.	Order of requests	793
3.	Admissibility of requests	794
4.	Obligation to give reasons for refusal of each request	796
5.	Withdrawal of request	796
6.	Examination procedure	797
7.	Interlocutory decision on allowable auxiliary request – distinction between examination proceedings and opposition proceedings	798
8.	Opposition procedure	798
9.	Appeal procedure	799
J.	Suspected partiality	801
1.	General principles	802
2.	Initiation of partiality proceedings and other procedural issues	806
3.	Admissibility	808
4.	Suspected partiality of members of the departments of first instance	811
5.	Suspected partiality of members of the boards of appeal	813
6.	Suspected partiality of members of the Enlarged Board of Appeal	817
7.	Legal restrictions for former board members	820
K.	Formal aspects of decisions of EPO departments	822
1.	Composition of the competent departments of first instance	823
2.	Date of decision	827
3.	Form of decisions	828
4.	Loss of rights within the meaning of Rule 112(1) EPC	843
5.	Notification of decision under Rule 111(1) EPC	844
L.	Correction of errors in decisions	845
1.	Competence to correct a decision according to Rule 140 EPC	845
2.	Scope of Rule 140 EPC	846
3.	Obvious mistakes according to Rule 140 EPC	848
4.	Legal effect of corrections according to Rule 140 EPC	848
5.	Correction of printing errors in the publication of the patent specification	849
6.	Procedural status of third parties	850

M.	Inspection of files, European Patent Register and stay of proceedings	851
1.	Inspection of files	851
2.	European Patent Register	854
3.	Stay of proceedings under Rule 14(1) EPC	856
N.	Observations by third parties	860
1.	Introduction	860
2.	Formal requirements	861
3.	Third party's legal status	863
4.	Third-party observations in opposition-appeal proceedings	865
5.	Remittal following filing of observations	868
O.	Transfer of party status	869
1.	Party status as patent proprietor	869
2.	Party status as opponent	870
P.	Intervention	879
1.	Admissibility	879
2.	Legal status of intervener	884
Q.	Continuation of the opposition proceedings by the EPO	886
1.	Surrender and lapse of the patent	886
2.	Death or legal incapacity of an opponent	889
3.	Withdrawal of opposition	889
R.	Apportionment of costs	892
1.	Principle that each party must bear its own costs	892
2.	Equity of a different apportionment of costs – case groups	893
3.	Expenses that may be apportioned	913
4.	Procedural aspects	915
S.	Notifications	918
1.	Forms of notification	918
2.	Notification to representatives	920
3.	Notification to third parties	921
4.	Spheres of risk and apportioning the burden of proof	922

T.	Applications by non-entitled persons	924
U.	Rules relating to Fees	925
1.	General	925
2.	Payment of fees	926
3.	Date of payment	928
4.	Insufficient payments – small amounts lacking	929
5.	Reduction of the examination fee	930
6.	Partial refund of the examination fee	930
V.	Representation	931
1.	Overview	931
2.	Professional representatives	932
3.	Legal practitioners entitled to act as professional representative	935
4.	Authorisations for appointment of a representative	940
5.	Oral submissions by an accompanying person	946
W.	Guidelines for Examination in the European Patent Office	957
1.	Guidelines not binding on boards	957
2.	Guidelines binding (in principle) on departments of first instance	959
3.	The boards' application of the Guidelines in specific cases	961
IV.	PROCEEDINGS BEFORE THE DEPARTMENTS OF FIRST INSTANCE	965
A.	Preliminary and formalities examination	965
1.	Introduction	966
2.	Responsibility for formalities examination	966
3.	Where and how applications may be filed	967
4.	Persons entitled to file application	967
5.	Accordance of a date of filing	968
6.	Examination of formal requirements	978
7.	Designation of states	981
8.	Priority	985
9.	Deemed withdrawal of the application (Rule 100(3) EPC)	988
10.	Publication of the application	989
B.	Examination procedure	990
1.	Stage before substantive examination	992
2.	The first stage of substantive examination	994
3.	The grant stage in examination	1015
4.	Additional searches during examination	1039

5.	Amendments relating to unsearched subject-matter – Rule 137(5) EPC	1044
C.	Opposition procedure	1053
1.	Legal character of opposition proceedings and applicable principles	1055
2.	Filing and admissibility requirements	1056
3.	Substantive examination of opposition	1077
4.	Late submissions	1087
5.	Amendments in opposition proceedings	1097
6.	Right to be heard in opposition proceedings	1111
7.	Acceleration of opposition proceedings in the case of pending infringement proceedings	1117
8.	Decisions of opposition division	1118
D.	Limitation/revocation	1121
1.	Limitation/revocation – Article 105a-105c EPC	1121
2.	Requests for revocation during opposition and opposition appeal proceedings	1121
V.	PROCEEDINGS BEFORE THE BOARDS OF APPEAL	1125
A.	Appeal procedure	1125
1.	Legal character of appeal procedure	1133
2.	Filing and admissibility of the appeal	1138
3.	Substantive examination of the appeal	1182
4.	New submissions on appeal	1206
5.	Parallel proceedings	1270
6.	Termination of appeal proceedings	1270
7.	Remittal to the department of first instance	1275
8.	Binding effect of decision remitting case to department of first instance	1292
9.	Reimbursement of appeal fees	1296
B.	Proceedings before the Enlarged Board of Appeal	1330
1.	Introduction	1332
2.	Referral under Article 112 EPC	1332
3.	Petition for review under Article 112a EPC	1342
4.	Grounds for petition for review	1354
5.	Removal from office of a board member	1368
C.	Proceedings before the Disciplinary Board of Appeal	1370
1.	Introduction	1370
2.	European qualifying examination	1372

3.	Disciplinary matters	1386
4.	Code of Professional Conduct	1387
5.	Appeals against decisions of the Disciplinary Board of Appeal	1388
VI. THE EPO ACTING AS A PCT AUTHORITY – EURO-PCT APPLICATIONS		1391
1.	Introduction	1391
2.	Jurisdiction of the boards of appeal	1391
3.	Competence of the EPO acting as designated or elected Office	1392
4.	Language of the proceedings	1395
VII. INSTITUTIONAL MATTERS		1397
1.	Legal status of the EPO boards of appeal	1397
2.	Extension agreements and ordinances	1404
3.	Administrative agreements under Article 10(2)(a) EPC	1405
TABLE OF CASES		1407
	Decisions of the Disciplinary Board of Appeal	1407
	Decisions and opinions of the Enlarged Board of Appeal on referrals	1408
	Decisions of the Legal Board of Appeal	1411
	Decisions of the Enlarged Board of Appeal on petitions for review	1416
	Decisions of the Technical Boards of Appeal	1419
	PCT Protests	1488
INDEX OF CITED PROVISIONS		1491
1.	European Patent Convention	1491
2.	Implementing Regulations to the EPC	1501
3.	Rules relating to Fees	1508
4.	Patent Cooperation Treaty (articles and rules)	1509
5.	Regulation on the European qualifying examination for professional representatives	1509
6.	Regulation on discipline for professional representatives	1510
7.	Rules of Procedure of the Enlarged Board of Appeal	1510
8.	Rules of Procedure of the Boards of Appeal	1511

ANNEXES	1513
1. Rules of Procedure of the Enlarged Board of Appeal	1513
2. Rules of Procedure of the Boards of Appeal (RPBA 2007)	1522
3. Rules of Procedure of the Boards of Appeal – in force as from 1 January 2020	1531
4. Transitional provisions	1543
5. Cross-reference list EPC 1973 - EPC 2000	1545
6. General Index	1550

2. Citations

(a) The articles and rules of the EPC referred to are in the version valid at the time the decision was given.

(b) The text of the EPC as revised in 2000 and which entered into force in 2007 is cited without the attribute "2000". The text valid before that is cited as "EPC 1973".

(c) The Official Journal of the EPO is cited as OJ, followed by the year of publication and page number for publication prior to 2014 (eg OJ 2000, 322) and as OJ, followed by the year of publication and article for publication as of 2014 (eg OJ 2015, A102).

(d) If a decision of a board of appeal has been **published** in the OJ the reference is given.

If a decision has **not** been **published** in the OJ, normally only the case number is cited.

In the table of cases, the bibliographic data of all cited decisions (ie reference number, the board which took the decision, the date of the decision, and – where applicable – the citation in the OJ) are listed.

3. Case numbers

The case numbers comprise a **letter** followed by a sequence of **numbers**:

G	Decisions and opinions of the Enlarged Board of Appeal on referrals
R	Decisions of the Enlarged Board of Appeal on petitions for review
J	Decisions of the Legal Board of Appeal
T	Decisions of a Technical Board of Appeal
W	Decisions of a Technical Board of Appeal on protests under R. 40.2 or 68.3 PCT
D	Decisions of the Disciplinary Board of Appeal

The number before the oblique is a **serial number**, allocated by chronological order of receipt. The two numbers after the oblique indicate the **year of receipt** of the appeal.

2.5.3	Word-processing	30
2.6.	Presentations of information	31
2.6.1	User Interfaces	34

The four essential pre-conditions governing the patentability of inventions under the EPC are laid down in Art. 52(1) EPC, which reads: "European patents shall be granted for any inventions, in all fields of technology, provided that they are new, involve an inventive step and are susceptible of industrial application."

1. Patent protection for technical inventions

Art. 52(1) EPC expresses the fundamental principle of a general entitlement to patent protection for any invention in all technical fields (see G 5/83, OJ 1985, 64, point 21 et seq. of the Reasons; G 1/98, OJ 2000, 111, point 3.9 of the Reasons; G 1/03, OJ 2004, 413, point 2.2.2 of the Reasons; G 1/04, OJ 2006, 334, point 6 of the Reasons; T 154/04; OJ 2008, 46, 62, point 6 of the Reasons). Any limitation to the general entitlement to patent protection is thus not a matter of administrative or judicial discretion, but must have a clear legal basis in the EPC (see G 2/12, of 25.03.2015, OJ 2016, A28; T 154/04).

The technical character as a legal requirement of invention was expressly confirmed by the Conference of the Contracting States to Revise the EPC of 20 to 29 November 2000.

During the course of the revision of the EPC, Art. 52(1) EPC was brought into line with Art. 27(1), first sentence, TRIPS with a view to enshrining the word "technology" in the basic provision of substantive European patent law, clearly defining the scope of the EPC, and **explicitly** stating in the law that patent protection is available to **technical inventions of all kinds**. The new wording of Art. 52(1) EPC plainly expresses that patent protection is reserved for creations in the technical field (see OJ SE 4/2007, 48). The revised Art. 52 EPC applies to European patents granted and European patent applications pending on 13 December 2007 and to applications filed on or after that date.

Art. 52(2) EPC contains a non-exhaustive list of "**non-inventions**", that is, subject-matter or activities not to be regarded as inventions within the meaning of paragraph 1. The exclusion from patentability of the subject-matter or activities referred to applies only to the extent that a European patent application or European patent relates to such subject-matter or activities **as such** (Art. 52(3) EPC; see also OJ SE 4/2007). Art. 52(2) EPC covers subject-matter whose common feature is a substantial lack of technical character.

The application of Art. 52(1) EPC presents a problem of construction as there was no legal or commonly accepted definition of the term "invention" at the time of conclusion of the Convention in 1973. Moreover, the EPO has not developed any such explicit definition since. Art. 52(2) EPC is merely a negative, non-exhaustive list of what should not be regarded as an invention within the meaning of Art. 52(1) EPC. It was the clear intention of the contracting states that this list of "excluded" subject matter should not be given too broad a scope of application, as follows from the legislative history of Art. 52(2) EPC. Art. 52(3) EPC is a bar to a broad interpretation of Art. 52(2) EPC (T 154/04, point 6 of the Reasons; see also G 2/12, OJ 2016, A28).

1.1. Technical character of an invention

It has been part of the European legal tradition that patent protection should be reserved for technical creations. It was indeed always common ground that creations in engineering and technology were entitled to patent protection under the EPC (see e. g. T. 22/85, OJ 1990, 12; T. 154/04, OJ 2008, 46). The use of the term "invention" in Art. 52(1) EPC 1973 in conjunction with the so-called "exclusion provisions" of Art. 52(2) and (3) EPC 1973 was interpreted by the boards of appeal as **implying** a requirement of technical character or technicality to be fulfilled by an invention as claimed in order to be patentable (T. 931/95, T. 1173/97 and T. 935/97). Thus an invention may be an invention within the meaning of Art. 52(1) EPC if, for example, a technical effect is achieved by the invention or if **technical considerations** are required to carry out the invention. In T. 1173/97 (OJ 1999, 609) and T. 935/97 the board stated that within the context of the application of the EPC the technical character of an invention was generally accepted as an essential requirement for its patentability. In T. 931/95 (OJ 2001, 441) the board held that technical character was an implicit requirement of the EPC to be met by an invention in order to be an invention within the meaning of Art. 52(1) EPC 1973 (see also T. 1543/06).

In T. 154/04 (OJ 2008, 46) the board summarised the main principles underlying the relevant jurisprudence of the boards of appeal. The board held that "technical character" was an **implicit requisite** of an "invention" within the meaning of Art. 52(1) EPC 1973 (requirement of "technicality"). Art. 52(2) EPC 1973 did not exclude from patentability any subject matter or activity having a technical character, even if linked to items listed in this provision since these items were **only excluded "as such"** (Art. 52(3) EPC 1973). In examining the patentability of an invention in respect of a claim, the claim had to be construed to determine the **technical features** of the invention, i.e. the features which contributed to the technical character of the invention (see also T. 931/95, OJ 2001, 441, T. 914/02 and T. 1543/06). The board observed that the intention of Art. 52(3) EPC 1973 was clearly to ensure that anything which had previously been a patentable invention under conventional patentability criteria should remain patentable under the EPC.

In T. 619/02 (OJ 2007, 63) the board stated that, as had long been accepted, (see in this respect decisions T. 22/85, OJ 1990, 12, T. 931/95, OJ 2001, 441, and T. 258/03, OJ 2004, 575), the technical character of an invention constituted a fundamental prerequisite inherent to Art. 52 EPC 1973 – and was formulated as an explicit requirement in Art. 52(1) EPC. Thus, technical character constituted a **conditio sine-qua-non** to be met by an invention susceptible of patent protection under the EPC. Additionally, the board noted that a technical invention is generally useful and practical within the generic meaning of these terms, but the reverse is not necessarily true, i.e. not every "practical art" and not every entity or activity that is practical or useful is necessarily technical in the patent law sense (see T. 388/04, OJ 2007, 16). It was noted that in some national patent law systems, "useful" is the counterpart to the requirement of industrial applicability set out in Art. 57 EPC 1973 (see Note 5 to Art. 27(1) TRIPS); however, this special meaning of the term does not necessarily convey technical character either. Accordingly, considerations of usefulness and practicality are no substitute for, or criteria equivalent to the prerequisite of technical character inherent in the EPC. The board observed that although industrial

applicability and technical character of an invention are intimately related to each other (T. 854/90), they are not synonymous and constitute two distinct, non-equivalent requirements under the EPC 1973 (T. 953/94).

1.2. Separate and independently patentability requirements

Art. 52(1) EPC 1973 in conjunction with Art. 52(2) and (3) EPC 1973 is generally interpreted as implying a requirement of technical character for a claimed invention to be patentable. Whereas technical character was previously assessed using the "contribution approach", recent case law has abandoned this approach in favour of one which recognises the requirement of technical character as separate and independent of the remaining requirements of Art. 52(1) EPC, in particular novelty and inventive step, and compliance with which can therefore be assessed without having recourse to the prior art (T. 1543/06).

According to T. 154/04 (OJ 2008, 46), it was clear from the wording of Art. 52(1) EPC 1973 and the use of the term "invention" in the context of the criteria for patentability, that the requirements of invention, novelty, inventive step, and susceptibility of industrial application were separate and independent criteria, which might give rise to concurrent objections under any of these requirements. Novelty, in particular, was not a requisite of an invention within the meaning of Art. 52(1) EPC 1973, but a separate patentability requirement. This construction of Art. 52(1) EPC 1973 had a clear basis in the case law of the Enlarged Board of Appeal (G. 2/88, OJ 1990, 93 and G. 1/95, OJ 1996, 615).

1.3. Absolute and relative patentability requirements

In T. 154/04, OJ 2008, 46, the board indicated that the examination of whether there was an invention within the meaning of Art. 52(1) to (3) EPC 1973 should be strictly separated from and not confused with the examination of the other three patentability requirements referred to in Art. 52(1) EPC 1973. It distinguished the concept of "invention" as a general and absolute requirement of patentability from the relative criteria, novelty and inventive step, (which, in an ordinary popular sense, were understood to be the attributes of any invention), and the requirement of industrial applicability. Decisive for the presence of a (potentially patentable) invention was the inherent character of the claimed subject-matter.

1.4. Verification of the presence of an invention under Article 52(1) EPC

In T. 258/03, OJ 2004, 575 (see also T. 154/04, OJ 2008, 46), the board stated that the verification that claimed subject-matter is an invention within the meaning of Art. 52(1) EPC 1973 is, in principle, a **prerequisite** for the examination in respect of novelty, inventive step and industrial application, since these latter requirements were defined only for inventions (see Art. 54(1), 56, and 57 EPC 1973). The structure of the EPC therefore suggests that it should be possible to determine whether subject-matter was excluded under Art. 52(2) EPC 1973 without any knowledge of the state of the art (including common general knowledge).

1.4.1 Assessment of the invention independently of the prior art

a) Earlier case law of the boards of appeal: the "contribution approach"

In order to assess whether the claimed subject-matter was an invention within the meaning of Art. 52(1) EPC 1973, the boards of appeal applied, in their earlier case law, the so-called "contribution approach", according to which an invention had a technical character if it provided a technical contribution to the state of the art in a field not excluded from patentability under Art. 52(2) EPC 1973 (see T 121/85, T 38/86, OJ 1990, 384; T 95/86, T 603/89, OJ 1992, 230; T 71/91, T 236/91, T 833/91, T 77/92). The idea behind the so-called contribution approach was that the EPC 1973 only permitted patenting "in those cases in which the invention involves some contribution to the art in a field not excluded from patentability" (T 38/86, OJ 1990, 384). In other words, in order to assess the first requirement, i.e. the presence of an invention within the meaning of Art. 52(1) EPC 1973, a criterion was established which relied on meeting further requirements mentioned in that Article, in particular novelty and/or inventive step. Thus, some prior art was taken into account when determining whether subject-matter was excluded under Art. 52(2) and (3) EPC 1973 (T 258/03, OJ 2004, 575; see T 769/92, OJ 1995, 525).

b) Abandonment of the "contribution approach"

Subsequent decisions found any comparison with the prior art to be inappropriate for determining whether or not an invention was present.

In T 1173/97 (OJ 1999, 609) the board consciously abandoned the "contribution approach" and found that compliance with Art. 52(2), (3) EPC can be established by features already known in the art. Determining the technical contribution an invention achieves with respect to the prior art is more appropriate for the purpose of examining novelty and inventive step than for deciding on possible exclusion under Art. 52(2) and (3) EPC 1973. In T 931/95 (OJ 2001, 441) it was stated that there is no basis in the EPC for distinguishing between "new features" of an invention and features of that invention which are known from the prior art, when examining whether the invention concerned may be considered to be an invention within the meaning of Art. 52(1) EPC 1973. Thus there is no basis in the EPC for applying the so-called contribution approach for this purpose (see also; T 1001/99, T 388/04, OJ 2007, 16; T 619/02, OJ 2007, 63; T 553/02; T 258/03, OJ 2004, 575).

c) Some consequences of abandoning the contribution approach

Over a series of decisions the boards of appeal (and in particular Board 3.5.01) explored the consequences of abandoning the contribution approach (see G 3/08, OJ 2011, 10).

In T 931/95 (OJ 2001, 441), the board decided that an apparatus for carrying out an activity excluded as such from patentability by Art. 52(2) and (3) EPC 1973 was not itself excluded from patentability. In particular, a claim directed to a computer loaded with a program was not excluded from patentability by Art. 52(2) EPC 1973 even if the program itself would be, i.e. if the program caused no "further technical effect" when run. That decision did not however extend the logic to methods employing technical means (Headnote 2). The board

also held that, for the purpose of determining the extent of the exclusion under Art. 52(2) and (3) EPC 1973, the "further" technical effect could, in its opinion, be known in the prior art (see also T 1461/12, T 556/14).

With regard to methods, this decision was explicitly overturned by T 258/03 (Headnote 1); T 258/03 came to the conclusion that any claim involving technical means was not excluded from patentability by Art. 52(2) EPC 1973 (see points 3 and 4 of the Reasons). T 424/03, finally extended the reasoning applied in T 258/03 to come to the conclusion that a claim to a program ("computer executable instructions" in the claim in question) on a computer-readable medium also necessarily avoids exclusion from patentability under Art. 52(2) EPC 1973 (see Catchword 2 and point 5.3 of the Reasons).

1.4.2 Technical considerations and technical implementations

There might be an invention within the meaning of Art. 52(1) EPC 1973 if, for example, a **technical effect** was achieved by the invention or if **technical considerations** were required to carry out the invention (see T 931/95, OJ 2001, 441).

In G 3/08 (OJ 2011, 10) the Enlarged Board of Appeal could not identify a divergence in the case law of the boards of appeal, but noted that there was at least the potential for confusion, arising from the assumption that **any technical considerations** are sufficient to confer technical character on claimed subject-matter, a position which was apparently adopted in some cases (e.g. T 769/92).

In T 1173/97 the board noted that all computer programs have technical effects, since for example when different programs are executed they cause different electrical currents to circulate in the computer they run on. However such technical effects are not sufficient to confer "technical character" on the programs; they must cause **further technical effects**.

Thus, although it may be said that all computer programming involves technical considerations since it is concerned with defining a method which can be carried out by a machine, that in itself is not enough to demonstrate that the program which results from the programming has technical character; the programmer must have had technical considerations beyond "merely" finding a computer algorithm to carry out some procedure (G 3/08, point 13.5 of the Reasons; see also T 1358/09).

In T 914/02 the involvement of technical considerations, however, was **not sufficient** for a method, which might exclusively be carried out mentally, to have technical character. Technical character could be provided through the technical implementation of the method, resulting in the method providing a **tangible, technical effect**, such as the provision of a physical entity as the resulting product, or a non-abstract activity, such as through the use of technical means. The board rejected a claim directed to an invention involving technical considerations and encompassing technical embodiments on the grounds that the invention as claimed could also be exclusively performed by purely mental acts excluded from patentability under Art. 52(2)(c) EPC 1973.

In T.619/02 (OJ 2007, 63) the board stated that the prerequisite of technical character inherent to the EPC cannot be considered to be fulfilled by an invention, as claimed, which, although possibly encompassing technical embodiments, also encompasses ways of implementing it that do not qualify as technical. It followed that an invention is susceptible of patent protection within the meaning of Art. 52(1) EPC 1973 if, and only if the invention as claimed includes aspects that impart technical character to essentially all ways of performing the invention. An analogous condition applies in fact to the exclusions from patentability under Art. 52(2) EPC 1973, as illustrated by decision T.914/02 in which the corresponding board rejected a claim directed to an invention involving technical considerations and encompassing technical embodiments on the grounds that the invention as claimed could also be exclusively performed by purely mental acts excluded from patentability under Art. 52(2)(c) EPC (see also T.388/04, OJ 2007, 16, point 3 of the Reasons).

In T.306/04 the board pointed out that **the mere possibility** of serving a technical purpose or of solving a technical problem was not sufficient to avoid exclusion under Art. 52(2) and (3) EPC 1973 (see also T.388/04, OJ 2007, 16; T.1410/07).

In T.471/05 the fact that the claimed method encompassed non-excluded implementations did not overcome the fact that the claimed method also encompassed excluded subject-matter (T.453/91, T.914/02, points 2 and 3 of the Reasons; T.388/04, OJ 2007, 16; T.930/05). Thus, as long as the claimed design method was not confined to physical, technical implementations, the claimed subject-matter encompassed embodiments excluded from patentability under Art. 52(1) to 52(3) EPC 1973 and was not entitled to patent protection under the EPC.

1.4.3 Methods involving technical means

It is established case law of the boards of appeal that claimed subject-matter specifying at least one feature not falling within the ambit of Art. 52(2) EPC is not excluded from patentability by the provisions of Art. 52(2) and (3) EPC (G.3/08, OJ 2011, 10; T.258/03, T.424/03, T.1658/06, T.313/10).

According to T.258/03 (OJ 2004, 575) technical character results either from the physical features of an entity or (for a method) from the use of technical means. T.258/03 came to the conclusion that any claim involving technical means is not excluded from patentability by Art. 52(2) EPC, and since a claim directed to a method of operating a computer involved a computer it could not be excluded from patentability by Art. 52(2) EPC (see also G.3/08). The board noted that previous decisions of the boards of appeal had held that the use of technical means for carrying out a method for performing mental acts, partly or entirely without human intervention, might, having regard to Art. 52(3) EPC 1973, render such a method a technical process or method and therefore an invention within the meaning of Art. 52(1) EPC 1973 (T.38/86, OJ 1990, 384; T.769/92). However, method steps consisting of modifications to a business scheme and aimed at circumventing a technical problem rather than solving it by technical means could not contribute to the technical character of the subject-matter claimed.

The board in **T. 258/03** found that the technical character is determined by the presence or use of **technical means alone**, irrespective of purpose, even if that purpose is purely non-technical. This finding was irrespective of whether or not it can be associated with a technical effect or serves a technical purpose or function.

The board stated that what mattered, having regard to the concept of "invention" within the meaning of Art. 52(1) EPC 1973, was the presence of **technical character** which could be inferred from the physical features of an entity or the nature of an activity, or could be conferred on a non-technical activity by the use of technical means. In particular, the board held that the latter could not be considered to be a non-invention "as such" within the meaning of Art. 52(2) and (3) EPC 1973. Hence, in the board's view, activities falling within the concept of a non-invention "as such" would typically represent purely abstract concepts devoid of any technical implications. The board stated that its comparatively broad interpretation of the term "invention" in Art. 52(1) EPC 1973 would include activities which are so familiar that their technical character tends to be overlooked, such as the act of writing using pen and paper. However, this did not imply that all methods involving the use of technical means were patentable. They still have to be new, represent a non-obvious technical solution to a technical problem, and be susceptible of industrial application. The consequence was that, with regard to methods, **T. 931/95** (OJ 2001, 441) was explicitly overturned by **T. 258/03** (point 1 of the Headnote). In decision **T. 931/95** the board had stated that **using technical means** for a purely non-technical purpose and/or for processing purely non-technical information **did not necessarily** confer technical character on any such individual steps of use or on the method as a whole. The mere occurrence of technical features in a claim did not turn the subject-matter of the claim into an invention within the meaning of Art. 52(1) EPC 1973.

In **T. 38/86** (OJ 1990, 384) the board stated that the **use of technical means** for carrying out a method, partly or entirely without human intervention, which, if performed by a human being, would require him to perform mental acts, might, having regard to Art. 52(3) EPC 1973, render such a method a technical process or method and thus an invention within the meaning of Art. 52(1) EPC 1973.

1.4.4 Methods used in a technical process carried out on a physical entity

In accordance with the established case law, if a method which is not per se "technical" e.g. a mathematical method, is used in a technical process, and this process is carried out on a physical entity by some technical means implementing the method and provides as its result a change in that entity, it contributes to the technical character of the invention as a whole (**T. 1814/07**).

Any claimed subject-matter defining or using technical means is an invention within the meaning of Art. 52(1) EPC (see **T. 424/03** and **T. 258/03**, and confirmed in **G. 3/08**, OJ 2011, 10). Therefore the mere inclusion of a computer, a computer network, a readable medium carrying a program, etc. in a claim lends technical character to the claimed subject-matter.

Features of the computer program itself (see T 1173/97) as well as the presence of a device defined in the claim may potentially lend technical character to the claimed subject-matter (see T 769/92, OJ 1995, 525; T 424/03 and T 258/03).

1.4.5 Apparatus constituting a physical entity or concrete product

An apparatus for carrying out an activity excluded as such from patentability by Art. 52(2) and (3) EPC is not itself excluded from patentability. In particular, a claim directed to a computer loaded with a program is not excluded from patentability by Art. 52(2) EPC even if the program itself would be, i.e. if the program causes no "further technical effect" when run (T 931/95, OJ 2001, 441; see also G 3/08, OJ 2011, 10).

In T 931/95 (OJ 2001, 441) the board held that an apparatus constituting a physical entity or concrete product, suitable for performing or supporting an economic activity, was an invention within the meaning of Art. 52(1) EPC 1973. The board found that a computer system suitably programmed for use in a particular field, even if that was the field of business and economy, had the character of a concrete apparatus in the sense of a physical entity, man-made for a utilitarian purpose and was thus an invention within the meaning of Art. 52(1) EPC 1973. This distinction with regard to patentability between a method for doing business and an apparatus suited to perform such a method was justified in the light of the wording of Art. 52(2)(c) EPC 1973, according to which "schemes, rules and methods" were non-patentable categories in the field of economy and business, but the category of "apparatus" in the sense of "physical entity" or "product" was not mentioned in Art. 52(2) EPC 1973. This meant that, if a claim was directed to such an entity, the formal category of such a claim did in fact imply physical features of the claimed subject-matter which could qualify as technical features of the invention concerned and thus be relevant for its patentability. An apparatus constituting a physical entity or concrete product suitable for performing or supporting an economic activity, was an invention within the meaning of Art. 52(1) EPC 1973.

In T 258/03 (OJ 2004, 575) the board was not convinced that the wording of Art. 52(2)(c) EPC 1973, according to which "schemes, rules and methods for performing mental acts, playing games or doing business" shall not be regarded as inventions within the meaning of Art. 52(1) EPC 1973, imposed a different treatment of claims directed to activities and claims directed to entities for carrying out these activities. What matters having regard to the concept of "invention" within the meaning of Art. 52(1) EPC 1973 is the presence of technical character which may be implied by the physical features of an entity or the nature of an activity, or may be conferred on a non-technical activity by the use of technical means. The board held that the apparatus was an invention within the meaning of Art. 52(1) EPC 1973, since it comprised features which were clearly technical such as a "server computer", "client computers" and a "network". The board stated that this line of reasoning was independent of the category of the claim.

In T 2258/10 of 4 October 2011 the board found that any apparatus constituting a physical entity or concrete product has technical character. A cooking vessel clearly falls within this definition, and thus per se has technical character.

2. Non-inventions under Article 52(2) and (3) EPC

2.1. Introduction

Art. 52(2) EPC lists subject-matter or activities not regarded as inventions within the meaning of Art. 52(1) EPC. It states that in particular the following shall not be regarded as inventions within the meaning of paragraph 1; (a) discoveries, scientific theories and mathematical methods; (b) aesthetic creations; (c) schemes, rules and methods for performing mental acts, playing games or doing business, and programs for computers; (d) presentations of information.

Seeing as Art. 52(2), (3) EPC is a **limitation** to the general entitlement to patent protection laid down in Art. 52(1) EPC, it is not a matter of judicial discretion, but must have a clear legal basis in the EPC (cf. T 154/04, OJ 2008, 46; see also G 2/12, OJ 2016, A28).

According to T 930/05, the mere fact that the list of items not to be regarded as inventions in accordance with Art. 52(2) EPC 1973 was non-exhaustive, ("in particular"), indicated that there was a common criterion for exclusion which these items shared and which could serve as the basis for possible additions to the list. The enumeration of typical non-inventions in Art. 52(2) EPC 1973 covered subjects whose common feature was a lack of technical character. The catalogue of exclusions under Art. 52(2) EPC 1973, with its reference to Art. 52(1) EPC 1973, was to be regarded as a negative definition of the concept of invention.

The verification that claimed subject-matter is an invention within the meaning of Art. 52(1) EPC 1973 is in principle a **prerequisite** for the examination with respect to novelty, inventive step and industrial application since these latter requirements are defined only for inventions (cf Art. 54(1), 56, and 57 EPC 1973) (see T 258/03, OJ 2004, 575; see also T 154/04, OJ 2008, 46).

Art. 52(3) EPC states that paragraph (2) shall exclude the patentability of the subject-matter or activities referred to therein only to the extent to which a European patent application or European patent relates to such subject-matter or activities **as such**.

The case law clearly shows that this list of "excluded" subject-matter should not be given too broad a scope of application; Art. 52(3) EPC is a bar to a broad interpretation of Art. 52(2) EPC (G 2/12 and G 2/13, OJ 2016, A28 and A29; T 154/04).

In T 154/04 (OJ 2008, 46) the board stated that the enumeration of typical non-inventions in Art. 52(2) EPC 1973 was merely a negative, non-exhaustive list of what should not be regarded as an invention within the meaning of Art. 52(1) EPC 1973. It was the clear intention of the contracting states that this list of "excluded" subject matter should not be given too broad a scope of application. Thus Art. 52(3) EPC 1973 was introduced as a bar to such a broad interpretation of Art. 52(2) EPC 1973. By referring explicitly to the "patentability of the subject-matter or activities", paragraph 3 actually enshrined the entitlement to patent protection for the non-inventions enumerated in paragraph 2 – albeit restricting this entitlement by excluding patentability "to the extent to which the European

patent application or European patent relates to such subject matter or activities as such". That no paradigm shift was intended may also be seen from the fact that e.g. Switzerland as a contracting state considered it unnecessary ("überflüssig") to include the contents of Art. 52(2) and (3) EPC 1973 in the national regulations when harmonising them with the EPC 1973 (see "Botschaft des Bundesrates an die Bundesversammlung über drei Patentübereinkommen und die Änderung des Patentgesetzes", 76.021, 24 March 1976, page 67).

Further, the board held that "technical character" was an implicit requisite of an "invention" within the meaning of Art. 52(1) EPC 1973 (requirement of "technicality"). Art. 52(2) EPC 1973 **did not exclude from patentability** any subject matter or activity having technical character, even if linked to items listed in this provision since these items are **only excluded "as such"** (Art. 52(3) EPC 1973). In examining the patentability of an invention in respect of a claim, the claim had to be construed to determine the technical features of the invention, i.e. the features which contribute to the technical character of the invention. These principles had indeed a clear and consistent basis in the EPC and in the case law of the boards of appeal and the Enlarged Board of Appeal, in particular (see also G 3/08, OJ 2011, 10; T 931/95, OJ 2001, 441; T 914/02; T 2383/10).

For further information on the technical character of the invention, see in this chapter I.A.1.1. "Technical character of an invention".

The issue of inventions with technical and non-technical subject-matter of an invention (mixed inventions) is analysed in detail in sub-chapter "Treatment of technical and non-technical features", within the chapter I.D.9. "Assessment of inventive step".

2.2. Discoveries, scientific theories and mathematical methods

Art. 52 EPC sets out in paragraph (2) (a)-(d) a non-exhaustive list of items which are not regarded as an invention. This includes "Discoveries, scientific theories and mathematical methods" in (a). These activities share the common feature that they do not aim at any direct technical result but are rather of an abstract and intellectual character (see T 22/85, OJ 1990, 12; T 854/90, OJ 1993, 669; T 338/00).

2.2.1 Discoveries and scientific theories

If a new property of a known material or article is found out, that is mere discovery and unpatentable because discovery as such has no technical effect and is therefore not an invention within the meaning of Art. 52(1) EPC. If, however, that property is put to practical use, then this constitutes an invention which may be patentable. To find a previously unrecognised substance occurring in nature is also mere discovery and therefore unpatentable. However, if a substance found in nature can be shown to produce a technical effect, it may be patentable. In addition, if a microorganism is discovered to exist in nature and to produce an antibiotic, the microorganism itself may also be patentable as one aspect of the invention. Similarly, a gene which is discovered to exist in nature may be patentable if a technical effect is revealed, e.g. its use in making a certain polypeptide or in gene therapy (Guidelines G-II, 3.1 – November 2018 version).

It was recognised in **T.208/84** (OJ 1987, 14) that the fact that the idea or concept underlying the claimed subject-matter resides in a discovery does not necessarily mean that the claimed subject-matter is a discovery "as such" (**G.2/88**, OJ 1990, 93).

In **T.1538/05** the board noted that, speaking very generally, an invention must be of a technical character and must solve a technical problem with – at least partially – technical means. It found that the claims at issue related to the discovery of a scientific theory rather than a technical teaching. The appellant claimed to have discovered a magnetic force that was hitherto unknown, and as a consequence thereof, established that theories such as the Heisenberg uncertainty principle as well as Einstein's theory of relativity were wrong. These were scientific theories or discoveries of the laws of nature different from those established. The board was in no position to determine whether these physical theories and discoveries were correct or not. Neither the claims, nor the description gave any indication of a clear technical teaching. It was clear to the board that the subject-matter claimed by the appellant was not patentable, as the appellant had not demonstrated that they were of a technical nature and that the invention could be applied to processes or devices.

2.2.2 Mathematical methods

Purely abstract or intellectual methods are not patentable. The exclusion applies if a claim is directed to a purely abstract mathematical method and the claim does not require any technical means. If a claim is directed either to a method involving the use of technical means (e.g. a computer) or to a device, its subject-matter has a technical character as a whole and is thus not excluded from patentability under **Art. 52(2)** and **(3) EPC**.

Merely specifying the technical nature of the data or parameters of the mathematical method may not be sufficient to define an invention in the sense of **Art. 52(1) EPC**, as the resulting method may still fall under the excluded category of methods for performing mental acts as such (**Art. 52(2)(c)** and **(3) EPC**, see Guidelines G-II, 3.3 and 3.5.1 – November 2018 version).

Even if the idea underlying an invention may be considered to reside in a mathematical method a claim directed to a technical process in which the method is used does not seek protection for the mathematical method "as such" (**T.208/84**, OJ 1987, 14; **G.2/88**, OJ 1990, 93).

The case law of the boards of appeal has established that, if a method which is not per se "technical" e.g. a mathematical method, is used in a technical process, and this process is carried out on a physical entity by some technical means implementing the method and provides as its result a change in that entity, it contributes to the technical character of the invention as a whole. Thus this feature must be taken into account when assessing inventive step (**T.208/84**, OJ 1987, 14; **T.641/00**, **T.258/03**, **T.1814/07**, OJ 2003, 352).

In **T.1326/06** it was held that a method of encrypting/decrypting or signing electronic communications may be regarded as a technical method, even if it is essentially based on a mathematical method.

In T.208/84 (OJ 1987, 14) the method Claims 1-7 and 12 were directed to methods for digitally processing images. One basic issue to be decided was whether or not such a method was excluded from patentability under Art. 52(2) and (3) EPC 1973 on the ground that it was a mathematical method as such. The board noted that there could be little doubt that any processing operation on an electric signal can be described in mathematical terms. The characteristic of a filter, for example, can be expressed in terms of a mathematical formula. A basic difference between a mathematical method and a technical process can be seen, however, in the fact that a mathematical method or a mathematical algorithm is carried out on numbers (whatever these numbers may represent) and also provides a result also in numerical form, the mathematical method or algorithm being only an abstract concept prescribing how to operate on the numbers. No direct technical result is produced by the method as such. In contrast, if a mathematical method is used in a technical process, that process is carried out on a physical entity (which may be a material object but equally an image stored as an electric signal) by some technical means implementing the method and provides as its result a certain change in that entity. The technical means might include a computer comprising suitable hardware or an appropriately programmed general purpose computer. The board was, therefore, of the opinion that, even if the idea underlying an invention may be considered to reside in a mathematical method, a claim directed to a technical process in which the method is used does not seek protection for the mathematical method as such. In contrast, a "method for digitally filtering data" remains an abstract notion not distinguished from a mathematical method as long as it is not specified what physical entity was represented by the data and it forms the subject of a technical process, i.e. a process which is susceptible of industrial application (see also T.1161/04, T.212/94).

In T.953/94, claim 1 of the main request related to a method of generating with a digital computer a data analysis of the cyclical behaviour of a curve represented by a plurality of plots relating two parameters to one another (use of mathematical method in physical process). The board held that such a method could not be regarded as a patentable invention, because an analysis of the cyclical behaviour of a curve was clearly a mathematical method excluded as such from patentability. The reference to a digital computer only had the effect of indicating that the claimed method was carried out with the aid of a computer, i.e. a programmable general-purpose computer, functioning under the control of a program excluded as such from patentability. The fact that the description disclosed examples in both non-technical and technical fields was confirmation that the problem solved by the claimed mathematical method was independent of any field of application and could thus lie, in the case at issue, only in the mathematical and not in a technical field.

In T.27/97 the appellant (opponent) interpreted the claim to mean that its subject-matter, despite the statement that a method for use in electronic systems was involved, was confined to purely intellectual methods and thus excluded by Art. 52(2)(c) EPC 1973. The board disagreed, ruling that, according to claim 1, the application claimed a method, for use in electronic systems, of encrypting or decrypting a message (represented in the form of a digital word using RSA-type public-key algorithms). So the invention was clearly a method in the computer and telecommunications field and thus not excluded under

Art. 52(2) and (3) EPC 1973, even if based on an abstract algorithm or mathematical method.

In T 1326/06 the board took the view that processes for encoding/decoding or signing electronic communications by RSA had to be regarded as technical processes, even if they were based essentially on mathematical processes (see also decisions T 953/04, point 3.3 of the Reasons and T 27/97, point 3 of the Reasons).

In T 1784/06 (point 3.1.1 of the Reasons) the board stated that the algorithm is a mathematical (inter alia Boolean) method and mathematical methods as such are deemed to be non-inventions (Art. 52(2) and (3) EPC). A technical character of the algorithm could be recognised only if it served a technical purpose (see e.g. T 1227/05, point 3.1 of the Reasons, OJ 2007, 574) (see also T 306/10).

In T 556/14 the invention related to a method for masking a private key used in cryptographic operations on a security token such as a smartcard against power analysis attacks. The board held that due to the express reference to a smart card on which the key parts and also the new parts are stored, the claimed method of masking was not a mathematical method as such.

2.3. Aesthetic creations

Subject-matter relating to aesthetic creations will usually have both technical aspects, e.g. a 'substrate' such as a canvas or a cloth, and aesthetic aspects, the appreciation of which is essentially subjective, e.g. the form of the image on the canvas or the pattern on the cloth. If technical aspects are present in such an aesthetic creation, it is not an aesthetic creation 'as such' and it is not excluded from patentability. The aesthetic effect itself is not patentable, neither in a product nor in a process claim. Nevertheless, if an aesthetic effect is obtained by a technical structure or other technical means, although the aesthetic effect itself is not of a technical character, the means of obtaining it may be (Guidelines G-II, 3.4 – November 2018 version).

In T 686/90 the board was called upon to decide whether the feature "work of art in the style of stained glass" meant that it was excluded from patentability under Art. 52(2)(b) EPC 1973. The board held that functional information referring to general aesthetic creations did not define an aesthetic creation as such, at least provided that and insofar as such information adequately identified technical features of the subject-matter of the claim. Since an aesthetic creation (not formally specified) as the stated purpose, together with the other features, adequately defined a technical subject-matter in the claim, there was no aesthetic creation as such. For this reason there could be no objection to the claim under Art. 52(2)(b) EPC 1973 on the basis of Art. 52(3) EPC 1973.

In decision T 119/88 (OJ 1990, 395) the subject-matter of the application in question related to a flexible disk jacket made of a plastic sheet presenting to the outside world a surface colour of a certain minimum light intensity. The board first of all stated that the feature of having a specific colour as such did not constitute a technical feature indicating that an object or device was entirely or partly covered by that colour; however, the board

did not rule out the possibility that this did not hold in all circumstances. The feature taken by itself might not seem to reveal any technical aspect, but its technical or non-technical character could be decided by **the effect it brought about after being added to an object** which did not comprise the feature before (see e.g. T 336/14). In considering whether the subject-matter of a claim is excluded from patentability under Art. 52(2) and (3) EPC 1973, i.e. whether it is non-technical or technical, that claim has to be considered in its entirety. This is in line with decisions T 38/86 and T 65/86, in which Art. 52(3) EPC 1973 was interpreted to mean that the subject-matter of a claim is not excluded from patentability under Art. 52(2)(c) EPC 1973 if the said subject-matter contributes anything to the prior art in a field that is not excluded from patentability. In these decisions this interpretation was only applied with regard to Art. 52(2)(c) EPC 1973. However, once applied to Art. 52(2)(c) EPC 1973 it must hold for all the paragraphs of Art. 52(2) EPC 1973, since Art. 52(3) EPC 1973 refers to all the items summed up in Art. 52(2) EPC 1973. The board stated that it had to be investigated whether the effects implied by the sole feature of possessing a specific colour, could make that feature into a feature not excluded from patentability the known object or device provided with that colour. The board concluded that the alleged resistance to fingerprints was a purely aesthetic effect which contributed nothing technical to the invention concerned (Art. 52(2)(b) EPC 1973) and the advantage of easy classification by colour represented a non-technical effect in the form of a presentation of information. As such it was excluded from patentability under Art. 52(2)(d) and (3) EPC 1973 (see also T 962/91).

In T 617/11 the appellant I (opponent I) considered that there was no objective technical problem to be solved since the alleged obtained effects related to aesthetic effects. It argued that features could not be regarded as technical and justify patentability if their effects related to the subjective senses of the viewer (T 119/88, OJ 1990, 395) and concluded that, since all the features of claim 1 related to non-technical effects of colours and shapes, the claimed container could not be regarded as a patentable invention (Art. 52(2)(b) and (d) EPC). The board noted that the case law of the boards of appeal in relation to the technicality of inventions and the exclusions from patentability as provided in Art. 52(2) EPC was summarised in T 154/04 (OJ 2008, 46) for inventions which have a mix of technical and non-technical features. The fact that the non-technical features provide the only contribution over the known prior art and thus lead to the conclusion of non-patentability under Art. 52(2) EPC, as held in T 119/88 (supra), had clearly been overruled by the large body of jurisprudence on this issue, as summarised in T 154/04 and established by the decisions citing T 154/04 for this aspect. Hence, the board could not find fault with the reasoning and the findings of the opposition division.

For more information on the inventive-step analysis in connection with features relating to subject-matter excluded under Art. 52(2) EPC, see chapter I.D.9.1.2 "Inventions having both technical and non-technical features".

2.4. Computer-implemented inventions

2.4.1 Introduction

"Computer-implemented invention" is an expression intended to cover claims which involve computers, computer networks or other programmable apparatus wherein at least one feature is realised by means of a computer program. A computer program and a corresponding computer-implemented method are distinct from each other. The former refers to a sequence of computer-executable instructions specifying a method while the latter refers to a method being actually performed on a computer. Claims directed to a computer-implemented method, a computer-readable storage medium or a device cannot be objected to under Art. 52(2) and (3) EPC as any method involving the use of technical means (e.g. a computer) and any technical means itself (e.g. a computer or a computer-readable storage medium) have technical character and thus represent inventions in the sense of Art. 52(1) EPC. (T 258/03; T 424/03; G 3/08, OJ 2011, 10; Guidelines G-II, 3.6 – November 2018 version).

Art. 52(2)(c) EPC states that programs for computers shall not be regarded as inventions within the meaning of Art. 52(1) EPC and are therefore excluded from patentability.

Art. 52(3) EPC establishes an important limitation to the scope of this exclusion. According to this provision, the exclusion applies only to the extent to which a European patent application or a European patent relates to programs for computers "as such". In T 935/97 the board stated that the combination of the two provisions (Art. 52(2) and (3) EPC 1973) demonstrates that the legislators did not want to exclude from patentability all programs for computers. In other words the fact that only patent applications relating to programs for computers as such are excluded from patentability means that patentability may be allowed for patent applications relating to programs for computers where the latter are not considered to be programs for computers as such.

According to the early case law of the boards of appeal, the view was taken on a number of occasions that exclusion under Art. 52(2)(c) and (3) EPC 1973 applied to all computer programs, independently of their contents, that is, independently of what the program could do or perform when loaded into an appropriate computer (see T 1173/97; OJ 1999, 609). To make a distinction between programs with a technical character and those with a non-technical character would not be allowed under such reasoning. Some examples of such reasoning could be found for instance in decisions T 26/86 (OJ 1988, 19, point 3.1 of the Reasons), T 110/90 (OJ 1994, 557, point 5 of the Reasons), and T 204/93 (point 3.13 of the Reasons). For example, in T 204/93, the board held that computer programs as such, independent of their application, were not patentable irrespective of their content, even if that content happened to be such as to make it useful, when run, for controlling a technical process. The board ruled that, "similarly", a programmer's activity of programming was, "as a mental act", not patentable, irrespective of whether the resulting program could be used to control a technical process, and that automating that activity in a way which did not involve any unconventional means did not render that programming method patentable either, independently of the content of the resulting program.

2.4.2 Patentability of computer programs

In T 1173/97 (OJ 1999, 609) (see also T 935/97) the board stated that within the context of the application of the EPC the technical character of an invention is generally accepted as an essential requirement for its patentability. This is illustrated, for instance, by R 27 and 29 EPC 1973. The exclusion from patentability of programs for computers as such (Art. 52(2) and (3) EPC 1973) may be construed to mean that such programs are considered to be mere abstract creations, lacking in technical character. The use of the expression "shall not be regarded as inventions" seems to confirm this interpretation. This means that programs for computers must be considered as patentable inventions when they have a technical character.

Further, Art. 27(1) TRIPS provides that "patents shall be available for any inventions, whether **products or processes**, in all fields of technology". The board went on to state that it was the clear intention of TRIPS not to exclude from patentability any inventions, whatever field of technology they belong to, and therefore, in particular, not to exclude programs for computers as mentioned in and excluded under Art. 52(2)(c) EPC 1973. Thus, the board of appeal decided that the practice of the EPO under Art. 52(2) and (3) EPC 1973 should be changed in certain respects in relation to claims to computer programs. In these decisions it was held that the exclusion of computer programs "as such" did not encompass all programs for computers. The board held that a computer program product is not excluded from patentability under Art. 52(2) and (3) EPC 1973 if the program, when running on a computer or loaded into a computer, brings about, or is capable of bringing about, a technical effect which goes beyond the "normal" physical interactions between the program (software) and the computer (hardware) on which it is run.

The board stated that, according to the case law of the boards of appeal, a claim directed to the use of a computer program for the solution of a technical problem could not be regarded as seeking protection for the program as such within the meaning of Art. 52(2)(c) and (3) EPC 1973, even if **the basic idea underlying the invention** could be considered to reside in the computer program itself, as illustrated, for example, by decisions T 208/84 (OJ 1987, 14) and T 115/85 (OJ 1990, 30). The case law thus allowed an invention to be patentable when the basic idea underlying the invention resided in the computer program itself. The combination of the two provisions (Art. 52(2) and (3) EPC 1973) demonstrated that the legislators did not want to exclude from patentability all programs for computers. In other words the fact that only patent applications relating to programs for computers as such were excluded from patentability meant that patentability could be allowed for patent applications relating to programs for computers where the latter were not considered to be programs for computers as such. In order to establish the scope of the exclusion from patentability of programs for computers, it was necessary to determine the exact meaning of the expression "as such". This could result in the identification of those programs for computers which, as a result of not being considered programs for computers as such, were open to patentability.

2.4.3 Programs for computers and technical character

a) Further effects of programs for computers

In T. 1173/97 (OJ 1999, 609) and T. 935/97 the board found that a computer program must be considered to be patentable when it has technical character. For the purpose of interpreting the exclusion from patentability of programs for computers under Art. 52(2) and (3) EPC 1973, the board assumed that **programs for computers** could not be considered as having a technical character for the very reason that they are programs for computers. This means that physical modifications of the hardware (causing, for instance, electrical currents) deriving from the execution of the instructions given by programs for computers cannot per se constitute the technical character required for avoiding the exclusion of those programs. Although such modifications may be considered to be technical, they are a common feature of all those programs for computers which have been made suitable for being run on a computer, and therefore cannot be used to distinguish programs for computers with a technical character from programs for computers as such. It was thus necessary to look elsewhere for technical character in the above sense: It could be found in the **further effects** deriving from the execution (by the hardware) of the instructions given by the computer program. The board stated that every computer program product produced an effect when the program concerned was made to run on a computer. The effect only showed in physical reality when the program was being run. Thus the computer program product itself did not directly disclose the said effect in physical reality. It only disclosed the effect when being run and consequently only possessed the "potential" to produce said effect. This effect might also be technical in the sense explained in reason 6 of the decision, in which case it constituted the "further technical effect" mentioned there. This meant that a computer program product might possess the potential to produce a "further" technical effect.

Once it had been clearly established that a specific computer program product, when run on a computer, brought about a technical effect in the above sense, the board saw no good reason for distinguishing between a direct technical effect on the one hand and the potential to produce a technical effect, which could be considered as an indirect technical effect, on the other hand. A computer program product might therefore possess a technical character because it had the potential to cause a predetermined further technical effect in the above sense.

The board concluded that on condition they were able to produce a technical effect in the above sense, all computer programs had to be considered as inventions within the meaning of Art. 52(1) EPC 1973, and might be the subject-matter of a patent if the other requirements provided for by the EPC were satisfied.

b) Technical effect on a physical entity

The President of the EPO referred the following point of law to the Enlarged Board of Appeal (G. 3/08, OJ 2011, 10; Question 3(a) of the referral): must a claimed feature cause a **technical effect on a physical entity** in the real world in order to contribute to the technical character of the claim? It was noted in the referral that according to decisions

T.163/85 and T.190/94, a technical effect **on a physical entity** in the **real world** was required. This was, however, not the case in T.125/01 and T.424/03. In these decisions the technical effects were essentially confined to the respective computer programs.

The Enlarged Board of Appeal stated in Opinion G 3/08 (OJ 2011, 10) that the case law of the boards of appeal as a whole is consistent in considering all the features that are claimed. The boards have always avoided approaches which involve weighting of features or a decision which features define the "essence" of the invention. It is true that the COMVIK/Hitachi (T.641/00, T.258/03) approach to deciding whether there is an inventive step may involve ignoring some features, but the method starts with a consideration of all the features together to determine whether the claimed subject-matter has a technical character. Only once this determination has been made can the board turn to the question of which claimed features contribute to that technical character and therefore should be taken into account for the assessment of whether there is an inventive step (see also T.528/07).

The Enlarged Board of Appeal went on and stated that it is in fact a well-established principle that features which would, taken in isolation, belong to the matters excluded from patentability by Art. 52(2) EPC may nonetheless contribute to the technical character of a claimed invention, and therefore cannot be discarded in the consideration of the inventive step. This principle was already laid down, albeit in the context of the so-called "contribution approach", in one of the earliest decisions of the boards of appeal to deal with Art. 52(2) EPC, namely T.208/84.

The second problem with the alleged divergence was that the decisions T.163/85 and T.190/94 said in the referral to require a technical effect on a physical entity in the real world, simply did not do so. They merely accepted this as something sufficient for avoiding exclusion from patentability; they did not state that it was necessary. The referral did not identify any passages requiring such an effect and the Enlarged Board could not find any. Thus there was no divergence. The other two decisions cited considered that there were technical effects; whether the boards concerned considered that these technical effects were on a physical entity in the real world was irrelevant. This question was therefore found inadmissible.

c) Technical considerations: programming a computer

It is not specified in the EPC whether, or under which circumstances, the activity associated with creating programs for computers, i.e. programming a computer, is a technical activity which is in principle patentable, or a non-technical activity which is as such excluded from patentability.

The President of the EPO referred to the Enlarged Board of Appeal the following point of law (see G 3/08, OJ 2011, 10; Question 4 of the referral): Does the activity of programming a computer necessarily involve technical considerations? The President of the EPO cited decision T.1177/97, where the board found that "implementing a function on a computer system always involves, at least implicitly, technical considerations". The reference to 'computer routines' made it clear that this implementation consisted of programming the

computer (see also T.172/03). Contrary to these decisions T.833/91, T.204/93 and T.769/92 (OJ 1995, 525) considered programming to be a mental act of the programmer.

In Opinion G.3/08 (OJ 2011, 10) the Enlarged Board of Appeal considered that the referral asserted correctly that T.1177/97 considered that programming always involved technical considerations, at least implicitly, and that T.172/03 assumed the same in that it considered the skilled person, who, it was emphasised, was a technical expert, to be a software project team, consisting of programmers. On the other hand, T.833/91, T.769/92 (OJ 1995, 525) and T.204/93, were said to consider the programmer's activity, programming, to be a mental act, falling within the exclusions of Art. 52(2) EPC.

The Enlarged Board stated that there was no contradiction between these positions, as may be seen by considering the same case in a non-controversial field, for example bicycle design. Designing a bicycle clearly involves technical considerations (it may also involve non-technical, e.g. aesthetic, considerations), but it is a process which at least initially can take place in the designer's mind, i.e. it can be a mental act and to the extent that it is a mental act would be excluded from patentability (cf. also T.833/91, T.769/92, T.204/93, T.914/02 and T.471/05). Hence the question did not satisfy the requirement for a divergence in the case law and was therefore inadmissible.

While the referral did not actually identify a divergence in the case law, the Enlarged Board of Appeal considered that there was at least the potential for confusion, arising from the assumption that **any technical considerations** were sufficient to confer technical character on claimed subject-matter, a position which was apparently adopted in some cases (e.g. T.769/92). T.769/92 (OJ 1995, 525) was an example of an invention which concerned the internal functioning of a computer caused by the programs running on it. According to this decision the fact that technical considerations were required in order to arrive at the invention was considered to lend sufficient technical character to the invention as claimed for it to avoid exclusion from patentability under Art. 52(2)(c) and (3) EPC 1973, whereas no importance was attributed to the specific use of the system as a whole.

However, T.1173/97 set the barrier higher in the case of computer programs. It argued that all computer programs have **technical effects**, since for example when different programs are executed they cause different electrical currents to circulate in the computer they run on. However such technical effects are **not sufficient** to confer "technical character" on the programs; they must cause **further technical effects**. In the same way, it seemed to this board, that although it may be said that all computer programming involves technical considerations since it is concerned with defining a method which can be carried out by a machine, that in itself is not enough to demonstrate that the program which results from the programming has technical character; the programmer must have had technical considerations beyond "merely" finding a computer algorithm to carry out some procedure.

The board in T.1173/97 concentrated on the effect of carrying out an algorithm on a computer, noting that there were always technical effects, which led the board, since it recognised the position held by the framers of the EPC, to formulate its requirement for a "further" technical effect. Only if a computer program, when run, produced **further**

technical effects, was the program to be considered to have a technical character. In the same way, it would appear that the fact that fundamentally the formulation of every computer program requires technical considerations in the sense that the programmer has to construct a procedure that a machine can carry out, is not enough to guarantee that the program has a technical character (or that it constitutes "technical means" as that expression is used in e.g. T. 258/03). By analogy one would say that this is only guaranteed if writing the program requires "further technical considerations".

In T. 598/14 the application related to a method for generating, from an input set of documents, a word replaceability matrix defining semantic similarity between words occurring in the input document set. The board considered that the translation, with the aim of enabling the linguistic analysis to be done automatically by a computer, could be seen as involving, at least implicitly, technical considerations. This was also in line with decision T. 1177/97 or opinion G 3/08 (OJ 2011, 10). However, according to G 3/08, point 13.5 of the Reasons, this is not enough to guarantee the technical character of subject-matter otherwise excluded from patentability under Art. 52(2) and (3) EPC. The technical character would have to be established on the basis that those considerations constituted "further technical considerations". The board concluded that the subject-matter of independent claim 1 lacked an inventive step (Art. 52(1) EPC and 56 EPC).

d) Technical considerations: implementation of a function on a computer system

In T. 1177/97 claim 1 was directed to a method for translation between natural languages; accordingly, it used various linguistic terms and involved linguistic aspects of the translation process. The board raised the question whether such linguistic concepts and methods could form part of a technical invention at all. It referred to EPO case law which provided various examples showing that even the automation of such methods did not make good a lack of technical character (e.g. T. 52/85). On the other hand, coded information had been considered, on a case-by-case basis, as a patentable entity, i.a. T. 163/85, OJ 1990, 379; T. 769/92, OJ 1995, 525 and T. 1194/97, OJ 2000, 525. The board confirmed that, in accordance with this case law, it seemed to be common ground that the use of a piece of information in a technical system, or its usability for that purpose, could confer a technical character on the information itself, in that it reflected the properties of the technical system, for instance by being specifically formatted and/or processed. When used in or processed by the technical system, such information could be part of a technical solution to a technical problem and thus form the basis for a technical contribution of the invention to the prior art.

In so far as technical character was concerned, the board stressed that it should be irrelevant that the piece of information was used or processed by a conventional computer, or any other conventional information processing apparatus, since the circumstance that such an apparatus had become a conventional article for everyday use did not deprive it of its technical character, just as a hammer still had to be regarded as a technical tool even though its use had been known for millennia. The board thus came to the conclusion that information and methods related to linguistics could in principle assume a technical character if they were used in a computer system and formed part of a technical problem solution. Implementing a function on a computer system **always involved technical**

considerations, at least implicitly, and meant in substance that the functionality of a technical system was increased. The implementation of the information and methods related to linguistics as a computerised translation process similarly required technical considerations and thus provided a technical aspect to per se non-technical things such as dictionaries, word matching or the translation of compound expressions into a corresponding meaning. Features or aspects of the method which reflected only peculiarities of the field of linguistics, however, had to be ignored in assessing inventive step.

Decision T.115/85 (OJ 1990, 30) concerned a method for displaying one of a set of predetermined messages comprising a phrase made up of a number of words, each message indicating a specific event which might occur in the input-output device of a word processing system which also included a keyboard, a display and a memory. The board observed that automatically giving visual indications of conditions prevailing in an apparatus or a system was basically a technical problem. The application proposed a solution to this technical problem involving the use of a computer program and certain tables stored in a memory. It adopted the principle laid down in decision T.208/84: an invention which would be patentable in accordance with conventional patentability criteria should not be excluded from protection by the mere fact that for its implementation modern technical means in the form of a computer program are used. However, it did not follow from this that conversely a computer program could under all circumstances be considered as constituting technical means. In the case in question the subject-matter of the claim, phrased in functional terms, was not barred from protection by Art. 52(2)(c) and (3) EPC 1973 (see also T.790/92).

e) Methods performed by a computer

In T.258/03 (OJ 2004, 575) the board held that a method involving technical means is an invention within the meaning of Art. 52(1) EPC 1973 (as distinguished from decision T.931/95, OJ 2001, 441). Thus with regard to methods, decision T.931/95 was explicitly overturned by T.258/03. If the claimed method requires the use of a computer, it has technical character and constituted an invention within the meaning of Art. 52(1) EPC (see T.258/03, T.1351/04, T.313/10). Since a claim directed to a method of operating a computer involved a computer it could not be excluded from patentability by Art. 52(2) EPC (G.3/08, OJ 2011, 10).

In T.313/10 the examining division had argued, using their own criteria, that a method performed by a computer was excluded. The first issue in this case was whether the claimed method, performed by a computer, of matching items in a table is excluded from patentability (Art. 52(2) and (3) EPC). The board stated that it is the established case law of the boards of appeal that claimed subject-matter specifying **at least one feature** not falling within the ambit of Art. 52(2) EPC is not excluded from patentability by the provisions of Art. 52(2) and (3) EPC (see G.3/08, OJ 2011, 10; T.258/03 and T.424/03).

The board noted that the technical character might come from within, namely from the effect on the computer. This was the case, for example in T.424/03 where the technical effect came from "functional data structures (clipboard formats) used independently of any

cognitive content...in order to enhance the internal operation of a computer system". Such "functional data structures" were also considered to be present in the file search method that was the subject of T.1351/04.

f) Computer-implemented simulation methods

In T.1227/05 (OJ 2007, 574) the application related to a computer-implemented method with mathematical steps for simulating the performance of a circuit subject to $1/f$ noise. The board noted that while the invention may be preceded by a mental or mathematical act, the claimed result must not be equated with this act. The claims related to a simulation method that could not be performed by purely mental or mathematical means, not to the thought process that led to that simulation method. The board was persuaded that the claimed simulation of a circuit constituted neither a mathematical method as such nor a computer program as such, even if mathematical formulae and computer instructions were used to perform the simulation. The board noted that simulation performed technical functions typical of modern engineering work. It provided for realistic prediction of the performance of a designed circuit and thereby ideally allowed it to be developed so accurately that a prototype's chances of success could be assessed before it was built. The technical significance of this result increased with the speed of the simulation method, as this enabled a wide range of designs to be virtually tested and examined for suitability before the expensive circuit fabrication process started. Without technical support, advance testing of a complex circuit and/or qualified selection from many designs would not be possible, or at least not in reasonable time. Thus computer-implemented simulation methods for virtual trials were a practical and practice-oriented part of the electrical engineer's toolkit. What made them so important was that as a rule there was no purely mathematical, theoretical or mental method that would provide complete and/or fast prediction of circuit performance under noise influences.

As regards the potential exclusion of computer programs, the board stood by its earlier ruling that this exclusion did not apply to computer-implemented methods, see T.424/03. For the above reasons, in the board's view, all steps relevant to circuit simulation – and that included the mathematically expressed claim features – contributed to the technical character of the simulation method.

In this context the board noted that the above conclusion could not be drawn from the mere observation that a claimed method runs faster than a "conceivable" reference method. As it was always possible to conceive of a slower reference method, a mere speed comparison was not a suitable criterion for distinguishing between technical and non-technical procedural steps (see also T.1954/08). If, for example, a sequence of auction steps led to price determination more quickly than some other auction method, that did not necessarily imply that the auction steps contribute to the technical character of the method (see T.258/03).

The board concluded that, as the method according to independent claim 1 or 2 was computer-implemented, it used technical means and by that very token had technical character (see T.258/03, OJ 2004, 575 and T.914/02). The board was persuaded that simulation of a circuit subject to $1/f$ noise constituted an adequately defined technical

purpose for a computer-implemented method, provided that the method was **functionally limited** to that technical purpose. Specific technical applications for **computer-implemented simulation methods** were themselves to be regarded as modern technical methods which formed an essential part of the fabrication process and preceded actual production, mostly as an intermediate step. In that light, such simulation methods could not be denied a technical effect merely on the grounds that they did not yet incorporate the physical end product.

Finally, the computer program according to claim 4 (data medium holding a computer program) had the potential for a technical effect going beyond basic hardware/software interaction in a standard computer. Loaded onto a computer it provides for automatic simulation and evaluation of noise-affected circuits. The computer program thus does not come under the program exclusion (see T.1173/97, OJ 1999, 609, point 6.5 of the Reasons).

In T.953/94, the board found allowable a method of controlling a "physical" process using a mathematical model. However, a reference to an unspecified "physical process" might, according to more recent jurisprudence, be rejected as a "meta-specification" (see e.g. T.1227/05, OJ 2007, 574; T.1147/05; T.1029/06).

In T.1265/09 the board noted that it followed from T.1227/05 that steps relevant to a simulation of a technical item contribute to the technical character of the simulation method only if certain conditions, as cited above, are met. Leaving aside the question of whether these conditions were indeed sufficient to contribute to a technical character, the board noted that, in any case, these conditions were not met in the case at issue, since, in connection with the call handling simulation referred to in claim 1, the telephone call center and, in particular, its performance, were not further specified in the claim and, further, the claimed method did not define the further steps which actually resulted in the stated purpose, i.e. the call handling simulation.

In T.531/09 the board noted that definition of technical processes seemed to exclude **simulations**, whose very purpose is to replace physical entities by virtual ones. In decision T.208/84 the board had held (at point 5 of the Reasons) that a technical process is different from a mathematical method in that the technical process is carried out on a physical entity and provides, as its result, a certain change in that entity. T.1227/05 went beyond the earlier decision in holding that the simulation of an adequately defined class of technical items could be a functional technical feature. In T.1265/09, referring to T.1227/05, the board left open the question whether it is a sufficient condition for a simulation to be patentable that the simulated items be technical, noting that the simulated system (in that case, call handling in a telephone call center) was not technical, so that the condition did not hold. The present board found itself in a similar situation. It came to the conclusion that the condition was not fulfilled in the case at issue. Simulation of a checkpoint is not inherently technical. The board saw claim 1 according to the main request as defining a simulation, on a computer, of a non-technical process, which happens to include some technical devices, and considered that the only feature that made a contribution to inventive step was the fact that the simulation is performed on a computer.

2.4.4 Claims on computer programs

a) Computer program recorded on the medium

After the abandonment of the contribution approach, the boards of appeal finally dealt with the question whether a claim to a program on a computer-readable medium avoided exclusion in **T 424/03**. **T 424/03** extended the reasoning applied in **T 258/03** to come to the conclusion that a claim to a program ("computer executable instructions" in the claim in question) on a computer-readable medium also necessarily avoids exclusion from patentability under Art. 52(2) EPC (see also **G 3/08**, OJ 2011, 10; point 10.7 of the Reasons).

T 424/03 of 23.02.2006 concerned an application disclosing a method of providing expanded clipboard formats for transferring data between formats. The clipboard was a storage area used in the common computer commands "cut", "copy" and "paste". Claim 1 related to a method implemented in a computer system. A computer system including a memory (clipboard) was a technical means, and consequently the claimed method had technical character in accordance with established case law. Moreover, the board emphasised that **a method implemented in a computer system** represented a sequence of steps actually performed and achieving an effect, and not a sequence of computer-executable instructions (i.e. **a computer program**) which just had the potential of achieving such an effect when loaded into, and run on, a computer. The board held that the claim category of a computer-implemented method was **distinguished from** that of a computer program. Even though a method, in particular a method of operating a computer, might be put into practice with the help of a computer program, a claim relating to such a method did not claim a computer program in the category of a computer program. Hence, in the case a issue, claim 1 could not relate to a computer program as such.

The board also considered that the claimed method steps contributed to the technical character of the invention. These steps solved a technical problem by technical means in that functional data structures (clipboard formats) were used independently of any cognitive content (see **T 1194/97**, OJ 2000, 525) in order to enhance the internal operation of a computer system with a view to facilitating the exchange of data among various application programs. The claimed steps thus provided a general purpose computer with a further functionality – the computer assisted the user in transferring non-file data into files.

In the same case claim 5 was directed to a computer-readable medium having "computer-executable instructions" (i.e. a computer program) on it to cause the computer system to perform the claimed method. The board found that the subject-matter of claim 5 had technical character since it related to a computer-readable medium, i.e. a technical product involving a carrier (see also **T 258/03**, OJ 2004, 575). Moreover, the computer-executable instructions had the potential of achieving the above-mentioned **further technical effect** of enhancing the internal operation of the computer, which went beyond the elementary interaction of any hardware and software of data processing (**T 1173/97**, OJ 1999, 609). The computer program recorded on the medium was therefore not considered to be a computer program as such, and thus also contributed to the technical character of the

claimed subject-matter. The particular program involved had therefore the potential of achieving a **further technical effect** when run and thus also contributed to the technical character of the claimed subject-matter.

b) Exclusion of computer programs under Article 52(2) and (3) EPC

The President of the EPO, making use of her power under Art. 112(1)(b) EPC, made a referral to the Enlarged Board of Appeal on several points of law relating to the application of the exclusion of computer programs as such, and the limits of patentability in the field of computing. In particular, the President of the EPO referred to the Enlarged Board of Appeal the following point of law (see G 3/08, Question 1 of the referral), "Can a computer program only be excluded as a computer program as such if it is explicitly claimed as a computer program?"

In Opinion G 3/08 (OJ 2011, 10), the Enlarged Board of Appeal held that a claim utilising a synonym for "computer program", such as "a sequence of computer-executable instructions" or "an executable software module" perhaps, would clearly not avoid exclusion from patentability if the equivalent claim to a computer program did not. It noted that the alleged divergence identified in the referral did not simply relate to the form of words chosen. The discussion also referred to "the function of the computer program (does the claimed program have technical character) rather than the manner in which it is claimed (e.g. as a computer program, a computer program product or a computer-implemented method)".

The Enlarged Board of Appeal noted that in T 424/03 the board had arrived at a conclusion which clearly contradicted the position (or rather one of the positions) taken in T 1173/97 (OJ 1999, 609). T 1173/97 stated, "Furthermore, the board is of the opinion that with regard to the exclusions under Art. 52(2) and (3) EPC, it does not make any difference whether a computer program is claimed by itself or as a record on a carrier ...," (point 13 of the Reasons), whereas T 424/03 stated, "The subject-matter of claim 5 has technical character since it relates to a computer-readable medium, i.e. a technical product involving a carrier" (see decision T 258/03, point 5.3 of the Reasons). Thus there was a difference between the positions taken in T 1173/97 and T 424/03 on this point. It was still however necessary to decide whether this difference constitutes a divergence allowing a question to be referred by the President on the point.

The Enlarged Board of Appeal pointed out that the referral did not identify, and they were not aware of, any decision whatsoever of one of the boards of appeal of the EPO which followed T 1173/97 on this point (although T 1173/97 was evidently considered decisive in its definition of "further technical effect" and abandonment of the contribution approach to exclusion). Secondly, the conclusion arrived at in T 424/03 had not been challenged in any later decisions; nor was it isolated but rather came as the last of a series of decisions, the logic of which was consistent and, at least to the knowledge of the members of the Enlarged Board, had also not been challenged in any later decision of a board of appeal of the EPO (national court decisions were another matter).

The Enlarged Board of Appeal came to the conclusion that the position taken in T 424/03 that a claim to a program on a computer-readable storage medium was necessarily not excluded from patentability by the provisions of Art. 52(2) and (3) EPC 1973 was in fact a consequence of the principles laid out in T 1173/97. It stated that T 424/03, did deviate from a view expressed in T 1173/97, concerning whether a claim to a program on a computer-readable medium necessarily avoided exclusion from patentability under Art. 52(2) EPC 1973. However this was a legitimate development of the case law. Therefore, the Enlarged Board of Appeal decided that there was no divergence which would make the referral of this point to the Enlarged Board of Appeal by the President admissible (for further legal considerations which were taken into account in that regard, see points 5 to 7 of Opinion G 3/08).

In G 3/08 (OJ 2011, 10) (Question 2 of the referral), the Enlarged Board of Appeal stated that a claim in the area of computer programs can avoid exclusion under Art. 52(2)(c) and (3) EPC merely by explicitly mentioning the use of a computer or a computer-readable storage medium. It noted however that no exposition of this position would be complete without the remark that it is also quite clear from the case law of the boards of appeal since T 1173/97 that if a claim to program X falls under the exclusion of Art. 52(2) and (3) EPC, a claim which specifies no more than "Program X on a computer-readable storage medium," or "A method of operating a computer according to program X," will always still fail to be patentable for lack of an inventive step under Art. 52(1) and 56 EPC.

The Enlarged Board of Appeal also noted that in T 424/03 (extending the reasoning applied in T 258/03) the board held that claim to a program ("computer executable instructions" in the claim in question) on a computer-readable medium also necessarily avoided exclusion from patentability under Art. 52(2) EPC. The decision in T 424/03 went on to note that the particular program involved had the potential of achieving a **further technical effect** when run and thus also contributed to the technical character of the claimed subject-matter. The Enlarged Board of Appeal stated that this fact was, however, not necessary to the conclusion that the claimed subject-matter avoided exclusion, since according to the reasoning of T 258/03 **any technical means** claimed was **sufficient** to overcome the exclusion of Art. 52(2) EPC.

2.5. Schemes, rules and methods for performing mental acts, playing games or doing business

According to Art. 52(2)(c) EPC, schemes, rules and methods for performing mental acts, playing games or doing business are not to be regarded as inventions.

2.5.1 Methods for doing business

In accordance with Art. 52(2)(c) EPC, in particular methods for doing business shall not be regarded inventions within the meaning of Art. 52(1) EPC. According to Art. 52(3) EPC the patentability of such methods shall only be excluded to the extent that the application, and indeed the claimed subject-matter as this defines the matter for which protection is sought, relates to methods for doing business as such. However, where the claimed

method involves technical means, it does not relate to a method for doing business as such and its patentability is therefore not excluded (see also T.258/03, OJ 2004, 575).

Pure business methods as such are not patentable (Art. 52(2) and (3) EPC 1973). Methods only involving economic concepts and practices of doing business are not inventions within the meaning of Art. 52(1) EPC 1973. A feature of a method which concerns the use of technical means for a purely non-technical purpose and/or for processing purely non-technical information does not necessarily confer a technical character on such a method (see e.g. T.931/95, OJ 2001, 441).

In T.931/95 (OJ 2001, 441) the board addressed the patentability of inventions relating to business methods. Claim 1 of the main request was directed to a **method** for controlling a pension benefits program by administering at least one subscriber employer account. The board stated that if the method was technical or, in other words, had a technical character, it still might be a method for doing business, but not a method for doing business as such. However, all the features of claim 1, i.e. the individual steps defining the claimed method, were steps of processing and producing information having purely administrative, actuarial and/or financial character. Processing and producing such information were typical steps of business and economic methods. Thus the invention as claimed did not go beyond a method of doing business as such and was excluded from patentability under Art. 52(2)(c) EPC 1973 in conjunction with Art. 52(3) EPC 1973.

In T.854/90 (OJ 1993, 669), a computer manufacturer applied to patent a method for operating an electronic self-service machine (e.g. cash dispenser) which could be accessed using any machine-readable card. A prospective user first had to insert such a card to enable its identification data to be stored; he then keyed in credit information about himself onto an "electronic application form", thereby permitting a decision to be taken on whether to authorise him as a user. Once authorised, he could access the system using that same card. The board ruled that this was not patentable – parts of the method claimed were merely instructions for using the machine, and although technical components were used, this did not alter the fact that what was being claimed was a method for doing business as such. The board held that a claim which, when taken as a whole, is essentially a business operation, does not have a technical character and is not a claim to a patentable invention within the meaning of Art. 52(1) EPC 1973, even though the claimed method includes steps which include a technical component. The true nature of the claimed subject-matter remains the same, even though some technical means are used to perform it.

A method of doing business is excluded from patentability even where it implies the possibility of making **use of unspecified technical means** or has practical utility (T.388/04).

In T.388/04 (OJ 2007, 16) the board considered that transmitting information as specified in the claim, even if performing the transmission might involve the use of technical means, does not go beyond a business activity as such. If the contrary were true, no method for doing business that implicitly could make use of a functionality offered by technical means would be excluded from patentability, which, in the view of the board, could not be what is

intended by Art. 52(2) and (3) EPC 1973. The board held that subject-matter or activities that are excluded from patentability under Art. 52(2) and (3) EPC 1973 remain so even where they imply the possibility of making use of **unspecified technical means**.

In T. 384/07 the method claimed included features corresponding to technical means for the technical implementation of the business scheme, such as a data processing terminal connected to a network of data processing terminals etc. The board held that the method did not constitute a method for doing business as such, and, therefore, was not excluded from patentability in accordance with Art. 52(2) and (3) EPC 1973.

2.5.2 Methods for performing mental acts

The use of technical means for carrying out a method for performing mental acts, partly or entirely without human intervention, might, having regard to Art. 52(3) EPC 1973, render such a method a technical process or method and therefore an invention within the meaning of Art. 52(1) EPC 1973 (T. 38/86, OJ 1990, 384; see also T. 258/03, OJ 2004, 575).

In T. 471/05 the board pointed out that claim 1 merely formulated a series of mathematical and optical abstract concepts without properly requiring a physical, technical implementation. It followed that the subject-matter for which protection is sought was the mere "design" of an optical system and encompasses purely abstract and conceptual implementations excluded from patent protection pursuant to Art. 52(1), (2) and (3) EPC 1973. More particularly, the claimed method could be carried out as a purely mental act or as a purely mathematical design algorithm and, consequently, encompasses embodiments falling within the category of methods for performing mental acts as such and within the category of mathematical methods as such both expressly excluded from patent protection under Art. 52(2)(a) and (c) EPC 1973 in conjunction with Art. 52(3) EPC 1973.

The board stated that the criteria for technical character of a claimed invention discussed in decision T. 619/02 (OJ 2007, 63) implicitly presupposed that the claimed subject-matter defining the matter for which protection is sought related to a **physical entity or a physical activity**. It could not be denied that the method defined in claim 1 of the main request could be carried out using some physical means and that such implementations of the claimed method constitute physical, technical activities not excluded from patent protection (see for instance decisions T. 914/02, and T. 258/03, OJ 2004, 575). Nonetheless, contrary to the appellant's contention, the claimed method **did not require the use of technical means** and the method was not restricted to physical, technical implementations, and the fact that the claimed method encompassed **non-excluded implementations** such as those mentioned above did not overcome the fact that the claimed method **also encompassed excluded subject-matter** (T. 914/02, and T. 388/04, OJ 2007, 16; see also T. 453/91, T. 930/05). Thus, as long as the claimed design method was not confined to physical, technical implementations, the claimed subject-matter encompassed embodiments excluded from patentability under Art. 52(1) to (3) EPC 1973 and was not entitled to patent protection under the EPC. The board also stated that the mere presence in the claim of such purely conceptual technical considerations did not

overcome the conclusion above that the claim merely formulated a sequence of mathematical and optical concepts without properly requiring a technical or even a physical implementation. In particular, a purely mental implementation of the claimed method remains a mental act as such within the meaning of Art. 52(2) and (3) EPC 1973 even if the mental act involves conceptual technical considerations as already concluded in decision T.914/02 in which a method claim involving technical considerations and encompassing technical embodiments was refused on the grounds that the invention as claimed could still be exclusively performed by purely mental acts. In view of the above the subject-matter defined in claim 1 of the main request was excluded from patent protection under Art. 52(1), (2) and (3) EPC 1973.

In T.603/89 (OJ 1992, 230) the invention consisted of an apparatus for and a method of learning how to play a keyboard instrument, where numbers corresponding to notes on a sheet of music also appeared on the keys. The technical feature claimed was the marking of the keys. Patentability was ruled out by Art. 52(2)(c) and (d) EPC 1973. Since the key markings were merely known technical features, the contribution made by the claimed invention to the working of the teaching apparatus lay solely in the content of the information displayed, not in the apparatus itself. The invention was not based on a technical problem, but on an improvement to a teaching method, which was equivalent to an improvement to a method for performing mental acts.

2.5.3 Word-processing

In T.22/85 (OJ 1990, 12) the board had to decide on the patentability of a method for automatically abstracting and storing an input document in an information storage and retrieval system and a corresponding method for retrieving a document from the system. The board observed that the described method fell within the category of activities defined in Art. 52(2)(c) EPC 1973. It considered that the mere setting out of the sequence of steps necessary to perform the activity in terms of functions or functional means to be realised with the aid of conventional computer hardware elements did not import **any technical considerations** and could therefore neither lend a technical character to the activity nor to the claimed subject-matter considered as a whole, any more than solving a mathematical equation could be regarded as a technical activity when a conventional calculation machine is used (see also T.186/86, T.95/86).

In T.38/86 (OJ 1990, 384) the board first of all had to assess the patentability of a method for automatically detecting and replacing linguistic expressions which exceeded a predetermined level of understanding in a list of linguistic expressions. The board was of the opinion that a person who wished to carry out such a task using his skills and judgment would perform purely mental acts within the meaning of Art. 52(2)(c) EPC 1973; the schemes, rules and methods used in performing such mental acts were not inventions within the meaning of Art. 52(1) EPC 1973. The board stated that the use of technical means for carrying out a method, partly or entirely without human intervention, which, if performed by a human being, would require him to perform mental acts, **might**, having regard to Art. 52(3) EPC 1973, render such a method a technical process or method and thus an invention within the meaning of Art. 52(1) EPC 1973. Since patentability was excluded only to the extent to which the patent application related to excluded subject-

matter or activities as such, it appeared to be the intention of the EPC to permit patenting in those cases in which the invention involved a contribution to the art in a field not excluded from patentability. In the case in point this condition was not satisfied: once the **steps of the method for performing the mental acts** in question had been defined, the implementation of the technical means to be used in those steps involved no more than the straightforward application of conventional techniques and had therefore to be considered obvious to a person skilled in the art. If a claim for an apparatus (here, a word processing system) for carrying out a method did not specify any technical features beyond those already comprised in a claim pertaining to said method and furthermore did not define the apparatus in terms of its physical structure, but only in functional terms corresponding to the steps of that method, the board stated that the claimed apparatus did not contribute anything more to the art than the method, in spite of the fact that the claim was formulated in a different category. In such cases, if the method was excluded from patentability, so was the apparatus (see also T.71/91, T.121/85).

In T.110/90 (OJ 1994, 557) the invention was for a method of transforming a first editable document form prepared using a batch word processing system into a second editable document form for use on an interactive or batch word processing system. Following T.163/85 (OJ 1990, 379) the board found that control items (e.g. printer control items) included in a text represented in the form of digital data were characteristic of the word-processing system in which they occurred in that they were characteristic of the technical internal working of that system. Such control items therefore represented technical features of the word-processing system in which they occurred. Consequently, transforming control items which represented technical features belonging to one word-processing system into those belonging to another word-processing system constituted a method of a technical nature.

T.95/86 related to an invention that involved text editing on a computer display. The board stated that the activity of editing a text is principally concerned with linguistic and layout features of a text. The method as such aims at solving a problem which is essentially of a non-technical nature. The board, therefore, found that the activity of text editing as such must be considered as falling within the category of schemes, rules and methods for performing mental acts and therefore as excluded from patentability under Art. 52(2)(c) and (3) EPC (following T.186/86).

2.6. Presentations of information

Presentation of information in the sense of Art. 52(2)(d) EPC is understood as the conveying of information to a user. It concerns both the cognitive content of the information presented and the manner of its presentation (T.1143/06, T.1741/08). However, it does not extend to the technical means used for generating such presentations of information. Furthermore, conveying information to a user is to be distinguished from technical representations of information directed to a technical system which will process, store or transmit that information. Features of data encoding schemes, data structures and electronic communication protocols which represent functional data as opposed to cognitive data are not regarded as presentations of information in the sense of Art. 52(2)(d) EPC (T.1194/97; Guidelines G-II, 3.7 – November 2018 version).

In T. 1194/97 (OJ 2000, 525) the board held that a record carrier characterised by having functional data recorded thereon is not a presentation of information as such and hence not excluded from patentability by Art. 52(2)(d) and (3) EPC 1973. In this context functional data includes a data structure defined in terms (here coded picture line synchronisations, line numbers, and addresses) which inherently comprise the technical features of the system (here read device plus record carrier) in which the record carrier is operative (extending T. 163/85, OJ 1990, 379). In order to lend additional support to its view in relation to a data structure product, the board also referred to decision T. 1173/97 (OJ 1999, 609) and, in particular, to the observation made in that decision at point 9.4 of the reasons to the effect that the predetermined potential technical effect of a program recorded on a carrier could endow such a product with technical character sufficient to overcome the exclusions under Art. 52(2) and (3) EPC 1973 (see also T. 858/02).

In T. 1749/06 the board agreed with the finding of T. 1194/97. Presentation of information arises when "what is displayed" is claimed without specifying "how it is displayed". Claim 1 comprised the feature of an icon formed of dark and white stripes having thus a three-dimensional effect, but did not comprise the icon's cognitive content, i.e. its specific shape. The latter feature, i.e. the icon representing e.g. a butterfly, was a presentation of information, but not the former. The board found for these reasons that the features of the characterizing portion of claim 1 did not fall under the category of presentation of information within the meaning of Art. 52(2)(d) EPC.

In T. 125/04 the board was of the opinion that, in general, the task of designing diagrams was non-technical (see T. 244/00 of 15 November 2001). This was so even if the diagrams arguably conveyed information in a way which a viewer might intuitively regard as particularly appealing, lucid or logical.

In T. 599/93 a configuration for simultaneously displaying several images on one (computer) screen was claimed. The screen was divided into four sections, for example by means of one horizontal and one vertical demarcation line. The board was of the view that imparting information on events in a screen window by changing the colour of the relevant surface of the setting mark was not of a technical nature (no information was given, for example, on the operating status of the claimed configuration), but merely drew the user's attention to particular contents of the relevant images and thus served to present information within the meaning of Art. 52(2)(d) EPC 1973 (T. 1704/06).

In T. 1086/07 the board considered that, in general, the idea of displaying and placing an indicator at a position to identify a location has no technical character. It is a presentation of information, namely the results of the summarising process, and has no interaction with the possibly technical function of producing it. A similar conclusion was reached in decision T. 603/89 (OJ 1992, 230) in connection with a kind of template that displayed numbers on a card to represent notes on a keyboard instrument. The board noted that although the jurisprudence on Art. 52(2) EPC 1973 was somewhat different at the time, the judgment of technical character was essentially the same.

In T. 528/07 the appellant cited several decisions of the boards of appeal in order to demonstrate that the display of data can have technical character. The board found that

two different interpretations of decision **T 115/85** existed in the jurisprudence: either the visual indications must concern technical conditions of the system in order to relate to a technical problem (**T 833/91**), or they may also concern non-technical conditions (**T 717/05**). The board in the case at issue followed the more restrictive approach according to which only technical conditions of a system can be taken into account. This line has also been taken in other decisions of the boards of appeal (see e.g. **T 790/92**; **T 953/94**; **T 1161/04**; **T 1567/05**; **T 756/06**). Moreover, the clear character of this approach as an exception appears to be more consistent with the exclusion of "presentations of information" pursuant to **Art. 52(2)(d) EPC**.

In **T 1073/06** the application related to generating a display of a **simulation model** including objects linked by relationships, for instance a proportional relationship. The appellant had argued that an objective technical problem could be seen in improving the ease with which a user can construct such a simulation model, the claimed solution avoiding the "drilling down" required in the prior art to understand the relationships between the objects in the simulation model.

The board judged, however, that an improvement in the comprehension of a model is a purely mental effect, so that the problem solved was not seen as being technical. Further, the solution was also not seen as having any technical implications beyond, possibly, routine implementation details, being simply a choice of where and in what form in a process of visualisation of a model to display certain information, i.e. an issue of "presentations of information", as mentioned in **Art. 52(2)(d) EPC**. On its broadest interpretation, the simulation model, of which the relationship conditions between objects were a part, could be of a wholly abstract nature and thus a system of equations which were merely a mathematical method and thus non-technical. The claimed "graphical link representations" related to the state of the simulation model, rather than to the state of the claimed simulation apparatus, and thus constituted presentations of information and were therefore also non-technical; see **T 528/07**.

In **T 163/85** (OJ 1990, 379), regarding a colour television signal characterised by technical features of the system in which it occurred, the board considered it appropriate to distinguish between two kinds of information when discussing its presentation; according to this distinction, a TV system solely characterised by the information per se, e.g. moving pictures modulated on a standard TV signal, might fall under the exclusion of **Art. 52(2)(d) and (3) EPC 1973**, but not a TV signal defined in terms which inherently comprised the technical features of the TV system in which it occurred; as the list of exclusions from patentability set out in **Art. 52(2) EPC 1973** (in conjunction with **Art. 52(3) EPC 1973**) was not exhaustive in view of the phrase "in particular", the exclusion might arguably be generalised to subject-matter which was essentially abstract in character, non-physical and therefore not characterised by technical features within the meaning of **R. 29(1) EPC 1973**.

In decision **T 1143/06** the board noted that a non-technical claim feature is a feature which does not interact with the technical features to produce a technical effect. According to the jurisprudence of the boards of appeal such a feature cannot establish novelty and inventive step (**T 154/04**, OJ 2008, 46, point 15 of the Reasons). Since the invention was concerned

with the visualisation of data files Art. 52(2)(d) EPC was obviously relevant. If the new features of a claim concern the presentation of information itself (rather than its concrete implementation) a patent can only be granted if they also produce a technical effect. If they do not they cannot contribute to an inventive step. One example of such a case was T. 125/04 concerning a new kind of vector diagram. The deciding board stated that "i/n general, the task of designing diagrams is non-technical. This is so even if the diagrams arguably convey information in a way which a viewer may intuitively regard as particularly appealing, lucid or logical" (Catchword). Another example was decision T. 619/98, in which it was held that an action performed by a user in response to a message in the form of questions or suggestions concerning the technical functioning of an apparatus did not render the form of the information technical.

2.6.1 User Interfaces

User interfaces, in particular graphical user interfaces (GUIs), comprise features of presenting information and receiving input in response as part of human-computer interaction. Features defining user input are more likely to have a technical character than those solely concerning data output and display, because input requires compatibility with the predetermined protocol of a machine, whereas output may be largely dictated by the subjective preferences of a user (Guidelines G-II, 3.7.1 – November 2018 version).

There is well-established case law which considers a graphical user interfaces layout (GUI) as such to be non-technical, being a "presentation of information" (Art. 52(2)(d) EPC) (see T. 1143/06; T. 1741/08).

The issues of GUI layout and presentation of information in the assessment of inventive step is analysed in detail in sub-chapter "Assesment of features relating to a presentation of information", within the chapter I.D.9. "Assessment of inventive step".

4.5.2 Case law applying the principles developed in G 1/04	67

1. Introduction

Art. 53 EPC defines three exceptions to patentability: (a) inventions the commercial exploitation of which would be contrary to 'ordre public' or morality; (b) plant varieties or animal species or essentially biological processes for the production of plants or animals; this does not apply to microbiological processes or the products thereof; (c) methods for treatment of the human or animal body by surgery or therapy and diagnostic methods practised on the human or animal body; this does not apply to products, in particular substances or compositions, for use in any of these methods.

1.1. Amendments made to Article 53 EPC as part of the EPC 2000 revision

As part of the EPC 2000 revision, several amendments were made to Art. 53 EPC. However, these are unlikely to affect the EPO's practice (see OJ SE 4/2007): Art. 53(a) EPC was brought into line with Art. 27(2) TRIPS and Art. 6(1) of Directive 98/44/EC on the legal protection of biological inventions ("Biotech Directive"). In the German version, moreover, the term "Tierarten" in Art. 53(b) EPC 1973 was replaced by "Tierrassen" to bring it into line with the Biotech Directive and R. 23c(b) EPC 1973 (MR/2/00, 45).

In addition, the exclusion of medical methods which had previously been enshrined in Art. 52(4) EPC 1973 was transferred to Art. 53(c) EPC. These methods had formerly been excluded from patentability through the legal fiction that they were not susceptible of industrial application. However, since medical methods are excluded from patentability

mainly in the light of public health considerations, it appeared appropriate to include these inventions also under exceptions to patentability (MR/2/00, 45).

1.2. Basic principles

No general exclusion of inventions in the sphere of animate nature can be inferred from the EPC (T 49/83, OJ 1995, 545). It was held in T 356/93 (OJ 1995, 545) that seeds and plants per se should not constitute an exception to patentability under Art. 53(a) EPC 1973 merely because they represented 'living' matter, or on the ground that plant genetic resources should remain the 'common heritage of mankind'.

The case law indicates that any exceptions to patentability must be narrowly construed. In respect of Art. 53(a) EPC, see T 356/93 (OJ 1995, 545) and T 866/01, but also T 1374/04 (OJ 2007, 313); in respect of Art. 53(b) EPC, see T 320/87 (OJ 1990, 71), T 19/90 (OJ 1990, 476) and T 315/03 (OJ 2006, 15); regarding Art. 53(c) EPC (Art. 52(4) EPC 1973) see T 144/83 (OJ 1986, 301), T 385/86 (OJ 1988, 308) and G 1/04 (OJ 2006, 334).

Given the ratio legis of the individual provisions, however, this narrow interpretation produces different results: a claim which embraces plant/animal varieties, but does not claim them individually, is not excluded from patentability under Art. 53(b) EPC (G 1/98, OJ 2000, 111; T 19/90, OJ 1990, 476; T 315/03, OJ 2006, 15). According to the established case law of the boards of appeal, a method claim falls under the prohibition of Art. 53(c) EPC if it includes at least one feature defining a physical activity or action that constitutes a method step for treatment of the human or animal body by surgery or therapy (see in this chapter I.B.4.2.). By contrast, several method steps are required to define a diagnostic method within the meaning of Art. 53(c) EPC owing to the inherent and inescapable multi-step nature of such a method (G 1/04, OJ 2006, 334). In T 19/90 it was also stated that the object and purpose of the law (ratio legis) was not merely a matter of the legislator's intention at the time when the law was adopted, but also of their presumed intention in the light of changes in circumstances which had taken place since then.

2. Breaches of "ordre public" or morality

In the past, this issue has arisen mainly in connection with biotechnological inventions.

Art. 53(a) EPC is supplemented by R. 28 EPC, which sets out four categories of biotechnological inventions excluded from patentability under that article. R. 28 EPC is part of the chapter on "Biotechnological inventions" inserted into Part II of the Implementing Regulations, and is identical to Art. 6(2) of the Biotech Directive. The Biotech Directive was thereby transposed into European patent law.

Where an invention falls under one of the categories set out in R. 28 EPC, it is by its very nature non-patentable and there is no need additionally to consider Art. 53(a) EPC. However, if it does not fall under one of those categories, it must be examined more closely under Art. 53(a) EPC (T 315/03, OJ 2006, 15; see also G 2/06, OJ 2009, 306).

R. 29 EPC governs the patentability of the human body and its components. Under R. 29(2) EPC (R. 23e(2) EPC 1973), an element isolated from the human body or otherwise produced by a technical process, including the sequence or a partial sequence of a gene, may constitute a patentable invention, so that an invention falling under this category is not excluded from patentability pursuant to Art. 53(a) EPC (T 272/95 of 23 October 2002); see also T 1213/05).

2.1. Rule 28 EPC

R. 28 EPC, which sets out four non-patentable categories, entered into force on 1 September 1999 as R. 23d EPC 1973. It applies equally to applications pending on, i.e. filed before, the date of its entry into force (G 2/06, T 315/03).

2.1.1 Scope of exception under Rule 28(c) EPC

Under R. 28(c) EPC (R. 23d(c) EPC 1973), European patents may not be granted in respect of biotechnological inventions which concern "uses of human embryos for industrial or commercial purposes". The expression "uses for industrial or commercial purposes" in R. 28(c) EPC covers the making of the claimed product, even where it was intended to use that product for further research (G 2/06).

In G 2/06, the Enlarged Board considered an invention concerning, inter alia, human embryonic stem cell cultures which at the filing date could only be prepared by a method which necessarily involved the destruction of the human embryos from which they were derived, that method not being part of the claims.

When interpreting R. 28(c) EPC, the Enlarged Board also looked at Art. 6(2) Biotech Directive because the aim of introducing R. 26 to 29 EPC was to align the EPC to that directive. It observed that neither the EU legislator nor the EPC legislator, unlike their German and UK counterparts, had chosen to define the term "embryo". It assumed that they had been aware of the definitions in national laws on regulating embryos and deliberately refrained from defining the term. Given the aim of protecting human dignity and preventing the commercialisation of embryos, it could only presume that "**embryo**" was not to be construed restrictively and therefore rejected the appellant's argument that "embryo" was to be given a very specific interpretation as meaning embryos of 14 days or older, in accordance with usage in the medical field.

The appellant had argued that, for the R. 28(c) EPC prohibition to apply, the use of human embryos had to be claimed. The Enlarged Board disagreed, observing that R. 28(c) EPC did not mention claims, but rather referred to "invention" in the context of its exploitation. What had to be looked at was not just the explicit wording of the claims but the technical teaching of the application as a whole as to how the invention is to be performed. The Enlarged Board thus answered the second point referred as follows: R. 28(c) EPC forbids the patenting of claims directed to products which – as described in the application – at the filing date could be prepared exclusively by a method which necessarily involved the destruction of the human embryos from which the said products are derived, even if the said method is not part of the claims.

In T. 522/04, the contested claim was directed to a method of proliferating *in vitro* a clonal population of neural crest stem cells of mammalian origin. This clearly included cells of human origin. Since the only teaching of how to prepare human neural crest stem cell cultures was the use (involving their destruction) of human embryos, the board concluded that at the filing date human neural crest stem cells could be prepared exclusively by a method which necessarily involved the destruction of human embryos – with the inescapable result that the invention fell under the prohibition of Art. 53(a) EPC combined with R. 28(c) EPC.

In T. 2221/10 claims 1 and 2 of the appellant's sole request referred to methods of maintaining human embryonic stem cells (hES cells) in culture in an undifferentiated state, while claim 5 referred to a cell culture comprising hES cells. The appellant argued that methods using commercially or otherwise publicly available hES cell lines were not excluded from patentability because no *de novo* destruction of human embryos was necessary to perform them.

The board disagreed. It referred to G. 2/06 and noted that, according to that decision, all steps preceding the claimed use of hES cells which are a necessary precondition for carrying out the claimed invention have to be considered. In this respect the Enlarged Board of Appeal had neither made a distinction between steps which have been carried out by the inventor or by any other person, nor between steps which took place in direct preparation of the experiments leading to an invention and steps having taken place at a point in time further remote from those experiments. The board thus decided that inventions which make use of hES cells obtained by *de novo* destruction of human embryos or of publicly available hES cell lines which were initially derived by a process resulting in the destruction of the human embryos are excluded from patentability under the provisions of Art. 53(a) EPC in combination with R. 28(c) EPC. It noted that its decision was in line with ECJ judgment C-34/10.

In T. 1441/13 claim 1 of the main request was directed to a method for obtaining polypeptide-secreting cells. The method required the use of a culture of primate pluripotent stem cells (pPS) which, according to the description in the application, included human embryonic stem (hES) cells. The board considered that at the relevant date of the patent in suit, the known and practised method for achieving cultures of hES cells, i.e. the starting material of the method of claim 1, included preceding steps that involved the destruction of human embryos. Thus, the main request was not allowable under Art. 53(a) EPC and R. 28(c) EPC.

2.1.2 Scope of exception under Rule 28(d) EPC

R. 28(d) EPC (R. 23d(d) EPC 1973) provides that European patents should not be granted in respect of processes for modifying the genetic identity of animals which were likely to cause them suffering without any substantial medical benefit to man or animal, and also animals resulting from such processes.

One of the most important cases dealing with interpretation not only of R. 23d EPC 1973, but also of Art. 53(a) EPC, concerned a patent relating to **transgenic animals having an**

increased probability of developing cancer. The application resulted in two groundbreaking board decisions: T. 19/90 (OJ 1990, 476, see below), in which the matter was remitted to the department of first instance, and T. 315/03 (OJ 2006, 15), in which a patent was granted on the basis of new claims.

Having addressed the relationship between R. 23d EPC 1973 (R. 28 EPC) and Art. 53(a) EPC (see also in this chapter 1.B.2.), the board in T. 315/03 turned to the test under R. 23d(d) EPC 1973 (R. 28(d) EPC). This test required **only** three matters to be considered: animal suffering, medical benefit and the necessary correspondence between the two in terms of the animals in question. The board observed that the test was to be applied to ensure that a patent extended only to those animals whose suffering was balanced by a medical benefit. The level of proof was the same for both animal suffering and substantial medical benefit, namely likelihood (see also T. 1262/04 of 13 July 2012).

2.1.3 Test date

In T. 315/03, the board observed that the relevant date for applying the test under R. 23d EPC 1973 (R. 28 EPC) was, as for all patentability criteria, the date of filing or priority. Nevertheless, evidence becoming available later could be taken into account, provided it related to the situation on that date.

In G. 2/06, the Enlarged Board arrived at the same basic result. When assessing whether a claim contravenes R. 28(c) EPC, technical developments which became publicly available only after the filing date cannot be taken into consideration. Any other conclusion would lead to legal uncertainty, and risk being to the detriment of any third party who later provided an innocuous way to carry out the invention. The Enlarged Board thus concluded in the case before it that it is irrelevant that, after the filing date, the same products could be obtained without having recourse to a method necessarily involving the destruction of human embryos.

2.2. Article 53(a) EPC

If an invention is not excluded from patentability because it falls under one of the four categories in R. 28 EPC (see above), it must be then examined whether it is covered by the exception to patentability under Art. 53(a) EPC.

2.2.1 Test date

Assessment of an Art. 53(a) EPC objection was to be made as of the filing or priority date of the patent or application in suit. Evidence arising thereafter might be taken into account provided it was directed to the position at that date (T. 315/03).

2.2.2 Assessment of an objection according to Article 53(a) EPC

In T. 19/90 (OJ 1990, 476), the board expressed the view that in cases, like the one before it, of genetic manipulation of animals by the insertion of an activated oncogene, there were compelling reasons to consider Art. 53(a) EPC 1973. As this had not been done at the

level of the first instance, the board remitted the case to the examining division with the instruction to carry out a careful **weighing up** of the suffering of animals and possible risks to the environment on the one hand, and the invention's usefulness to mankind on the other, before deciding whether to grant or refuse the patent application (see also T 1262/04 of 13 July 2012).

a) Difference from test under Rule 28(d) EPC

In T 315/03 (OJ 2006, 15) the board held that, in animal manipulation cases, the test in T 19/90 (OJ 1990, 476) was appropriate. This differed in several respects from the test in R. 23d(d) EPC 1973 (R. 28(d) EPC), most importantly by allowing matters other than animal suffering and medical benefit to be taken into account. Whereas the R. 23d(d) EPC 1973 test only required a likelihood of animal suffering, however minor, and a likelihood of achieving a medical benefit, the test in T 19/90 required a "careful weighing up" of the matters to be balanced. This clearly allowed an appraisal of animal suffering, of environmental risks and of the feasibility of using non-animal alternatives.

A wider range of benefits to mankind than the substantial medical benefit found in R. 23d(d) EPC 1973 could also be considered. Since the test in T 19/90 was "mainly" the basis of assessment, further arguments as to the appropriate standard of morality or "ordre public" could additionally be considered, but all arguments had to be supported by evidence.

In T 315/03 the board found that claims directed to rodents failed the R. 23d(d) EPC 1973 test and had therefore to be refused, as the patent disclosed a likelihood of animal suffering but not a likelihood of medical benefit when applying the invention to this generic class of animals. The same conclusion would have been reached under an Art. 53(a) EPC 1973 assessment. However, both tests were satisfied when the invention was restricted to mice.

b) Concept of "morality" and "ordre public"

The issue of morality and "ordre public" had been raised in T 356/93 (OJ 1995, 545), in connection with plants. The object of the invention was plants and seeds resistant to a particular class of herbicides so that they could be selectively protected against weeds and fungal diseases. This was achieved by stably integrating into the genome of the plants a heterologous DNA encoding a protein capable of inactivating or neutralising the herbicides. The patent was opposed under Art. 53(a) EPC 1973, in particular on the grounds that the exploitation of the invention was likely to cause serious damage to the environment.

The board held that the concept of **morality** was related to the belief that some behaviour was right and acceptable whereas other behaviour was wrong, this belief being founded on the totality of the accepted norms which were deeply rooted in a particular culture. For the purposes of the EPC, the culture in question was the culture inherent in European society and civilisation. Accordingly, inventions the exploitation of which was not in conformity with the conventionally accepted standards of conduct pertaining to this culture were to be excluded from patentability as being contrary to morality.

The board found that none of the claims related to subject-matter which could lead to a misuse or destructive use of plant biotechnological techniques because they concerned activities (production of plants and seeds, protection of plants from weeds or fungal diseases) and products (plant cells, plants, seeds) which could not be considered to be wrong as such in the light of the conventionally accepted standards of conduct of European culture. Plant biotechnology per se could not be regarded as being more contrary to public morality than traditional selective breeding.

In T. 315/03 the board found that in the assessment of an Art. 53(a) EPC 1973 objection, no single definition of morality based on e.g. economic or religious principles represents an accepted standard in European culture. Opinion poll evidence was of very limited value for the reasons given in T. 356/93 (OJ 1995, 545), where many drawbacks were identified, ranging from the type and the number of questions posed within one poll, through the size and representative nature of the cross-section of the population polled, to the manner of interpretation of the results obtained.

In T. 356/93 the board defined the concept of "**ordre public**" as covering the protection of public security and the physical integrity of individuals as part of society. It also encompassed the protection of the environment. Accordingly, inventions the exploitation of which was likely to seriously prejudice the environment were to be excluded from patentability as being contrary to "ordre public". However, a decision in this respect presupposes that the threat to the environment be sufficiently substantiated at the time the decision is taken by the EPO.

In the specific case the board held that, although the documents submitted by the appellant (opponent) provided evidence of possible hazards from the application of genetic engineering techniques to plants, they did not lead to the definite conclusion that the exploitation of any of the claimed subject-matter would seriously prejudice the environment.

Regarding the compatibility with Art. 53(a) EPC 1973 of an invention involving genetically modified, herbicide-resistant plants, see also T. 475/01.

c) Donor consent

The invention in T. 1213/05 related to the human BRCA1 gene isolated from the genome, mutant forms of that gene and its use in the diagnosis of predisposition to breast and ovarian cancer. Appellant II submitted that the lack of proof that the donors of the cells had given previous informed consent to the commercial exploitation of the research results by patents as well as a benefit sharing agreement meant that the initial obtaining of these research results involved a violation of ordre public or morality as referred to in Art. 53(a) EPC.

The board disagreed. The EPC contained no provision establishing a requirement for applicants to submit evidence of previous informed consent of the donor of the cells or a benefit sharing agreement. That the legislator had not provided for a procedure of verifying

such informed consent could also be deduced from the Biotech Directive, which had to be used as supplementary means of interpretation (R. 23b(1) EPC 1973, R. 26(1) EPC).

In addition, the board referred to ECJ judgment C-377/98 concerning the application for annulment of the Directive, where the Court had rejected the plea of the Kingdom of the Netherlands that the absence of a provision requiring verification of the consent of the donor or recipient of products obtained by biotechnological means undermined the right to self-determination. The Directive concerned only the grant of patents and therefore did not extend to activities before and after grant, whether they involved research or the use of the patented products.

3. Patentability of biological inventions

3.1. Plants and plant varieties

According to Art. 53(b) EPC, a patent shall not be granted if the claimed subject-matter is directed to plant varieties. If a product claim does not specify any particular plant variety, but a **technical teaching which can be embodied in an unspecified number of plant varieties**, the subject-matter of the claimed invention does not relate to a plant variety or varieties within the meaning of Art. 53(b) EPC. Thus, a patent will not be granted for a single plant variety but can be granted if varieties may fall within the scope of the claims. If plant varieties are individually claimed, they are not patentable, irrespective of how they were made (G 1/98, OJ 2000, 111).

3.1.1 Definition of the term "plant varieties"

T 49/83 (OJ 1984, 112) first defined the term "plant varieties" as a multiplicity of plants which were largely the same in their characteristics and remained the same within specific tolerances after every propagation cycle. Following on from this, the board in T 320/87 (OJ 1990, 71) concluded that **hybrid seed and plants**, lacking stability in some trait of the whole generation population, could not be classified as plant varieties within the meaning of Art. 53(b) EPC 1973. In this regard, see also T 788/07. In T 356/93 (OJ 1995, 545) the board held that **plant cells** as such, which with modern technology can be cultured much like bacteria and yeasts, could not be considered to fall under the definition of a plant or of a plant variety. This was confirmed by G 1/98, which stated that plant cells should be treated like micro-organisms.

The term 'plant variety' is defined in R. 26(4) EPC in the same way as in Directive 98/44/EC on the legal protection of biotechnological inventions, namely as "any plant grouping within a single botanical taxon of the lowest known rank, which grouping, irrespective of whether the conditions for the grant of a plant variety are fully met, can be:

(a) defined by the expression of the characteristics that results from a given genotype or combination of genotypes,

(b) distinguished from any other plant grouping by the expression of at least one of the said characteristics, and

(c) considered as a unit with regard to its suitability for being propagated unchanged."

The words "the expression of the characteristics that results from a given genotype or combination of genotypes" used in R. 26(4)(a) EPC refer to the entire constitution of a plant or a set of genetic information. In contrast, a plant defined by single recombinant DNA sequences is not an individual plant grouping to which an entire constitution can be attributed within the above meaning. A plant defined in this way is not a concrete living being or grouping of concrete living beings but an abstract and open definition embracing an indefinite number of individual entities defined by a part of its genotype or by a property bestowed on it by that part (G 1/98, T 189/09, T 547/10).

In T 1208/12 the board held that a claim for a hybrid plant seed produced by a cross of two types of Brassica plants, was directed to an excluded plant variety. The board held that the technical situation underlying the present case was different from that in G 1/98 and that the claims were not for a seed or plant merely defined by the presence of a single recombinant DNA sequence. The definition of the claimed subject-matter thus did not fit the concept set out in G 1/98 of "an abstract and open definition embracing an indefinite number of individual entities defined by a part of its genotype or by a property bestowed on it by that part". In the case at hand, the subject-matter defined a seed or a plant which necessarily belongs to a particular plant grouping which complies with the definition of plant variety pursuant to R. 26(4) EPC, i.e. it relates exclusively to individual plant groupings to which an entire constitution can be attributed.

3.1.2 Limits to patentability

In G 1/98, the Enlarged Board concluded that, where specific plant varieties were not claimed individually, the claim was not excluded from patentability under Art. 53(b) EPC, even if it might potentially embrace plant varieties. The Enlarged Board took the view that Art. 53(b) EPC 1973 defined the borderline between patent protection and plant variety protection. The extent of the exclusion for patents was the obverse of the availability of plant variety rights. Since plant variety rights were only granted for specific plant varieties and not for technical teachings which could be implemented in an indefinite number of plant varieties, it was not sufficient for the exclusion from patent protection in Art. 53(b) EPC 1973 to apply that one or more plant varieties were embraced or might be embraced by the claims of the patent application (see also T 475/01).

The Enlarged Board further held that Art. 64(2) EPC 1973 should not be taken into consideration when a claim to a process for the production of a plant variety was examined, in conformity with the established case law according to which the protection conferred by a process patent is extended to the **products obtained directly by the process**, even if the products are not patentable per se (see chapter II.A.7.1.).

Finally, the Enlarged Board held that the exception to patentability in Art. 53(b), first part of sentence, EPC 1973, applied to plant varieties irrespective of the way in which they were produced. Therefore, plant varieties containing genes introduced into an ancestral plant by recombinant gene technology were excluded from patentability. The underlying reason for this was that the exclusion in Art. 53(b) EPC 1973 was designed to exclude

from patentability subject-matter which was eligible for protection under the plant breeders' rights system. It did not make any difference for the requirements under the UPOV Convention or under the Regulation on Plant Variety Rights, whether a variety was obtained by traditional breeding techniques or genetic engineering. The argument that the EPC legislator had not envisaged the possibility of **genetically modified plant varieties** and therefore could not have intended to exclude them from patentability could not be accepted – laws were not restricted in their application to situations known to the legislator.

3.2. Animals and animal varieties

In T 19/90 (OJ 1990, 476) the board confirmed the general principle that the exception to patentability under Art. 53(b) EPC 1973 applies to certain categories of animals, but **not to animals as such**. In interpreting the term "animal varieties" the board emphasised the narrow interpretation to be given to the provisions of Art. 53(b) EPC 1973. It is not a bar to patentability for subject-matter which is not covered by any of the terms "animal varieties", "races animales" or "Tierarten".

Concerning the patentability of animals, it was held in T 315/03 (OJ 2006, 15) that, in an assessment under Art. 53(b) EPC 1973, the principle enunciated in G 1/98 (OJ 2000, 111) concerning plants and "plant varieties" should also be followed in the case of animals. This meant that a patent could not be granted for a single animal variety (or species or race, depending on which language text of the EPC 1973 was used) but could be granted if varieties might fall within the scope of its claims.

The bar on patenting under Art. 53(b), first part of sentence, EPC 1973 did not extend to the products of a micro-biological process, which were patentable under Art. 53(b), second part of sentence, EPC 1973. Thus patents were held to be grantable for **animals produced by a microbiological process**. However, particularly in cases of genetic manipulation of animals involving, as in the case at issue, the insertion of an activated oncogene, there are compelling reasons to consider the provisions of Art. 53(a) EPC when assessing patentability (T 19/90).

In T 315/03 the board did not agree with the assertion of some of the opponent appellants that the claimed transgenic mice were a new species because they inherited one particular characteristic, namely an increased probability of developing tumours. This was not enough to create a new species when the possible "starting material" might be any of a whole genus of animals, namely all mice. The board held that Art. 53(b) EPC 1973 did not exclude the patentability of the claims amended to encompass only mice and maintained the patent on that basis.

3.3. Essentially biological processes

Processes for the production of plants or animals are not patentable (under either the old or the revised version of the EPC) if they are essentially biological processes. Processes which are not essentially biological, on the other hand, are patentable.

3.3.1 Essentially biological processes for the production of animals

In T. 19/90 (OJ 1990, 476) the board agreed that the process claims for the production of transgenic non-human mammals through chromosomal incorporation of an activated oncogene sequence into the genome of the non-human mammal did not involve an "essentially biological process". The product claim for the genetically-manipulated animal included descendants not directly genetically manipulated themselves but produced by the essentially biological process of sexual reproduction. The board held that this was a product claim defined in terms of the process by which it was produced and that a product-by-process claim remained a product claim irrespective of the process it referred to.

In T. 315/03 (OJ 2006, 15) the board held that the claimed process for producing transgenic mice, which included genetic manipulation, was not "an essentially biological process", the latter being defined in R. 23b(5) EPC 1973 (R. 26(5) EPC) as consisting "entirely of natural phenomena such as crossing or selection".

In T. 1199/08 appellant II argued that if the technical teaching of the patent as a whole was taken into account, it became obvious that the only purpose of the claimed method was the production of an animal. The board rejected the argument that the "whole contents approach" developed in G. 2/06 should be taken into consideration for a correct assessment of whether the claim in question would fall under the prohibition of Art. 53(b) EPC. It also decided that a claim to a method which allowed for the long-term preservation of sex-selected sperm did not qualify as an essentially biological process for the production of animals. Therefore, in line with the parallel reasoning developed in G. 2/07 regarding processes for the production of plants (see below), it did not fall under the prohibition of Art. 53(b) EPC.

3.3.2 Essentially biological processes for the production of plants

a) G. 2/07 and G. 1/08

The leading cases concerning the interpretation of the exclusion from patentability of essentially biological processes for the production of plants are the consolidated cases G. 2/07 (OJ 2012, 130) and G. 1/08 (OJ 2012, 206) ruling on the referral in T. 83/05 of 22 May 2007 (OJ 2007, 644) relating to a method of obtaining particular broccoli lines and on that in T. 1242/06 of 4 April 2008 (OJ 2008, 523) relating to a method of breeding tomato plants which produce tomatoes with reduced fruit water content.

The Enlarged Board of Appeal found, first of all, that the exception applying to "essentially biological processes for the production of plants" could not be read as limited to processes for the production of plant varieties, because such an interpretation would be contrary to the wording.

After rejecting a series of possible approaches to the interpretation of the exclusion, the Enlarged Board concluded that a non-microbiological process for the production of plants which contains or consists of the steps of sexually crossing the whole genomes and of subsequently selecting plants is "essentially biological" within the meaning of

Art. 53(b) EPC. Such a process does not escape the exception to patentability merely because it contains, as a further step or as part of any of the steps of crossing and selection, a step of a technical nature which serves to enable or assist performance of the steps of sexually crossing the whole genomes of plants or of subsequently selecting plants.

This outcome was largely based on the Enlarged Board's findings with regard to the legislative history of the Strasbourg Patent Convention and the EPC 1973. The legislator's intention, it found, had been to exclude from patentability those plant breeding processes which were the conventional methods of plant-variety breeding at the time. These conventional methods included, in particular, those based on the sexual crossing of plants (i.e. of their whole genomes) deemed suitable for the purpose pursued and on the subsequent selection of the plants having the desired trait(s). It could also be gathered from the legislative history that the mere use of a technical device in a breeding process was not to be considered sufficient to lend the process itself a technical character.

The Enlarged Board distinguished such processes from those which left the realm of plant breeding. It cited R. 27(c) EPC, which expressly provides that biotechnological inventions are also patentable if they concern a microbiological or other technical process, so that the excluded essentially biological processes are juxtaposed with the patentable technical processes. The exception to patentability under Art. 53(b) EPC does not exclude a process of sexual crossing and selection which includes within it an additional step of a technical nature, which step by itself introduces a trait into the genome or modifies a trait in the genome of the plant produced, so that the introduction or modification of that trait is not the result of the mixing of the genes of the plants chosen for sexual crossing. In the context of examining whether such a process is excluded from patentability as being "essentially biological" within the meaning of Art. 53(b) EPC, it is not relevant whether a step of a technical nature is a new or known measure, whether it is trivial or a fundamental alteration of a known process, whether it does or could occur in nature or whether the essence of the invention lies in it.

Ultimately, this means that, while the presence in a claim of one feature which could be characterised as biological does not necessarily result in exclusion of the claimed process as a whole under Art. 53(b) EPC, the same does not apply where the process includes sexual crossing and selection.

In T 2323/11 the invention concerned the removal of unwanted sequences from the genome of transgenic plants which comprise an introduced gene for an agronomically valuable trait. In G 2/07 and G 1/08 the Enlarged Board considered that, under Art. 53(b) EPC, excluded processes were characterised by the fact that the traits of the plants resulting from the crossing were determined by the underlying natural phenomenon of meiosis. The board held – contrary to the appellant's argument – that the trait of the excision of the target gene is the result of the crossing of the parent plants and is determined by the underlying natural phenomenon of meiosis, as the latter determines the genetic make-up of the plants produced. The claimed method therefore did not fall under the exception made in G 2/07 and G 1/08 for those processes which contain an additional step of technical nature.

In T. 915/10 the invention concerned soybean plants which had been genetically modified. The claimed method was defined solely by the technical process step of introducing a gene sequence into the genome of the plant by a genetic engineering step introducing heterologous DNA in plant cells. The board noted that the introduced trait was due directly to the expression of the inserted DNA and was not the result of a plant breeding method characterised by crossing and selection. Indeed, the method as claimed did not require nor define steps of mixing genes of plants by sexual crossing and subsequent selection of plants, either explicitly or implicitly. The board was thus satisfied that the claimed method did not fall under the exclusion of "essentially biological processes for the production of plants" pursuant to Art. 53(b) EPC. The board considered that the claimed subject-matter was a method for the production of plants by means of genetic-engineering techniques, which involves laboratory techniques essentially different from breeding methods and which as such have been accepted in the case law to be patentable. The board noted that there was nothing in decisions G. 2/07 and G. 1/08 which would indicate that the Enlarged Board of Appeal was of the opinion that this practice ought to be reconsidered as a result of its analysis of the process exclusion in Art. 53(b) EPC.

b) Patentable technical processes

In T. 1729/06 the invention was in the field of the production of watermelon fruit, in particular of seedless watermelons. The claimed use and methods concerned the pollination of the sterile female flowers of the triploid watermelon plant with pollen of the diploid polliniser plant. They did not concern sexually crossing two whole genomes of plants (implying meiosis and fertilisation) and the subsequent selection of plants. The board was therefore satisfied that the use and methods as subject-matter of the claims were not such methods which the Enlarged Board of Appeal in its decisions G. 2/07 (OJ 2012, 130) and G. 1/08 (OJ 2012, 206) had considered to fall under the exclusion of "essentially biological processes for the production of plants".

The board noted that, in those decisions, the Enlarged Board had not given a comprehensive and exhaustive definition of the subject-matter to which the process exclusion in Art. 53(b) EPC applies in relation to plant inventions. Therefore, it still needed to be established whether the claimed uses and methods were excluded from patentability by virtue of the process exclusion in Art. 53(b) EPC for other reasons.

The board found that they were not. The legislator drafting Art. 53(b) EPC had not intended to exclude from patentability a whole class of inventions, i.e. horticultural or agricultural (agronomic) processes, under which the claimed use and methods undoubtedly fell. The EPC 1973 legislator (and the EPC 2000 legislator) had only wished to exclude from patentability the – then conventional – processes applied by plant breeders in connection with new plant varieties for which a special property right was available under the UPOV Convention, and processes which were fundamentally of this type.

Thus, rather than being excluded from patentability by virtue of Art. 53(b) EPC, the claimed uses and methods constituted a "technical process" and were therefore patentable pursuant to R. 27(c) EPC.

3.3.3 Product claims for plants or plant material

In the consolidated cases G 2/12 and G 2/13 (OJ 2016, A28 and A29) the Enlarged Board was concerned with the question whether the exclusion of essentially biological processes for the production of plants in Art. 53(b) EPC had a negative effect on the allowability of product claims or product-by-process claims directed to plants or plant material (such as a fruit or plant parts) which are directly obtained and/or defined by an essentially biological process. It concluded that it did not.

The Enlarged Board applied the various methodical lines of interpretation set out in Art. 31 and 32 of the Vienna Convention on the Law of Treaties. None of these led the Enlarged Board to conclude that the term "essentially biological processes for the production of plants" extended beyond the processes to products defined or obtained by such processes. This result was confirmed when the preparatory work of the EPC was taken into account as a supplementary means of interpretation.

The Enlarged Board also examined whether considerations had arisen since the Convention was signed which might give reason to believe that a literal interpretation of the relevant provision would conflict with the legislator's aim. However, it could not see why the original intention of the legislator in drafting Art. 53(b) EPC was no longer justified, just because new plant breeding techniques were available today.

The Enlarged Board considered whether allowing patenting of a product claim or a product-by-process claim for a plant or plant material that is obtained by a means of an essentially biological process could be regarded as a circumvention of the process exclusion. It found that it could not, referring to the clear wording of Art. 53(b) EPC. It warned that broadening the scope of the process exclusion to the extent that it included products obtained by essentially biological processes for the production of plants would introduce an inconsistency in the system of the EPC, as plants and plant material other than plant varieties were generally eligible for patent protection.

On the question whether it was of relevance that the protection conferred by the product claim encompassed the generation of the claimed product by means of an essentially biological process for the production of plants excluded as such under Art. 53(b) EPC, the Enlarged Board highlighted the distinction between the requirements for patentability and the extent of protection. Whether a product claim or a product-by-process claim was patentable was to be examined irrespective of the extent of protection that is conferred by it after grant.

The Enlarged Board emphasised that its judicial decision-making powers did not extend to the ethical, social and economic aspects raised in the general debate, as it had no mandate to engage in legislative policy.

The questions of law referred to the Enlarged Board of Appeal were answered as follows:

1. The exclusion of essentially biological processes for the production of plants in Art. 53(b) EPC does not have a negative effect on the allowability of a product claim directed to plants or plant material such as a fruit (G 2/12) or plant parts (G 2/13).
2. The fact that the process features of a product-by-process claim directed to plants or plant material other than a plant variety define an essentially biological process for the production of plants does not render the claim unallowable (G 2/13). The fact that the only method available at the filing date for generating the claimed subject-matter is an essentially biological process for the production of plants disclosed in the patent application does not render a claim directed to plants or plant material other than a plant variety unallowable (G 2/12, G 2/13).
3. In the circumstances, it is of no relevance that the protection conferred by the product claim encompasses the generation of the claimed product by means of an essentially biological process for the production of plants excluded as such under Art. 53(b) EPC (G 2/12, G 2/13).

In its decision T 83/05 of 10 September 2015 the board applied G 2/13. Claim 1 of the main request was directed to an edible Brassica plant produced according to a method of crossing and selecting. Claims 2 and 3 were directed to an edible portion and to the seed of a broccoli plant produced by a method defined in the same manner as in claim 1. Claims 4 and 5 were directed to a broccoli plant and a broccoli inflorescence. The board remitted the case to the department of first instance with an order to maintain the patent on the basis of claims 1 to 5 of the main request.

In T 1242/06 of 8 December 2015 the board applied G 2/12. The newly submitted claims were restricted to claims for products and related to a (naturally) dehydrated tomato fruit of the species *L. esculentum*. The board held that the subject-matter in question was not excluded from patentability pursuant to Art. 53(b) EPC. The board remitted the case to the opposition division with the order to maintain the patent on the basis of these claims.

Following a Notice of the European Commission, clarifying that Directive 98/44/EC of the European Parliament and of the Council of 6 July 1998 on the legal protection of biotechnological inventions intended to exclude products 'exclusively obtained by means of an essentially biological process', the Administrative Council amended R. 27 EPC and R. 28 EPC in 2017 (OJ 2017, A56) to exclude from patentability plants exclusively obtained by means of an essentially biological process.

In T 1063/18, the board, in an enlarged composition consisting of three technically and two legally qualified members, held that R. 28(2) EPC (see OJ 2017, A56) is in conflict with Art. 53(b) EPC as interpreted by the Enlarged Board of Appeal in decisions G 2/12 and G 2/13. The board referred to Art. 164(2) EPC, according to which the provisions of the Convention prevail in case of conflict with the Implementing Regulations, and decided to set the decision under appeal aside and to remit the case to the examining division for further prosecution.

The board did not see any reason to deviate from G 2/12 and G 2/13. The interpretation of the Biotech Directive as put forward in the Notice of the European Commission on certain articles of Directive 98/44/EC was not seen as a relevant development because it had not been confirmed in a legally binding way. Considering whether an interpretation of Art. 53(b) EPC, different from that given in decisions G 2/12 and G 2/13, was necessary in view of Art. 31(3)(a) of the Vienna Convention on the Law of Treaties, the board concluded that neither the decision of the Administrative Council to adopt R. 28(2) EPC nor the Notice of the European Commission could be regarded as a subsequent agreement between the parties in the sense of the Vienna Convention.

On 4 April 2019 the President of the European Patent Office referred to the Enlarged Board of Appeal points of law on the interpretation of Art. 164(2) EPC and the assessment of R. 28(2) EPC under said provision. Under Art. 112(1)b) EPC the following questions were referred to the Enlarged Board of Appeal:

1. Having regard to Art. 164(2) EPC, can the meaning and scope of Art. 53 EPC be clarified in the Implementing Regulations to the EPC without this clarification being a priori limited by the interpretation of said Article given in an earlier decision of the Boards of Appeal or the Enlarged Board of Appeal?
2. If the answer to question 1 is yes, is the exclusion from patentability of plants and animals exclusively obtained by means of an essentially biological process pursuant to R. 28(2) EPC in conformity with Art. 53(b) EPC which neither explicitly excludes nor explicitly allows said subject-matter?

This referral is now pending as **G 3/19**.

3.4. Microbiological processes and the products thereof

The exception to patentability for plant or animal varieties or essentially biological processes for the production of plants or animals does not apply to microbiological processes or the products thereof (Art. 53(b), second part of sentence, EPC).

3.4.1 The concept of "microbiological processes"

R. 26(6) EPC defines a "microbiological process" as any process involving or performed upon or resulting in microbiological material. The boards have not yet issued a decision interpreting this definition.

According to T 356/93 (OJ 1995, 545), the concept of "microbiological processes" under Art. 53(b), second part of sentence, EPC refers to processes in which micro-organisms (or their parts) are used to make or to modify products or in which new micro-organisms are developed for specific uses. Consequently, the concept of "products thereof" under Art. 53(b), second part of sentence, EPC encompasses products which are made or modified by micro-organisms as well as new micro-organisms as such. The board defined the term "micro-organism" as including not only bacteria and yeasts, but also fungi, algae, protozoa and human, animal and plant cells, i.e. all generally unicellular organisms with

dimensions not visible to the naked eye which can be propagated and manipulated in a laboratory, including plasmids and viruses.

Examining the patentability of the claimed plant grouping, the board in **T 356/93** also addressed the issue whether **multi-step processes** for producing plants which include at least one **microbiological process step** could be considered as a whole to represent "microbiological processes", and whether, consequently, the products of such processes (e.g. plants) might be regarded as being "the products thereof" for the purposes of this provision. The board held that "technical processes including a microbiological step" could not simply be equated with "microbiological processes". Nor could the resulting final products of such a process (e.g. plant varieties) be defined as "products of a microbiological process" within the meaning of the said provision.

3.4.2 Difference between microbiological and genetic-engineering processes

In **G 1/98** (OJ 2000, 111), the Enlarged Board suggested that processes of genetic engineering and microbiological processes are not identical. The term microbiological processes in **Art. 53(b) EPC 1973** was used as a synonym of processes using micro-organisms. Micro-organisms are different from the parts of living beings used for the genetic modification of plants. To treat genetically-modified plants as products of microbiological processes within the meaning of **Art. 53(b)**, second part of sentence, EPC 1973, would disregard the purpose of the exclusion of plant varieties in **Art. 53(b) EPC 1973**, i.e. excluding from patentability subject-matter eligible for protection under the plant breeders' rights system. Therefore, the Enlarged Board took the view that it did not make any difference for the requirements under the UPOV Convention or under the Regulation on Plant Variety Rights, how a variety was obtained. Whether a plant variety was the result of traditional breeding techniques, or whether genetic engineering was used to obtain a distinct plant grouping, did not matter. This meant that the term "plant variety" was appropriate for defining the borderline between patent protection and plant breeders' rights protection irrespective of the origin of the variety.

4. Medical methods

4.1. Introduction

Art. 53(c) EPC states that European patents shall not be granted in respect of methods for treatment of the human or animal body by surgery or therapy and diagnostic methods practised on the human or animal body; this provision shall not apply to products, in particular substances or compositions, for use in any of these methods. Thus, the exclusion of methods of treatment and diagnostic methods formerly referred to in **Art. 52(4) EPC 1973** has been added to the two exceptions to patentability and reappears in the new **Art. 53(c) EPC**.

In three (almost) identical decisions **G 1/83**, **G 5/83** and **G 6/83** (OJ 1985, 60,64, 67), the Enlarged Board stated that the intention of **Art. 52(4) EPC 1973** (now **Art. 53(c) EPC**) was only to prevent non-commercial and non-industrial medical and veterinary activities from being restrained by patent rights (see also **T 245/87**, OJ 1989, 171). In **G 1/04** (OJ 2006,

334) the Enlarged Board of Appeal stated, with reference to diagnostic methods, that their exclusion from patentability seemed actually to be based on socio-ethical and public health considerations. In G 1/07 (OJ 2011, 134), a decision concerning treatment by surgery, the Enlarged Board noted that the exclusion under Art. 52(4) EPC 1973 (Art. 53(c) EPC) had been deliberately maintained by the legislator, thereby confirming the principle that medical and veterinary practitioners' freedom to use the best available treatments to the benefit of their patients, uninhibited by any worry that some treatment might be covered by a patent, should be protected by excluding these activities from patentability.

4.2. Methods for treatment by surgery or therapy and diagnostic methods

4.2.1 Distinction in the approach

In the case law of the boards of appeal a distinction is made in the approach to methods for treatment by surgery or therapy on the one hand and diagnostic methods on the other. The leading cases are G 1/04 (OJ 2006, 334) concerning diagnostic methods, and G 1/07 (OJ 2011, 134) concerning treatment by surgery.

An important difference between the two approaches is that, whilst a method claim falls under the prohibition on patenting methods for treatment by therapy or surgery if it comprises or encompasses at least **one** feature defining a physical activity or action that constitutes a method step for treatment of a human or animal body by surgery or therapy (G 1/07), a much narrower interpretation of Art. 52(4) EPC 1973 was applied with regard to the exclusion from patentability of diagnostic methods in G 1/04 (see in this chapter I.B.4.5. "Diagnostic methods" – G 1/04).

4.2.2 Uniform approach: no need for practitioner involvement

In G 1/04 (OJ 2006, 334), concerning diagnostic methods, the Enlarged Board held that whether or not a method is a diagnostic method may neither depend on the participation of a medical or veterinary practitioner nor on the fact that all method steps can also, or only, be practised by medical or technical support staff, the patient himself or herself, or an automated system. The Enlarged Board highlighted the difficulty, if not impossibility, of defining the persons that were considered to be such practitioners on a European level within the framework of the EPC. For reasons of legal certainty, the European patent grant procedure should not be rendered dependent on the involvement of such practitioners (see also in this chapter I.B.4.5.1.b).

Referring to G 1/04, the Enlarged Board of Appeal in G 1/07 (a decision concerning treatment by surgery) confirmed that whether or not a method is excluded from patentability under Art. 53(c) EPC cannot depend on the person carrying it out. The Enlarged Board in G 1/07 found that, although the findings in G 1/04 related to diagnostic methods, they dealt quite generally with the exclusion from patentability under Art. 52(4) EPC 1973 and were thus equally valid with respect to the other exclusion conditions contained in the new Art. 53(c) EPC.

4.3. Surgical methods

G 1/07 (OJ 2011, 134) marked an important turning point in the boards' case law on the exclusion of surgical methods from patentability. Whilst the Enlarged Board endorsed the existing basic approach to multi-step methods (see in this chapter **J.B.4.3.1**), it rejected the practice followed by the EPO thus far of broadly construing interventions of a surgical nature. It did not redefine the term "treatment by surgery", but indicated the direction in which it expected future practice and case law to develop. According to **G 1/07**, the required new direction is that the exclusion from patentability should not be applied to methods in respect of which the interests of public health, of protection of patients and as a counterpart to that of the freedom of the medical profession to apply the treatment of choice to their patients does not call for their exclusion from patentability (see in this chapter **J.B.4.3.3**).

4.3.1 One surgical step in a multi-step method

In **G 1/07** the Enlarged Board upheld the principle confirmed in opinion **G 1/04** (OJ 2006, 334) and underlying the whole body of practice and jurisprudence hitherto (see e.g. **T 820/92** (OJ 1995, 113)), that a method claim falls under the prohibition on patenting methods for treatment by therapy or surgery now under **Art. 53(c) EPC** if it comprises or encompasses **at least one** feature defining a physical activity or action that constitutes a method step for treatment of a human or animal body by surgery or therapy. The principle is not only formally justified by the fact that the exclusion under **Art. 53(c) EPC** does not contain any limitation as to the defined methods being excluded only when claimed as such. More importantly, it is also justified as to substance, i.e. it enables the legislative purpose served by the exclusion to be achieved (see in this chapter **J.B.4.1**).

4.3.2 Treatment by surgery not limited to surgery for a therapeutic purpose

In **G 1/07** (OJ 2011, 134) the Enlarged Board of Appeal concluded that neither the legal history nor the object and purpose of the exclusions from patentability in **Art. 53(c) EPC** would justify a limitation of the term "treatment by surgery" to curative surgery (overruling **T 383/03**). Such a limitation would be contrary to the ordinary understanding of the word "surgery" as referring to the nature of the treatment rather than its purpose, and contrary to the fact that **Art. 53(c) EPC** defines three separate alternative exclusions thereby suggesting that these are not merely identical in scope. The Enlarged Board of Appeal observed in **G 1/07** that the comparison between **T 383/03** and **T 1172/03** showed how inconsistent the decisions to be made could become if the term "treatment by surgery" was seen as limited to therapeutic surgery only.

4.3.3 Towards a new concept of "treatment by surgery"

The Enlarged Board disapproved of the broad construction of interventions of a surgical nature corresponding to the practice of the EPO, such as in decisions **T 182/90** and **T 35/99**, namely that all methods involving irreversible damage to or destruction of living cells or tissues of the living body were regarded as non-insignificant interventions and thus as surgical treatments, irrespective of the underlying mechanism of the intervention (e.g.

mechanical, electrical, thermal, chemical). This view was overly broad when considering today's technical reality. Thus the definition given obiter dicta in G. 1/04 that ""any physical intervention" on the human or animal body..." is a method of surgery within the meaning of Art. 52(4) EPC 1973 appeared too broad.

A narrower understanding of "treatment by surgery" was required. Any definition of the term "treatment by surgery" must cover the kind of interventions which represent the core of the medical profession's activities, i.e. the kind of interventions for which their members are specifically trained and for which they assume particular responsibility. Such a narrower understanding rules out uncritical methods involving only a minor invention and no substantial health risks.

The Enlarged Board found itself unable to give a definition which would delimit the exact boundaries of a new concept of treatment by surgery. The field of methods which potentially involves surgical steps is vast, so that each category of class will have to be assessed on its own merits.

However, the Enlarged Board indicated the direction it expected future practice and case law to take, finding that the exclusion from patentability should not be applied to methods in respect of which the interests of public health, of protection of patients and as a counterpart to that of the freedom of the medical profession to apply the treatment of choice to their patients does not call for their exclusion from patentability. It is for the departments of first instance and the boards to define the boundaries of a more narrowly construed concept of "treatment by surgery", based on the technical reality of the individual case under consideration.

The required medical expertise and the health risk involved may not be the only criteria which may be used to determine that a claimed method actually is a "treatment by surgery" within the meaning of Art. 53(c) EPC. It appears that what is to be understood by "surgery" in the medical sense is to a large extent a matter of convention. Thus, in order to be surgical, it is not necessary that the intervention be invasive or that tissues be penetrated (T. 5/04). The scope of what is surgery may change with time and with new technical developments emerging, as was already acknowledged in decision T. 182/90.

With regard to the facts of the case the Enlarged Board decided in G. 1/07 that a claimed imaging method, in which, when carried out, maintaining the life and health of the subject is important and which comprises or encompasses an invasive step representing a substantial physical intervention on the body which requires professional medical expertise to be carried out and which entails a substantial health risk even when carried out with the required professional care and expertise, is excluded from patentability as a method for treatment of the human or animal body by surgery pursuant to Art. 53(c) EPC.

4.3.4 "Treatment by surgery" in the case law since G 1/07

a) Surgical nature of a method step

In T 992/03 of 4 November 2010, ^{129}Xe gas was used as part of the claimed method. The board observed that it was known that ^{129}Xe could also be used as an anaesthetic, but found that this was irrelevant in assessing whether the claimed methods should be excluded from patentability under Art. 53(c) EPC. The Enlarged Board had clarified in G 1/07 that "there is an exclusion from patentability as a surgical method only if the health risk is associated with the mode of administration and not solely with the agent as such" and any anaesthetic effect of the ^{129}Xe gas thus did not fall under the exclusion.

The question to be decided in T 663/02 was whether the step of "injecting the magnetic resonance contrast agent into a vein remote from the artery" had a surgical character. Citing G 1/07, the board concluded that the fact that an intravenous injection of a magnetic resonance contrast agent could be delegated by a physician to a qualified paramedical professional indicated that such an injection may be considered as representing a minor routine intervention which did not imply a substantial health risk when carried out with the required care and skill. Such acts would be ruled out from the scope of the application of the exclusion clause pursuant to Art. 53(c) EPC following the narrow understanding advocated by the Enlarged Board of Appeal (G 1/04 and G 1/07). A possible way of assessing health risks is to use a risk matrix permitting the levels of likelihood and health impact of a complication of a medical act with regard to a large number of patients to be combined, so as to obtain statistical health risk scores which may be used to decide what action should be taken.

In T 1075/06 the board held that venipuncture of blood donors and the extraction of blood from a donor's body represent substantial physical interventions on the body which require professional medical expertise to be carried out and which entail a substantial health risk even when carried out with the required professional care and expertise. A method claim comprising steps encompassing such procedures is a method for treatment of the human body by surgery. Similarly, in T 1695/07 the board held that a blood manipulation process involving the continuous removal of blood from a patient, its subsequent flowing through a circulating line of an extracorporeal circuit and its re-delivery to the patient was a method of treatment of the human body by surgery.

b) Surgical step part of claimed method?

In a series of decisions, the boards have considered whether particular surgical steps form part of the claimed method or are simply preparatory measures which cannot be deemed such a part. They have arrived at different conclusions.

In T 992/03 of 4 November 2010, methods were claimed for MR imaging the pulmonary and/or cardiac vasculature of a subject, using dissolved-phase polarised ^{129}Xe gas. The board stated that whilst a skilled person would know that a MR imaging method was a rather complex procedure requiring inter alia preparatory steps like positioning of a subject in the MR system, delivering polarised ^{129}Xe gas to the subject and initialising the MR

system, these preparatory steps did not form part of the contribution of the invention to the art. The method claims thus did not comprise "an invasive step representing a substantial physical intervention on the body which requires professional medical expertise to be carried out and which entails a substantial health risk even when carried out with the required professional care" (G 1/07).

In T 836/08, claim 1 concerned a method for tracking the position of the distal end of a bone guide wire, using a medical optical tracking and navigation system. The board found that, while this meant that the reference apparatus had to be attached to, and the wire introduced into, the bone, these steps were not part of the claimed method. The fact that the method was performed after, or even during, a surgical intervention on the body did not mean that the claimed position-tracking method as such was a method of treatment by surgery.

Although the decision in T 923/08 was concerned with circumstances similar to those in T 836/08, the board came to a very different result: where a method for determining measurements of the human or animal body necessarily entailed a surgical step consisting of fixing to the human or animal body a measuring device indispensable for performance of the method, that step had to be deemed an essential feature of the method which was covered by such a method, even if none of the claimed method features expressly related to this step. Such a method was excluded from patentability under Art. 53(c) EPC. Moreover, such a surgical step could not be removed from the scope of the claimed method by means of wording stating that the surgically placed measuring device was already fixed to the body before the start of the method, or by means of a disclaimer, as this would breach Art. 84 EPC (1973) (see also T 2102/12).

In T 2438/11 the claim was directed to a method for instrument alignment comprising steps whereby a surgical drill or mill was aligned with a target point. Said alignment was to take place in the patient's body, in direct physical contact with the bone. The board held that the very act of alignment, i.e. actively moving an instrument of this kind within the patient's body, was a substantial physical intervention on the body and thus a method step for treatment of the human body by surgery. According to G 1/07, a method claim falls under the exclusion from patentability if it comprises or encompasses at least one feature defining a physical activity or action that constitutes a method step for the treatment of the human or animal body by surgery or therapy.

c) Apparatus claim – disguised method claim?

In T 1798/08, although all claims were directed to a visual prosthesis, i.e. an apparatus, they were objected to by the opponent under Art. 53(c) EPC as relating to a surgical method. The features "suitable to be located on the body of the user outside a wall of the sclera and attached to the sclera" and "suitable to be located implanted in the eye behind the iris", the opponent argued, related to a method for treatment of the human or animal body by surgery and thus transformed the claim into a "disguised" method claim, even though it was notionally directed to a device.

The board dismissed this objection. It observed that Art. 53(c), second sentence, EPC specified that the provision did not apply to products. The claim category "products" included apparatus. Accordingly, the provisions of Art. 53(c) EPC did not normally apply to apparatus claims. The fact that some features of the claimed apparatus were functionally defined in relation to the body of the patient did not, in itself, transform the apparatus claim into a method claim (T 712/93, T 1695/07; see also T 1407/08).

4.3.5 Avoiding the exclusion of methods of treatment by surgery from patent protection under Article 53(c) EPC

a) Claim cannot be left to encompass surgical step

The Enlarged Board in G 1/07 (OJ 2011, 134) confirmed the established case law of the boards of appeal, according to which a claim encompassing an embodiment which was excluded from patentability under Art. 53(c) EPC could not be left unamended. Contrary to what the appellant had argued, it found that this principle had been upheld in G 1/98 (OJ 2000, 111).

b) Disclaimer

The Enlarged Board in G 1/07 went on to say that the exclusion from patentability under Art. 53(c) EPC can be avoided by disclaiming an embodiment, it being understood that in order to be patentable the claim including the disclaimer must fulfil all the requirements of the EPC and, where applicable, the requirements for a disclaimer to be allowable as defined in decisions G 1/03 (OJ 2004, 413) and G 2/03 (OJ 2004, 448). Whether or not the wording of a claim can be amended so as to omit the surgical step without offending against the EPC must be assessed on the basis of the overall circumstances of the individual case under consideration (see T 923/08, in this chapter I.B.4.3.4 b)).

c) Methods only concerning the operation of a device

A typical class of cases in which the invention would be fully defined without requiring the presence of the potentially surgical step as a positive feature of the claim would be cases in which the invention only concerns the operating of a device. With respect to such inventions the boards of appeal have constantly held that a method which is only concerned with the operating of a device without any functional link between the claimed method and the effects produced by the device on the body does not qualify at all as a method for treatment within the meaning of Art. 52(4) EPC 1973 (Art. 53(c) EPC) (T 245/87, OJ 1989, 171, T 789/96, OJ 2002, 364). If, on the contrary, there is such a functional link the method is excluded from patentability (T 82/93, OJ 1996, 274).

In T 44/12 the board stated that, whether or not a method has to be considered a method for treatment of the human body by therapy is determined by the existence of a functional link or a direct influence of the method claimed in itself on a given therapy, such that the medical doctor's freedom of choice and of practice in this respect is hindered. In the present case the board considered that the subject-matter only concerned the operation of a device, without any functional link to the effects of the device on the body.

4.3.6 Data obtained during surgery

On the particular facts of the case before it, the Enlarged Board held in G 1/07 that a claimed imaging method is not to be considered as being a "treatment of the human or animal body by surgery" within the meaning of Art. 53(c) EPC, merely because during a surgical intervention the data obtained by the use of the method immediately allow a surgeon to decide on the course of action to be taken during a surgical intervention.

4.4. Therapeutic methods

Therapeutic methods are subject to a rule, similar to that applicable to surgical methods, that they cannot be patented if they include at least one feature defining a physical activity or action that constitutes a method step for treatment of the human or animal body by therapy (G 1/04, OJ 2006, 334; G 1/07, OJ 2011, 134).

4.4.1 The term "therapy"

a) Definition of the term

The first definition of the term was given in T 144/83 (OJ 1986, 301). According to this decision, therapy relates to the treatment of a disease in general or to a curative treatment in the narrow sense as well as the alleviation of the symptoms of pain and suffering.

It is established case law that a prophylactic treatment, aimed at maintaining health by preventing ill effects that would otherwise arise, amounts to a method for treatment by therapy as referred to in Art. 53(c) EPC, and that therapy is not limited to treatments which restore health by curing diseases which have already arisen (see e.g., G 5/83, OJ 1985, 64). Both prophylactic and curative methods of treating disease are covered by the word therapy, since both are directed to the maintenance or restoration of health (T 19/86, OJ 1989, 24; T 290/86, OJ 1992, 414; T 438/91, T 820/92, OJ 1995, 113).

In T 2420/13 the board stated that a "therapeutic treatment" required some intervention on the body or body part to be treated which caused a therapeutic effect.

The board in T 774/89 distinguished "therapy" from "performance improvement", finding that the purpose of therapy was invariably to restore the organism from a pathological to its original condition, or to prevent pathology in the first place, whereas a non-therapeutic improvement of performance took as its starting point a normal state (to be defined) (see T 385/09).

Therapeutic methods must also be distinguished from cosmetic methods. In G 1/07 (OJ 2011, 134) the Enlarged Board of Appeal pointed out that it was the express wording of Art. 53(c) EPC that only therapeutic methods were excluded from patentability (and thus cosmetic methods were not) and the exclusion could not be extended to treatments which were not therapeutic in character (see also T 1172/03 making reference to T 144/83, OJ 1986, 301).

b) Application in the case law

In T 81/84 (OJ 1988, 207) the question arose whether or not the character of menstrual discomfort manifesting itself for instance in intense headaches and other painful symptoms was such that its treatment should fall under the category of therapeutic treatment. The board found that the concept of therapy should not be construed narrowly. It would be impossible and undesirable to distinguish between basic and symptomatic therapy, i.e. healing or cure and mere relief. The board concluded that irrespective of the origin of pain, discomfort or incapacity, its relief, by the administration of an appropriate agent, was to be construed as therapy or therapeutic use within the meaning of Art. 52(4) EPC 1973.

In T 24/91 (OJ 1995, 512) the board observed that the term "therapy" was not restricted to curing a disease and removing its causes. Rather, this term covered any treatment which was designed to cure, alleviate, remove or lessen the symptoms of, or prevent or reduce the possibility of contracting any disorder or malfunction of the human or animal body. The board found that the claimed process removed, by treatment of the patient's eye, the symptoms of myopia, hyperopia and astigmatism and was therefore a therapeutic treatment.

In T 469/94 the question at issue was whether increasing the acetylcholine level in the brain and tissue and thereby reducing the perception of fatigue in a person about to participate in major exercise or having completed major exercise counts as therapeutic treatment of the human body. The board found that it did not, noting that the condition of fatigue induced by the performance of exercises was a transitory physiological condition caused by natural circumstances and removable by simple rest. Simple training was generally known to retard the perception of fatigue. Pain or serious suffering did not appear to be manifestations of fatigue, which therefore was not comparable with the pathological state typical of a disease or an injury. The board observed that the treatment for reducing the perception of fatigue was not even comparable with the relief of pain, discomfort and incapacity (see above T 81/84, OJ 1988, 207).

In T 74/93 (OJ 1995, 712) the claimed invention related to alicyclic compounds and their contraceptive use. The board took the view that a method of contraception was not excluded per se from patentability under the aspects of industrial application as stipulated in Art. 57 as well as in Art. 52(4), first sentence, EPC 1973 (now Art. 53(c) EPC). Pregnancy was not an illness and therefore its prevention was not in general therapy according to Art. 53(c) EPC (see also T 820/92, OJ 1995, 113; T 1635/09, OJ 2011, 542). Nevertheless, the method could not be patented. The board found that a method of contraception to be applied in the private and personal sphere of a human being could not be deemed susceptible of industrial application (see chapter I.E.1.2.1).

In T 241/95 (OJ 2001, 103) the board held that the selective occupation of a hormone receptor could not be considered as a therapeutic application; the discovery that a substance selectively binds the serotonin receptor, even if this represented an important piece of scientific knowledge, still had to find a practical application as a defined, real treatment of a pathological condition in order to make a technical contribution to the art and to be considered as an invention eligible for patent protection.

In T.1075/06 the board held that a method claim comprising the step of returning processed blood, depleted of some of its components and charged with an anticoagulant, to a donor is a method for treatment of the human body by therapy which is excluded from patentability under Art. 53(c) EPC.

According to the contested patent in case T.611/09, a lock solution was used for infusion into the lumen of an in-dwelling intravascular catheter, i.e. a catheter which was typically inserted into a vein or artery and therefore in intimate contact with the human or animal body. According to the board, this did not necessarily mean that the lock solution was also directly in contact with or even active within the human or animal body. The board concluded that the antibacterial activity only took place in the lumen, which was part of the catheter that was located outside of the human or animal body, which meant that it was not therapeutic.

In T.1819/13 the use of an antibiotic for the manufacture of a medicament for use in treating or preventing a bacterial infection in an animal by injection of the medicament subcutaneously at the junction of a pinna with the cranium of the animal was claimed. The site of injection was held to be an integral technical element of the administration of the medicament and thus of the therapeutic application. However, this feature of injection at a specific site did not make the claim violate Art. 53(c) EPC.

4.4.2 Methods with both therapeutic and non-therapeutic indications

Whether or not a claimed invention is excluded from patentability under Art. 53(c) EPC depends upon the wording of the claim in question (see T.820/92, OJ 1995, 113; T.290/86, OJ 1992, 414; T.780/89, OJ 1993, 440 and T.1077/93). As a general rule, it is irrelevant for the purposes of Art. 53(c) EPC whether there are other therapeutic effects in addition to the claimed non-therapeutic use if those additional therapeutic effects can be clearly distinguished from the non-therapeutic use and are not covered by the subject-matter of the claim. If, however, the scope defined by the wording of the claim encompasses a use comprising a non-therapeutic element which is inseparably associated with a therapeutic element and that latter element is an essential part of the claimed method, the method is non-patentable under Art. 53(c) EPC (T.1635/09, OJ 2011, 542; T.290/86, OJ 1992, 414).

a) Inevitable and inextricably linked therapeutic effect of the claimed method

In T.116/85 (OJ 1989, 13) the board held that a claimed method was excluded from patentability, if it rendered the therapeutic treatment of animals necessary, even though the therapeutic treatment of animals was commonly an aspect of agriculture, and agricultural methods were in general potentially patentable subject-matter. Here, however, the board did not consider it possible as a matter of law to draw a distinction between such a method as carried out by a farmer and the same method when carried out by a veterinarian, and to say that the method, when carried out by a farmer, was an industrial activity and, when carried out by a veterinarian, was a therapeutic treatment and thus not patentable.

According to **T.780/89** (OJ 1993, 440) the secondary effect of a therapeutic treatment did not render it patentable. The claim in question related to a method of general immunostimulation for animals. The applicant argued, inter alia, that this served to increase meat production and that the method was therefore not being used as a means of therapy. However, the board regarded the effect of increasing meat production as a consequence of the improvement in the animals' health. Moreover, the general stimulation of the immune system was integrally linked to the specific prophylactic function of safeguarding against particular infections.

In **T.438/91** the patentee contended that the main purpose of the claimed process was to increase the weight of the animals which effect was separable from the effect of prevention or cure of scours. This latter was merely a beneficial side effect. It was necessary to decide whether or not a method for breeding domestic animals in claims 1 and 2 related to a therapeutic or prophylactic treatment. The board noted that two effects were observed as a result of the breeding method claimed: (a) the remedying of scours and, (b) a weight increase in the animals being bred. The board found that, in the light of the patent disclosure, the two effects were linked by the single action of feeding the animals, and that the intention was to obtain both effects at the same time in animals suffering from scours (treatment by therapy) and to prevent the latter complaint in those animals which did not already have it (treatment by prophylaxis). In conclusion, the board was of the opinion that the subject-matter of claims 1 and 2 related to a therapeutic or prophylactic treatment of domestic animals and thus fell within the prohibition on patentability set out in Art. 52(4) EPC 1973.

In **T.290/86** (OJ 1992, 414) no method claim was considered allowable because the disclosed method of eliminating plaque inevitably had the therapeutic effect of preventing caries and periodontal disease; it therefore fell under the prohibition of Art. 52(4) EPC 1973 (now Art. 53(c) EPC) irrespective of the fact that the removal of plaque could also have the cosmetic effect of improving the appearance of the teeth. The board took the view that whether or not a claimed invention was excluded from patentability under Art. 52(4) EPC 1973 depended in particular on the wording of the claim in question. If the claimed invention was not directed solely to a cosmetic effect, but was also necessarily defining a treatment of the human body by therapy as well, such a claim was excluded from patentability (distinguishing **T.144/83**, OJ 1986, 301). The board held that if the claimed use of a chemical product inevitably always had a therapeutic effect as well as a cosmetic effect the invention as claimed necessarily defined a treatment of the human body by therapy and was not patentable (see also **T.475/12**).

In **T.1077/93** claims 1 and 11 related to the use of the cupric complex of 3,5-Diisopropyl salicylic acid (referred to in the following as CuDIPS) as a cosmetic product or in a cosmetic composition, and to a cosmetic treatment process, based on the use of this complex, for the protection of the human epidermis. The purpose of the patented composition was to protect the human epidermis against ultraviolet radiation: notably, to reduce the intensity of erythema, recognised as the most spectacular form of damage to the skin by sunlight, and of skin-level cellular changes such as the formation of degenerated and necrotised keratinocytes, generally known by the term "sunburn cells (SBC)". In its ruling, the board cited the point, already explored in **T.820/92** (OJ 1995, 113),

that the exclusion of therapeutic methods from patentability could not be avoided by a purely formal rewording of the claim to qualify the purpose of the process, in its indivisible entirety, as non-therapeutic. The board took the view that the examination as to patentability of claims 1 and 11 necessitated an examination of the mechanism by which CuDIPS acted, and of the relationship between all its effects. The board concluded that at least part of the protective effect did not derive from a simple filtering at the level of the skin surface, but rather from an interaction with the cellular mechanisms in the epidermis, with the purpose of preventing a pathological state (erythema); therefore the process had a genuine therapeutic effect.

According to T 1635/09 (OJ 2011, 542) use as an oral contraceptive of a composition in which the claimed concentrations of the hormone content are selected at such a low level as to prevent or reduce the likely pathological side-effects of such an oral contraceptive is a therapeutic method excluded from patentability under Art. 53(c) EPC. The board held that the prevention of side-effects – which was affirmed in claim 1 by the indication of the concentrations of active substance and which, in the light of the pathological nature of the secondary effects, clearly had to be classed as therapeutic – was inseparably associated with the per se non-therapeutic contraceptive process.

In T 158/13 it was not possible to distinguish between a therapeutic or non-therapeutic use of the stimulative perfume composition, since the way of administering the composition was the same for a therapeutic and a non-therapeutic use. Sleepiness or inactivity in daily life may not only be a physiological condition, but may also arise from a pathological condition. Without a clear and unambiguous distinction between a physiological and a pathological nature of a person's mental condition, a clear distinction between therapeutic and non-therapeutic use is also impossible.

b) Therapeutic and non-therapeutic effects distinguishable

In T 144/83 (OJ 1986, 301) the board accepted the patentability of a claim worded in such a way that it clearly sought protection for a method of treating the human body for cosmetic purposes but not for the therapeutic application which was also possible. The board pointed out that the language of the claim in question clearly covered a method of cosmetic use and was unrelated to the therapy of a human or animal body in the ordinary sense. The board held that the fact that a chemical product had both a cosmetic and a therapeutic effect when used to treat the human or animal body did not render the cosmetic treatment unpatentable.

In T 36/83 (OJ 1986, 295) the description expressly disclosed two very different properties of a compound used in the treatment of comedones, i.e. its anti-bacterial and its hygienic action. The application showed that pharmaceutical and cosmetic preparations could have very similar, if not identical, forms. The distinction was clearly set out in the description as filed. The board decided that the cosmetic application of a product which also had a therapeutic use was patentable, since the applicants had only claimed in respect of "use as a cosmetic product". The use of the term "cosmetic" was held to be sufficiently precise, although the cosmetic treatment according to the application might also incidentally involve a medical treatment.

In T.469/94 it had to be ascertained whether the non-therapeutic effect according to the application at issue was distinguishable from the therapeutic effect of choline. The board found that the two effects of choline were not inseparably linked or correlated but, on the contrary, were readily distinguishable because they involved groups of persons (or patients) undoubtedly distinct. The one consisted of patients known to have a muscular disease, muscular injury or epilepsy, whereas the second comprised healthy persons who would receive no therapeutic benefit from the treatment. Moreover, the times necessary for appreciating the different effects (days for the therapeutic effect and minutes or hours for the non-therapeutic effect) would appear to be so different that no unwanted overlap of the treatment could occur. Therefore, the board held that the claim in question was directed to a non-therapeutic method.

4.4.3 Avoiding the non-patentability under Article 53(c) EPC of methods with therapeutic effect

One way of escaping the exception to patentability is a disclaimer, but the claim featuring the disclaimer must then meet all the EPC requirements (see also in this chapter I.B.4.3.5). In T.774/89 the board accepted the patentability of using a medication to increase milk production in cows, because it was evident that the success of the treatment did not depend on the animals' state of health, and the insertion in the claim of the term "non-therapeutic" served as a disclaimer, excluding the therapeutic effects of the medication.

According to T.1635/09 (OJ 2011, 542), the following applies to claims encompassing both therapeutic and non-therapeutic uses: a disclaimer "non-therapeutic" allows for the exclusion of therapeutic uses from a claim encompassing both therapeutic and non-therapeutic uses in such a way that they are substantively separable, so that the remaining subject-matter is no longer covered by the exception to patentability under Art. 53(c) EPC. However, such a disclaimer cannot be employed to define as non-therapeutic a use which – like that at issue in this case – necessarily includes one or more therapeutic steps, since the question whether or not a claimed use is therapeutic can be decided only in the light of the activities carried out, or the effects achieved, in the course of that use.

4.5. Diagnostic methods

Under Art. 53(c) EPC diagnostic methods practised on the human or animal body are also excluded from patentability. However, the boards construe the exception applicable to diagnostic methods more narrowly than that applicable to surgical and therapeutic methods.

4.5.1 Opinion G.1/04 of the Enlarged Board of Appeal

The President of the EPO made a referral to the Enlarged Board of Appeal on points of law relating to the interpretation of the term "diagnostic methods practised on the human or animal body". The Enlarged Board of Appeal emphasised in opinion G.1/04 (OJ 2006, 334) that its interpretation of the scope of the exclusion from patentability under

Art. 52(4) EPC 1973 in respect of diagnostic methods practised on the human or animal body would remain valid under the EPC 2000.

a) What constitutes "diagnostic methods"

One of the points referred concerned interpretation of "diagnostic methods". The Enlarged Board gave it a narrow interpretation: in order that the subject-matter of a claim relating to a diagnostic method practised on the human or animal body falls under the prohibition of Art. 52(4) EPC 1973, the claim is to include the features relating to: (i) the diagnosis for curative purposes *stricto sensu* representing the deductive medical or veterinary decision phase as a purely intellectual exercise, (ii) the preceding steps which are constitutive for making that diagnosis, and (iii) the specific interactions with the human or animal body which occur when carrying those out among these preceding steps which are of a technical nature.

The Enlarged Board of Appeal pointed out that the surgical or therapeutic nature of a method claim could be established perfectly by a single method step without contravening Art. 84 EPC 1973. Diagnostic methods, however, differed in this respect from the methods of surgery and therapy. The method steps to be carried out prior to making a diagnosis as an intellectual exercise were related to examination, data gathering and comparison. If only one of the preceding steps which were constitutive for making such a diagnosis were lacking, there was no diagnostic method, but at best a method of data acquisition or data processing that could be used in a diagnostic method (see T.385/86). It followed that, whilst the surgical or therapeutic nature of a method claim could be achieved by a single method step, several method steps were required to define a diagnostic method due to the inherent and inescapable multi-step nature of such a method.

b) Involvement of practitioner

The Enlarged Board of Appeal held that the classification of an activity as having a diagnostic character did not depend on who was involved. The wording of Art. 52(4) EPC 1973 (now Art. 53(c) EPC) was unequivocal in that the exclusion related only to the method, and not to the person carrying out the method. To allow the grant of a European patent to depend on the involvement of such a person would therefore introduce legal uncertainty into the patent granting procedure. Thus, whether or not a method was a diagnostic method should depend neither on the participation of a medical or veterinary practitioner, through being present or bearing the responsibility, nor on the fact that all method steps could also, or only, be practised by medical or non-medical support staff, the patient himself or herself or an automated system (see also G 1/07, OJ 2011, 134). Moreover, no distinction is to be made in this context between essential method steps having diagnostic character and non-essential method steps lacking it.

c) The criterion "practised on the human or animal body"

Art. 52(4) EPC 1973 (Art. 53(c) EPC) required that, to be excluded from patent protection, diagnostic methods had to be practised on the human or animal body. The Enlarged Board of Appeal held that in a diagnostic method, the method steps of a technical nature

belonging to the preceding steps which were constitutive for making the diagnosis for curative purposes *stricto sensu* must satisfy the criterion "practised on the human or animal body".

This criterion was to be considered only in respect of method steps of a technical nature. Thus, it did not apply to diagnosis for curative purposes *stricto sensu*, i.e. the deductive decision phase, which as a purely intellectual exercise could not be practised on the human or animal body.

Art. 52(4) EPC 1973 did not require a specific type and intensity of interaction with the human or animal body; a preceding step of a technical nature thus satisfied the criterion "practised on the human or animal body" if its performance implied any interaction with the human or animal body, necessitating the presence of the latter.

Further, the grant of a European patent in respect of a diagnostic method which included preceding method steps of a technical nature carried out by a device did not contravene Art. 52(4) EPC 1973, because the performance of the respective method steps did not satisfy the criterion "practised on the human or animal body". However, in the event of patent protection, it would normally be sufficient to purchase the device in question in order to be entitled to carry out such a method. In cases where the same diagnostic conclusions could be reached by a method not including the use of the device, those carrying it out would not be inhibited by the patent. Therefore, medical or veterinary practitioners could not be considered to be hampered by the existence of such a patent.

d) Clarity of a claim relating to diagnostic methods

If diagnosis as the deductive medical or veterinary decision phase was a purely intellectual exercise, the feature pertaining to the diagnosis for curative purposes and the features relating to the preceding steps which were constitutive for making the diagnosis represented the essential features of a diagnostic method. Thus, in order to satisfy the requirements of Art. 84 EPC 1973, an independent claim relating to such a method had to include these features. If a non-technical feature was to be regarded as constitutive for defining the invention, it had likewise to be included as an essential feature in the independent claim.

e) Intermediate findings of diagnostic relevance

The Enlarged Board of Appeal stated that intermediate findings of diagnostic relevance must not be confounded with diagnosis for curative purposes *stricto sensu*, which consisted in attributing the detected deviation to a particular clinical picture. It followed that a method for obtaining such results or findings did not constitute a sufficient basis for denying patentability by virtue of Art. 52(4) EPC 1973. To decide otherwise would give rise to such a broad interpretation of the scope of the exclusion from patentability with regard to diagnostic methods – that it could hardly be reconciled with the requirement of legal certainty.

4.5.2 Case law applying the principles developed in G 1/04

In T 1197/02 the invention related to a method of assessing the presence of glaucomatous damage to the visual system of a subject. The board explained that since the criterion "practised on the human or animal body" in Art. 52(4) EPC 1973 was to be considered only in respect of method steps which are of a technical nature (G 1/04, OJ 2006, 334, points 6.4.1 and 6.4.4 of the Reasons), it neither applied to the deductive decision phase, nor to those steps which consisted in comparing the data collected in the examination phase with standard values and in finding a significant deviation resulting from the comparison. These activities were principally of a non-technical nature and normally not practised on the human or animal body. It followed that in most cases, only the step which referred to the examination phase and involved the collection of data could actually be of a technical nature and, therefore, concerned with the criterion "practised on the human or animal body". Additional intermediate steps which concerned for example the adjustment or preparation of the apparatus with which the collection of data would be performed could be introduced into a method claim for completeness. However, since these additional features were not part of one of the steps necessary for making the diagnosis, they were to be ignored when assessing the diagnostic character of the method. The issue of whether or not these intermediate features were of a technical nature and practised on the human or animal body was, therefore, irrelevant for this question.

In T 143/04 claim 1 at issue related to a method of diagnosing Alzheimer's disease in a living subject. The board noted that data processing using an automated apparatus was not actually part of the examination phase which involved the data collection phase, but it resulted from a subsequent, technical step, intermediate between the data collection and the comparison of these collected data with standard values. Such intermediate steps were not to be considered when assessing the diagnostic character of the method. The claim at issue included all the features of a diagnostic method practised on the human or animal body as defined in the opinion G 1/04. The patenting of such a method was prohibited by Art. 52(4) EPC 1973 (Art. 53(c) EPC).

C. Novelty

1.	General	71
2.	State of the art	71
2.1.	General	71
2.2.	Applications with same filing or priority date	72
2.3.	Relevant date of documents	72
2.4.	Prior rights – Article 54(3) EPC	72
2.4.1.	European prior rights	72
2.4.2.	Applicability of Article 54(3) EPC in cases of potentially colliding European parent and divisional applications	73
2.4.3.	Excluded national prior rights	74
2.4.4.	PCT applications as state of the art	74
2.5.	Non-prejudicial disclosures under Article 55 EPC	75
2.6.	In-house knowledge not published before the priority date	76
2.7.	Prior art acknowledged in a patent application	76
2.8.	Common general knowledge	77
2.8.1.	Definition of "common general knowledge"	77
2.8.2.	Patent specifications as common general knowledge	78
2.8.3.	Specialist journals as common general knowledge	78
2.8.4.	Databases as common general knowledge	79
2.8.5.	Proof of common general knowledge	79
3.	Availability to the public	81

8.1.5	Novelty criteria for product claims with purpose characteristics	171

1. General

An invention can be patented only if it is new. An invention is considered to be new if it does not form part of the state of the art. The purpose of [Art. 54\(1\) EPC](#) is to prevent the state of the art being patented again ([T 12/81](#), OJ 1982, 296; [T 198/84](#), OJ 1985, 209).

The first step in deciding whether an invention is new is to define the prior art, the relevant part of that art, and the content of that relevant art. The next is to compare the invention with the prior art thus defined, and see whether the invention differs from it. If it does, the invention is novel.

As part of the EPC 2000 revision, several amendments were made to [Art. 54 EPC](#). [Art. 54\(1\) and \(2\) EPC](#) remained unchanged. In [Art. 54\(3\) EPC 1973](#) a reference to [Art. 93 EPC](#) was removed. [Art. 54\(4\) EPC 1973](#) was deleted, so that any European application falling under [Art. 54\(3\) EPC](#) constitutes prior art with effect for all the EPC contracting states at the time of its publication. The amendment to [Art. 54\(5\) EPC 1973](#) (now [Art. 54\(4\) EPC](#)) took account of the deletion of [Art. 54\(4\) EPC 1973](#) and the incorporation of [Art. 52\(4\) EPC 1973](#) into [Art. 53\(c\) EPC](#) (exceptions to patentability). New [Art. 54\(5\) EPC](#) now eliminates any legal uncertainty on the patentability of further medical uses. It unambiguously permits purpose-related product protection for each further new medical use of a substance or composition already known as a medicine (see OJ SE 4/2007).

2. State of the art

2.1. General

Under [Art. 54\(2\) EPC](#), the state of the art comprises everything made available to the public by means of a written or oral description, by use, or in any other way, **before** the filing or priority date of the European patent application.

As a rule, there are no restrictions as to where, how or in what language the relevant information must have been made available to the public; nor is any limit stipulated as to how old the documents or other sources of the information may be (Guidelines G-IV, 1 – November 2018 version).

2.2. Applications with same filing or priority date

An application with the same filing or priority date as the application to be examined is not part of the state of the art (see T 123/82).

2.3. Relevant date of documents

For the purposes of determining novelty, a prior document should be read as it would have been read by a person skilled in the art on its "relevant date". The relevant date of a previously published document is its publication date, and that of a document within the meaning of Art. 54(3) EPC its date of filing (or, as the case may be, priority date) (Guidelines G-VI, 3 – November 2018 version).

According to the boards' established case law, for ascertaining the disclosure of a document forming part of the state of the art within the meaning of Art. 54(2) EPC, the relevant date is that of publication (see T 205/91, T 737/00, T 1162/07). The date is conveniently taken as the publication date of the document, because in normal situations, the meaning to be attributed to the various technical terms of the document does not vary until its publication so that its content can be analysed as if it had been written on the date it was made available to the public. In the particular situation in the case in hand, however, where a technical term such as a trade name was known to have been abandoned between the filing or priority date and the publication date, this circumstance is to be taken into account (T 2020/13).

For the purposes of examining novelty, a document is to be assessed from the perspective of the skilled person on the publication date, T 305/94. Interpreting a document using knowledge which only became available to the relevant experts between the publication date of the cited prior art and the filing or priority date of the application to be examined or the patent in dispute is an issue relating to **inventive step, not novelty** (see T 205/91).

2.4. Prior rights – Article 54(3) EPC

2.4.1 European prior rights

Pursuant to Art. 54(3) EPC the content of European patent applications as filed, the dates of filing of which are prior to the date referred to in Art. 54(2) EPC and which were published on or after that date, shall be considered as comprised in the state of the art. However, such earlier applications are part of the state of the art only when considering novelty and **not when considering inventive step**. The "date of filing" referred to in Art. 54(2) and (3) is thus to be interpreted as meaning the date of priority in appropriate cases (see also Guidelines G-IV, 5.1 – November 2018 version).

As part of the 2000 revision of the EPC, former Art. 54(4) EPC 1973 was deleted, so that any European application falling under Art. 54(3) EPC constitutes prior art with effect for all the EPC contracting states at the time of its publication. The revised Art. 54(3) EPC is applicable to European patent applications filed on or after the time the EPC 2000 entered into force. The deleted Art. 54(4) EPC 1973 is still applicable to European patents already granted and applications pending at the time the EPC 2000 entered into force.

In T 1926/08, in order to establish novelty with respect to document D1, the patent proprietors had filed two sets of claims for different contracting states. The patent at issue was granted before the date of entry into force of the EPC 2000. The point of dispute was whether or not R. 87 EPC 1973 was a rule implementing Art. 54(4) EPC 1973, or whether the situation was covered by Art. 123 and R. 138 EPC. R. 87 EPC 1973 allowed different claims, description and drawings for different states both in the case of an earlier European patent application which was part of the state of the art under Art. 54(3) and (4) EPC 1973 and when a prior national right existed, while R. 138 EPC 2000 only provided for the latter case. The board held that R. 87 EPC 1973 applied to European patents granted before the entry into force of EPC 2000 because it is an implementing regulation to Art. 54(4) EPC 1973 and admitted a separate set of claims.

In J 5/81 (OJ 1982, 155) the board held that a published European patent application became part of the state of the art under Art. 54(3) EPC 1973, with retroactive effect as from its filing date or priority date, for assessing applications filed after that filing date or priority date but prior to its publication, but that this should only apply if such a "prior application" was still in existence at the time of publication.

In T 447/92 the whole contents of an earlier document within the meaning of Art. 54(3) and (4) EPC 1973 had to be considered as forming part of the state of the art as far as novelty was concerned. The board pointed out that the boards of appeal had consistently applied a very restrictive interpretation of disclosure in order to reduce the risk of self-collision. To do otherwise would, in the board's view, undesirably undermine the exclusion from consideration of documents within the meaning of Art. 54(3) EPC 1973 when deciding whether there had been an inventive step.

2.4.2 Applicability of Article 54(3) EPC in cases of potentially colliding European parent and divisional applications

In T 557/13 of 17 July 2015 several questions concerning partial priorities were referred to the Enlarged Board of Appeal (G 1/15, OJ 2017, A82), see in particular question 1 and 5: 1. Where a claim of a European patent application or patent encompasses alternative subject-matters by virtue of one or more generic expressions or otherwise (generic "OR"-claim), may entitlement to partial priority be refused under the EPC for that claim in respect of alternative subject-matter disclosed (in an enabling manner) for the first time, directly, or at least implicitly, and unambiguously, in the priority document? 5. If an affirmative answer is given to question 1, may subject-matter disclosed in a parent or divisional application of a European patent application be cited as state of the art under Art. 54(3) EPC against subject-matter disclosed in the priority document and encompassed as an alternative in a generic "OR"-claim of the said European patent

application or of the patent granted thereon? See chapter II.D.5.3. "Multiple priorities or partial priority for one claim". Question 1 was answered in the negative by **G 1/15** (OJ 2017, A82). As a consequence, questions 2, 3, 4 and 5 did not need to be dealt with.

2.4.3 Excluded national prior rights

In **T 550/88** (OJ 1992, 117) the board made it clear that, on the proper interpretation of Art. 54(3) EPC 1973, prior national rights were not comprised in the state of the art. The effect of a prior national right upon a European patent was a matter purely for national law, whereas the effect of a prior European application upon a European patent was specifically provided for in Art. 54(3) EPC 1973 (which might also be a ground for revocation under national laws by virtue of Art. 138(1)(a) EPC 1973). In other words, the combined effect of Art. 138(1) and 139 EPC 1973 was to provide an additional possible ground for revocation under national laws based upon the existence of a prior national right, which was not available under Art. 54 EPC 1973.

In **T 1698/09** the board observed that, under Art. 54(3) EPC, the state of the art comprised the content of European patent applications filed before the priority date of the patent in suit and published after that date. It held that a German utility model was not a German or a European patent application. It made no difference that Germany had been designated in the patent in suit.

2.4.4 PCT applications as state of the art

Art. 153(5) EPC states that a Euro-PCT application shall be considered as comprised in the state of the art under Art. 54(3) EPC if the conditions laid down in Art. 153(3) or (4) EPC "and in the Implementing Regulations" are fulfilled.

Pursuant to R. 165 EPC a Euro-PCT application shall be considered as comprised in the state of the art under Art. 54(3) EPC if in addition to the conditions laid down in Art. 153(3) or (4) EPC (publication of the international application or its translation), the filing fee under R. 159(1)(c) EPC has been paid. Thus once the filing fee is paid for the conflicting application, it is considered to be an Art. 54(3) EPC application.

Under former Art. 158(2) EPC 1973, a Euro-PCT application was considered to be an Art. 54(3) EPC application if a translation was filed (where necessary) and the national fee paid.

In **T 404/93** the European patent application was limited to the contracting states Italy (IT), Netherlands (NL) and Sweden (SE) in view of an earlier international application, published after the filing date of the former. The board noted that the earlier PCT application had mentioned several EPC contracting states, including IT, NL and SE, as being designated for a European patent. However, when the earlier application had entered the European phase, no designation fees had been paid for IT, NL and SE. Accordingly, the board found that the earlier international application was not comprised in the state of the art under Art. 54(3) EPC 1973 for IT, NL and SE (see also **T 623/93**).

In T 622/91 the respondent (patent proprietor) requested that the decision under appeal be set aside and the patent maintained for all designated contracting states. Two earlier international applications and the European patent had designated the contracting state France (FR). The board noted that the requirements of Art. 158(2) EPC 1973 (now Art. 153(3) and (4) EPC and R. 159 EPC) were fulfilled, and considered the international applications as comprised in the state of the art relevant to the patent in suit in accordance with Art. 54(3) and Art. 158(1) EPC 1973 (now Art. 153(5) EPC). The board went on to examine claim 1 of the main request and found that the earlier application was novelty-destroying in so far as the same contracting state FR was designated.

In T 1010/07 the board held that E4, a document cited in relation to inventive step which had been published before the priority date of the contested patent, was a publication under Art. 158(3) EPC 1973, i.e. the publication of a translation supplied to the EPO under Art. 158(2) EPC 1973 into an EPO official language (English) of an international application not published in an official language (Japanese). Although translations under Art. 158(2) EPC 1973 were not checked by the EPO, it was presumed that their content was identical to that of the published international application (see e.g. T 605/93). Only when there were reasonable grounds to doubt this presumption in a particular case was further investigation and, where necessary, the production of evidence required. Thus, as a translation of identical content, E4 was to be regarded as forming part of the prior art.

2.5. Non-prejudicial disclosures under Article 55 EPC

Art. 55 EPC specifies that a disclosure of the invention shall not be taken into consideration for the application of Art. 54 EPC, if it occurred no earlier than six months preceding the filing of the European patent application and if it was due to, or in consequence of: (a) an evident abuse in relation to the applicant or his legal predecessor, or (b) the fact that the applicant or his legal predecessor has displayed the invention at an official, or officially recognised, international exhibition.

In consolidated cases G 3/98 (OJ 2001, 62) and G 2/99 (OJ 2001, 83) the Enlarged Board ruled that, when calculating the six-month period under Art. 55(1) EPC 1973, the relevant date is that of the actual filing of the European patent application, not the priority date.

In T 173/83 (OJ 1987, 465) the board ruled that there would be evident abuse within the meaning of Art. 55(1)(a) EPC 1973 if it emerged clearly and unquestionably that a third party had not been authorised to communicate to other persons the information received. Thus there was abuse not only when there was the intention to harm, but also when a third party acted in such a way as to risk causing harm to the inventor, or when this third party failed to honour the declaration of mutual trust linking him to the inventor.

In T 585/92 (OJ 1996, 129) the board found that where a patent application was published early by a government agency as a result of an error, this was not of necessity an abuse in relation to the applicant within the meaning of Art. 55(1)(a) EPC 1973, however unfortunate and detrimental its consequences might turn out to be. In order to determine whether there was an abuse within the meaning of Art. 55(1)(a) EPC 1973, the state of mind of the "abuser" was of importance.

In [T 436/92](#) the board found that deliberate intention to harm the other party would constitute evident abuse, as would also, probably, knowledge of the possibility of harm resulting from a planned breach of confidentiality. The state of mind of the "abuser" was of central importance (confirming [T 585/92](#)). The board held that the appellant had not proven, on the balance of probability, that the publications had occurred in violation of the tacitly agreed confidentiality. In other words, the publication was not an evident abuse within the meaning of [Art. 55\(1\) EPC 1973](#).

2.6. In-house knowledge not published before the priority date

It is the consistent view of the boards of appeal that in-house knowledge or matter which cannot be identified as forming part of the state of the art within the meaning of [Art. 54\(2\) EPC](#) is irrelevant for substantive patentability ([T 1247/06](#), see also [T 654/92](#), [T 1001/98](#), [T 671/08](#), [T 2434/09](#)).

In [T 1001/98](#) the board did not consider it appropriate either for itself or for the examining division to base an assessment of substantive patentability (**novelty and inventive step**) upon subject-matter not identified as forming part of the state of the art within the meaning of [Art. 54\(2\) EPC 1973](#). That was consistent with a number of previous decisions of the boards of appeal (such as [T 654/92](#)). In view of the appellant's declaration that the arrangement of figures 7(a) and 7(b) of the patent application was in-house knowledge not published before the priority date of the patent and given that the European search report did not reveal any corresponding document, the board reached the conclusion that the arrangement concerned could not be treated as being comprised in the state of the art within the meaning of [Art. 54\(2\) EPC 1973](#) (see also [T 1247/06](#)).

2.7. Prior art acknowledged in a patent application

According to the established case law of the boards of appeal (see [T 654/92](#), [T 691/94](#), [T 87/01](#), [T 730/05](#), [T 1449/05](#), [T 211/06](#)), the prior art cited and acknowledged in a patent application for the purpose of formulating the technical problem may be used as the starting point for assessing novelty and inventive step ([T 628/07](#)).

In [T 654/92](#) the board stated that the expression "background art" in the English version of [R. 27\(1\)\(b\) EPC 1973](#) was to be interpreted as referring to prior art within the meaning of [Art. 54\(2\) EPC 1973](#). The practice of starting out from art known to the applicant but not public at the claimed priority date was inconsistent with the requirements of the EPC. Any such art had to be ignored in an assessment of inventive step.

On the question whether an applicant may resile from its indication of background art, either implicitly or explicitly, some boards have taken the view that, unless resiled from or clearly not prior art for other reasons, it may be relied upon as prior art (see [T 654/92](#), [T 691/94](#), [T 730/05](#), [T 1449/05](#), [T 1554/05](#), [T 211/06](#) and [T 413/08](#)).

In [T 413/08](#) the board stated in the absence of any indication to the contrary, an acknowledgment of prior art by a patent proprietor might be accepted at face value. If a patent proprietor resiled from an acknowledgment of prior art at a point in time which did

not give rise to any procedural problems, the acknowledgement could no longer be relied upon.

2.8. Common general knowledge

2.8.1 Definition of "common general knowledge"

Determining what constitutes common general knowledge plays an important role in the assessment of **novelty, inventive step and sufficiency of disclosure**. In the assessment of inventive step and sufficiency of disclosure however, the skilled person's knowledge is taken to be one and the same, see chapters I.D.8.3. "Skilled person – level of knowledge" and II.C.4. "Knowledge of skilled person relevant for assessing sufficiency of disclosure" for other decisions on common general knowledge.

According to established case law, common general knowledge is to be found in basic handbooks, monographs, encyclopaedias, textbooks and reference books. It is knowledge that an experienced person in the field in question is expected to have, or at least to be aware of, to the extent that he knows he could look it up in a book if he needed it. Statements in such works are often used as references to show what common knowledge is (T 766/91, T 234/93, T 590/94, T 671/94, T 438/97, T 1253/04, T 1641/11).

However, Art. 54(2) EPC 1973 does not limit the state of the art to written disclosure in specific documents only; rather it defines it as including "any other way" by which technical subject-matter is made available to the public. Therefore, the absence of a reference to a particular document does not mean that there is no state of the art, as this could reside solely in the relevant common general knowledge, which, again, might be in writing, i.e. in textbooks or the like, or be simply a part of the unwritten "mental furniture" of the notional "person skilled in the art" (T 939/92, OJ 1996, 309; T 329/04).

In T 766/91 the board stated that by its very nature common general knowledge could be inferred from a number of sources, and proof that something was general knowledge in a particular art did not depend on proof of any particular document being published at a particular date.

In T 786/00 the board stated that, according to established case law, when considering the question of novelty, a prior art document must be interpreted in the light of common general knowledge available at its publication date. Common general knowledge which did not exist at this date, but which only became available at a later date, could not be used to interpret such a document (cf. T 229/90, T 965/92).

In T 1117/14 the application was silent about how the claimed biodegradable implant was to be produced. The board stated that, according to established case law, the skilled person may use his common general knowledge to supplement the information contained in the application. It was convinced that the method formed part of the common general knowledge in the field. Although it had not yet made its way into textbooks or monographs, it had been published in both the scientific and the patent literature and those skilled in the art relied on such articles and patent documents.

In T.2101/12 in the board's view the most suitable starting point was common general knowledge. The common general knowledge was the non-technical process of the signing of a contract at the notary's office. The board in T.2101/12 considered that the interpretation of Art. 54(2) EPC given in T.172/03 was incorrect. It held that the wording of Art. 54(2) EPC was clear and required no interpretation. Art. 54(2) EPC itself contains no limitation according to which a **non-technical process**, such as the signing of a contract at the notary's office, may not be considered state of the art.

2.8.2 Patent specifications as common general knowledge

General common knowledge does not normally include patent literature and scientific articles (T.206/83, OJ 1987, 5; T.171/84, OJ 1986, 95; T.307/11, T.1641/11, T.571/12, T.1000/12). By way of exception, however, patent specifications and scientific publications may be considered to be common general knowledge (see T.51/87, OJ 1991, 177; T.892/01; T.26/13; T.2196/15). In T.412/09 the board stated that this is so in particular when a series of patent specifications provides a consistent picture that a particular technical procedure was generally known and belonged to the common general knowledge in the art at the relevant date (see also T.151/05, T.452/05, T.1000/12). Special conditions also prevail when a field of research is so new that the technical knowledge is not yet available in textbooks (see T.51/87, OJ 1991, 177; T.772/89; T.892/01; T.890/02, OJ 2005, 497; T.1347/11). Going back as far as T.206/83 (OJ 1987, 5) it was held that information which could only be obtained after a comprehensive search was not to be regarded as common general knowledge (see also T.654/90, T.924/03). T.1634/15 and T.1540/14 (patent documents not entirely unambiguous) summarised the case law.

2.8.3 Specialist journals as common general knowledge

In T.475/88 the board's view was that the content of specialist journals, or "standard magazines", like the content of patent specifications did not usually belong to the common general knowledge of the average skilled person because it was not normally part of that person's active knowledge and had to be acquired through a comprehensive search. In T.676/94 the board concluded that the question of whether the contents of a specialist journal formed part of the average knowledge of a skilled person depended on the facts of the case. In T.595/90 (OJ 1994, 695), an article in a specialist journal reporting on the results of a classic test was regarded as common general knowledge.

Numerous publications in the specialist press over a fairly short time, reporting on meetings and research in a particularly active field of technology, could reflect common general knowledge in this field at that time (T.537/90). The board in T.26/13 observed that, although articles appearing in specialist journals were not, strictly speaking, part of the common general knowledge, the skilled person did read them for their own person development and so, taken together, they could permit inferences as to what that knowledge covered. See also T.2196/15, in which, by way of exception, a scientific article was taken into account.

2.8.4 Databases as common general knowledge

In T. 890/02 (OJ 2005, 497) the board pointed out that the skilled person did not necessarily have knowledge of the whole technology. Having regard to the case law, the board established three criteria for correctly assessing the common general knowledge of skilled persons. First, the skills of such a person included not only having basic general knowledge of the particular prior art, but also knowing where to find such information, be it in a collection of relevant studies (see T. 676/94), a scientific publication or a patent specification (see T. 51/87 and T. 772/89). Second, it could not be expected that, in order to identify this common general knowledge, the skilled person would carry out a comprehensive search of the literature covering virtually the whole state of the art. No undue effort in the way of such a search could be required of the skilled person (see T. 171/84, OJ 1986, 95; T. 206/83, OJ 1987, 5; T. 676/94). Third, the information found had to be unambiguous and usable in a direct and straightforward manner without doubts or further investigation (see T. 149/07).

In T. 890/02 the board concluded that whilst not being *stricto sensu* encyclopaedias or handbooks, databases (a) which are known to the skilled person as an adequate source for obtaining the required information, (b) from which this information may be retrieved without undue burden and (c) which provide it in a straightforward and unambiguous manner without any need for supplementary searches represent the common general knowledge of the skilled person as defined in the case law, and can be taken into account as such in deciding whether the teaching of a document which *prima facie* destroys novelty is sufficient to be reproducible.

2.8.5 Proof of common general knowledge

Where an assertion that something is common general knowledge is challenged, the person making the assertion must provide proof that the subject-matter in question is in fact common general knowledge (T. 438/97, T. 329/04, T. 941/04, T. 690/06, T. 2132/16). In the case of any dispute as to the extent of the relevant common general knowledge this, like any other fact in contention, has to be proved, for instance by documentary or oral evidence (T. 939/92, OJ 1996, 309, see also T. 766/91, T. 1242/04, OJ 2007, 421; T. 537/90, T. 329/04 and T. 811/06). The proof is regularly supplied in citing literature (T. 475/88). According to T. 766/91 and T. 919/97, evidence of general technical knowledge need be submitted only if the latter's existence is disputed.

In *ex parte* case T. 1090/12 the appellant drew attention to section G-VII, 3.1 of the Guidelines (unchanged in the November 2018 version) that reads: "an assertion that something is common general knowledge need only be backed by documentary evidence (for example, a textbook) if this is contested" and submitted that this passage was binding on the boards of appeal when exercising the power of the examining division. In the case at hand, the board denied that it was obliged to provide written evidence and explained during the oral proceedings that its members knew from their work on previous cases that the features at issue were known to the person skilled in the art. It would therefore have been for the appellant to show an error in the board's appreciation, e.g. that one of the features at issue was in fact introduced into the art after the priority date of the application

under appeal. There is also no general obligation on a board to provide documentary evidence for the existence of a piece of common general knowledge. In proceedings before the EPO, a board of appeal has to respect the right to be heard and to give reasons for its decision. In cases where a board refers to common general knowledge as state of the art, it is not obliged to provide documents in every conceivable case. It is also possible for a board to state what it deems to be known, and possibly where it is known from, in a way that puts the appellant in a position to try to convince the board that its findings are erroneous. Proceeding that way respects the party's right to be heard. In this respect, the request for referral of questions to the Enlarged Board of Appeal was refused.

In T.1540/14, another ex parte case, the board, after giving detailed reasons and summarising the case law on ascertaining the common general knowledge, concluded that there was not enough conclusive evidence to support the examining division's reasons for refusing the application for lack of inventive step because the features distinguishing its claim 1 from the closest prior art were obvious in view of the common general knowledge illustrated by two patent literature documents.

In ex parte case T.2101/12 the common general knowledge was the non-technical process of the signing of a contract at the notary's office. According to the appellant, the EPO has the burden of proving the content of the common general knowledge it relies on. The appellant had at no point disputed that the process mentioned by the board was indeed common general knowledge. No documentary evidence was required to prove the extent of the cited common general knowledge.

In T.1110/03 (OJ 2005, 302) the board stated that when evaluating evidence relating to the issues of novelty and inventive step it was necessary to distinguish between a document alleged to be part of the state of the art within the meaning of Art. 54(2) EPC 1973 – in the sense that the document itself was alleged to represent an instance of what had been made available to the public before the priority date of the opposed patent – and a document which was not itself part of the state of the art, but which was submitted as evidence of the state of the art or in substantiation of any other allegation of fact relevant to issues of novelty and inventive step. Only a document of the first kind could be disregarded on the sole ground that it was post-published; documents of the second kind did not stand or fall by their publication date even on issues of novelty and inventive step. Similarly a technical review article is by definition an account of the common general knowledge in the art prior to its own publication date – which could bear inter alia on the issue of enabling disclosure of a republished document and hence on the novelty of claimed subject-matter (T.1625/06, T.608/07, T.777/08).

In T.608/07 the respondent tried to query the relevance of D6 because it was published after the priority date of the patent in suit. The board stated that D6 related to published course material of a university and to subject-matter well known in the art for many years. Hence, albeit published after the priority date of the patent in suit, D6 provided indirect evidence for common general knowledge.

See also T.2196/15 for an example of difficulties in providing the common general knowledge.

3. Availability to the public

3.1. General

Pursuant to Art. 54(2) EPC the state of the art shall be held to comprise everything made available to the public by means of a written or oral description, by use, or in any other way, before the date of filing of the European patent application.

Board of appeal case law has established that the theoretical possibility of having access to information renders it available to the public (T 444/88), whatever the means by which the invention was made accessible, and – in the case of prior use – irrespective of whether there were particular reasons for analysing the product (G 1/92, OJ 1993, 27). This decision supersedes T 93/89 (OJ 1992, 718), T 114/90 and T 62/87 on this point. It is not relevant, as a matter of law, whether on that date a member of the public actually saw the document or knew that it was available (T 381/87, OJ 1990, 213). Particular problems may arise, depending on how the information is made available.

3.2. Ways of making information available to the public

3.2.1 Publications and other printed documents

a) General

For a written description to be regarded as having been made available to the public, it suffices that it was possible for the public to gain knowledge of its content without any obligation of confidentiality restricting the use or dissemination of such knowledge. As to whether written information contained in a document has been made publicly available, it is generally necessary to establish all the facts: where did the documents turn up; under what circumstances were the documents made accessible to the public, and who constituted the public in the case in question; was there any explicit or implicit confidentiality agreement; and when (date or period of time) were said documents publicly available (T 526/12).

b) Company papers

In T 37/96 the board had to decide on the public availability of some prior-art documents. Two of them were **typical company papers**. The board held that unlike scientific or technical journals, such papers as prospectuses or product descriptions could not be assumed to have automatically made their way into the public domain. On the contrary, whether they had indeed been available to the public on a given date depended on the particular circumstances and the evidence available (see also T 77/94, T 1017/01). In T 19/05 the board stated that the document was a company-generated technical paper and could thus not be assumed to have automatically made its way into the public domain.

In T 278/09, when examining whether a product data sheet had been available to the public, the board observed that such a sheet merely described the components and features of newly developed or improved products, but as such contained no evidence in

relation to marketing or any public availability. The decision whether and when to market a product could depend on other circumstances, such as the economic climate and the relevant firm's marketing policy. In any event, product data sheets did not necessarily become information destined for the public when it was decided to market the product they described, as customers to whom the sheet was distributed could be obliged to treat it as confidential. It was therefore insufficient in such a case to decide on the mere balance of probabilities that simple suppositions that an allegedly novelty-destroying product data sheet had been made available to the public were accurate (see also T.738/04). A product data sheet thus does not provide the same level of information as an advertising brochure (T.184/11, see below).

c) Advertising brochure

T.804/05 concerned the public availability of an advertising brochure usually distributed amongst interested specialists and bearing a date on its cover. The board decided that, in the absence of any evidence to the contrary, it had to be assumed that this brochure had been made available to interested customers, without any obligation to keep it secret, in the months following the cover date (see also T.1589/13 (internet publications) which stated that this presumption was supported by an affidavit and an invoice for printing of the advertising brochure).

In T.743/89 the board held that it was in the respondent's (patent proprietor) own interest to ensure widespread distribution of the commercial pamphlet in order to inform as many potential customers as possible of this latest development in a highly competitive field. Here, it had been proved that a leaflet disclosing the invention had been printed seven months before the date of priority, but it was uncertain when the leaflet had been distributed. The board took the view that, although the date of distribution could no longer be ascertained, it was reasonable in any event to assume that distribution had occurred within the seven-month period (see also T.1748/10).

In T.146/13 the proprietor maintained that the opponent had not supplied proof that a commercial brochure (D6) had been distributed before the priority date of the patent in suit. The board noted that there was a gap of more than 24 months between the date of printing and the priority date and, citing the established case law (T.287/86, T.743/89, T.804/05, T.1748/10), held that this was sufficiently long to presume that D6 had been made available to the public. The board was also convinced that it was standard practice not to print a commercial brochure unless it was to be distributed to interested groups with a view to attracting the attention of potential clients. The publisher of D6 had likewise had it printed in an effort to present its products and their advantages to its target market (see also T.184/11).

In T.77/94 the argument that a publicity notice's date of issue was necessarily immediately after its date of printing (because such notices were only produced in order to be issued) was held to be merely a supposition which required confirmation; in reality, things were often different (see also T.1440/04).

In T. 353/14 the board decided that D10 could not be considered a commercial brochure of a company which was intended to inform potential customers about particular products of the company as in cases T. 743/89, T. 253/02, and T. 804/05. Rather, document D10 had the nature of an applied electrical engineering paper. As such, the **copyright notice** and the revision mark could not be regarded as the date of printing of a stack of copies of D10 for their subsequent public distribution. D10 was not considered as having been made available to the public as a commercial brochure before the priority date. The public availability of D10 was then considered as to its availability on the internet (on the balance of probabilities).

In T. 523/14 it was highly probable that the opponent distributed the advertising newsletter in Fall 2007, given its strong interest in attracting as many customers as possible for the new equipment in the emerging and highly competitive field of solar power. Furthermore the board considered that even not drafted in a manner as rigorous as a scientific publication, the information given in the advertising newsletter was sufficient to enable a skilled reader to practise the technical teaching.

d) Report available in the specialist field

In T. 611/95 a research institute known in the field was in possession of a **report** anticipating the invention, which anyone could view at the institute or order from it on request. Two papers published prior to the priority date referred to this report and indicated where it could be obtained. In the board's view, the report was therefore publicly available. As far as availability to the public was concerned, the institute was not to be equated with a library, but the information in the documents had indicated to experts in the field that anyone could inspect or order the report there.

In ex parte case T. 1130/11 the appellant (applicant) contested that D3 was publicly available and argued that it did not belong to the prior art because it was marked as internal report. Before the oral proceedings, the board performed a limited investigation on the internet about D3 and presented its results to the appellant during the oral proceedings. The board concluded that in the field of universities "Interner Bericht" did not mean confidential, but something like "technical report", and that D3 was publicly available prior art at the priority date.

e) Books

In T. 842/91 the subject-matter of the claimed invention was included in a **book** to be published. Shortly before the priority date, the patent proprietor gave permission to the publisher to disclose the contents of the book. The board held that although the patent proprietor had clearly given the publisher permission to make the claimed subject-matter available to the public, this could not of itself amount to actually making it available.

In T. 267/03 it was ruled that binoculars depicted photographically in a book on binoculars, with the manufacturer's name and an approximate date of manufacture ("ca. 1960") far earlier than the date of filing of the patent in suit, constituted prior art for that patent in respect of the binoculars' internal structure.

In T. 915/12 the board considered that there was not sufficient evidence to prove that D16 – an extract from an encyclopedia – was made available to the public before the priority date (5 February 2001). The printing (2000) and **copyright** (1999) years indicated in D16 could not alone prove accessibility before early 2001. The handwritten annotation made by the head of Collections Department University on the cover page did not fulfil the requirements of form and content for affidavits.

f) Instruction manual

T. 55/01 concerned the public availability of an instruction manual, bearing a publication date, for the satellite receiver of certain makes of television set. The board observed that televisions were mass-produced consumer products which were rapidly distributed to the market without any obligation of confidentiality. It held that no further evidence was necessary to prove that televisions were actually sold to specified customers and that the handbook accompanying them was made available to the public within a period of about four months between their established production date and the priority date of the patent in suit, thereby taking into account the fact that events on the **mass market** such as the appearance of new television products were readily accessible to everybody, in particular to competitors, who would normally observe the market carefully. Hence, the balance of probabilities was the applicable standard of proof in cases such as this, as distinct from T. 472/92.

In T. 2105/12, concerning the public availability of a user guide and a testing guide for the same diabetes management system, carrying a **copyright date** (2002) which predated the earliest priority date (2006) of the patent in suit by about four years, the board concluded that like case T. 861/04 (copyright of television user manuals), the present case concerned a device which was free to be marketed. Therefore, as in decision T. 861/04, the board found it highly unlikely that it would have been kept in stock for about four years following Food and Drug Administration (FDA) approval.

g) Patent and utility models

T. 877/98 raised the question whether a German patent had become publicly available upon notification of the grant decision if the application had not been published previously. The board took the view that the patent had not become available until publication of grant in the patent bulletin; only from that point on was the file open for inspection. It thus endorsed the view of the German Federal Patents Court (decision of 23.12.1994, 4W(pat)41/94, BIFPMZ 1995, 324).

In T. 315/02 the board said that a **patent application not yet published** in its country of origin could form part of the state of the art within the meaning of Art. 54(2) EPC 1973 if it was accessible to the public as a priority document for a published European application.

In T. 355/07 the board held that German utility models were considered publicly available as of their date of entry in the Register of utility models of the German Patent and Trademark Office so that they represented prior art in terms of Art. 54(2) EPC. It was not relevant whether on that date a member of the public actually inspected the file.

h) Trade names

In T 2020/13, which concerned a catalyst composition and availability to the public of products defined by trade names, the board stated that where a technical term such as a **trade name** was known to have been abandoned between the filing or priority date and the publication date, this circumstance was to be taken into account in order to attribute to that technical term its proper meaning and to understand the technical teaching meant to be conveyed by that prior art document. The change of trade name did not render, in the circumstances of the case, the disclosure of example 6 of D1 unenabling. The board concluded that the nature of the catalysts behind the trade names was available to the public at the date of publication of D1 and that claim 1 lacked novelty.

On this issue in relation to Art. 83 EPC and its relationship to Art. 54 EPC, see T 842/14 (chemical composition of a product designated by a **trademark**).

i) Abstracts of documents

In T 160/92 (OJ 1995, 35) the board held that the teaching of a previously published abstract of a Japanese patent document, considered per se without its corresponding original document, formed prima facie part of the prior art and might be legitimately cited as such if nothing on the file pointed to its invalidity (T 462/96).

In T 1080/99 (OJ 2002, 568) the board held that in view of its legal nature and intended purpose, a Japanese patent abstract in English was a publication intended to reflect the technical content of the corresponding Japanese patent application for the purpose of quick prima facie information of the public, as was the purpose of any kind of abstract or summary of technical subject-matter. Hence the contents of such abstracts were to be interpreted, and possibly re-evaluated, in the light of the original document if the latter was available.

In T 243/96 it was established that the abstract of a document, on the basis of which the application in suit was refused, is an independent part of the prior art in its own right. However, in view of the inadequacy of this disclosure, and the divergent views on how the abstract should be interpreted, the board decided to introduce the full document into the appeal proceedings in the form of its English translation, it being understood that the full document took precedence over the abstract.

3.2.2 Lectures and oral disclosure

In T 877/90 an oral disclosure was regarded as having been made available to the public if, at the relevant date, it was possible for members of the public to gain knowledge of its content and there was no bar of confidentiality restricting their use or dissemination of such knowledge (see also T 838/97).

Where a written disclosure was published which was based on an oral disclosure at a public conference held some years earlier, it could not as a rule be assumed that the written disclosure was identical to the oral disclosure. Additional circumstances had to be

put forward and proven to justify that conclusion (T. 153/88). In T. 86/95, the board assumed that the disclosures were identical since it was highly unlikely that the speaker would have passed over such a salient feature at the conference.

In T. 348/94 the board confirmed that a written publication allegedly based on a paper previously read at a public meeting held some time earlier (in this case ten months) could not be assumed to be identical to what was orally disclosed, and might contain additional information. As to the extent of the oral disclosure, the burden of proof remained with the opponent.

In T. 1212/97 the opponent had submitted that the invention had been made available to the public at a lecture given some days before the priority date to an audience of some 100 to 200 persons. The question to resolve was whether there was any safe and satisfactory evidence regarding the content of what had been made available to the public at the lecture. The board did not consider **evidence from the lecturer alone** to be satisfactory evidence as to what had been made available to the public at the lecture. Even an audio or video tape recording made of the lecture, unless publicly available, would have to be treated with caution, if several hearings or viewings were necessary to extract all the information. Information appearing in each of the contemporary written notes made at the lecture by at least two members of the audience could usually be regarded as sufficient, whereas information in the notes of a single member of the audience might be inadequate, as it reflected the thoughts of the listener rather than solely the content of the lecture. If the lecturer read his lecture from a typescript or manuscript, or the lecturer wrote up his lecture subsequently, and the lecture was subsequently published in that form as part of the proceedings, then the written version might be taken as some evidence of the contents of the lecture, though with some caution as there would be no guarantee that a script was completely and comprehensibly read, or that a write-up had not been amplified. Most useful would be a handout given to the public at the lecture, containing a summary of the most important parts of the lecture and copies of the slides shown. None of those types of evidence were available in this case (see also T. 1057/09, T. 428/13, applying the principle, stated that the affidavit of the lecturer was not sufficient to give proof what was actually disclosed orally).

In T. 2003/08 of 31 October 2012 the board observed that, in contrast to a written document the contents of which are fixed and can be read again and again, an **oral presentation is ephemeral**. Therefore, the standard of proof for ascertaining the contents of an oral disclosure is high. What has been said, or to use the terms of Art. 54(2) EPC, what has been "made available to the public" has to be put beyond reasonable doubt. The board noted that in case T. 1212/97 the board had expressed the view that "written notes made at the lecture by at least two members of the audience can usually be regarded as sufficient" for that purpose. A fact also indicated by the board was that the amount of evidence necessary to establish the content of an oral presentation beyond reasonable doubt was to be judged on a case-by-case basis, i.e. it depends on the quality of the evidence in each case. In the current board's view, decision T. 1212/97 could not be interpreted as setting an absolute standard for the amount of evidence necessary to prove the contents of an oral disclosure. The board considered that there may be circumstances where evidence from the lecturer and only one member of the audience is convincing

enough to reach the standard of proof – i.e. beyond reasonable doubt. In the case at issue, however, evidence from the lecturer and a member of the audience, provided by them in the form of both affidavits and oral testimony, was not considered by the board to prove beyond reasonable doubt that the subject-matter of the claim was disclosed during the lecture. (Both T. 1212/97 and T. 2003/08 were cited in T. 843/15, in which doubts led the board to conclude that a diagram shown in a conference speaker's slideshow had not been made available to the public).

With respect to oral presentations during a conference, the board in T. 667/01 stated that: a declaration of the presenter as to the content of his presentation would not usually be regarded as sufficient since he might have deviated during his presentation from what he intended to present and from what he later remembered as having presented, or he might have presented relevant issues in such a way that the audience was unable to take note of them. If the extent to which the audience understood the presented issues remained uncertain, the established standard of proof typically required a further, independent statement by a person having attended the presentation. Considerable doubt had to remain as to whether the presenter could after 12 years still remember what exactly was presented.

3.2.3 Internet disclosures

a) General

Disclosures on the internet are generally regarded as part of the state of the art within the meaning of Art. 54(2) EPC. Information disclosed on the internet or in online databases is considered to be publicly available as of the date it was publicly posted (Guidelines G-IV, 7.5 – November 2018 version).

The appropriate standard of proof for internet disclosures is the balance of probabilities (T. 286/10, T. 2227/11).

See also chapter III.G.4.2.3 "Archives and internet publications".

b) Public availability of a document stored on the World Wide Web

Both T. 1553/06 and T. 2/09 dealt with the question of the public availability of documents saved on the World Wide Web. These two cases concerned test-cases. These two decisions were taken before T. 286/10 (which established the law now applicable with respect to the standard of proof for internet publications).

In T. 1553/06 the board developed a test for assessing the public availability of a document stored on the World Wide Web which could be found via a public web search engine on the basis of keywords. In devising this test the board started from its finding that the mere theoretical possibility of having access to a means of disclosure did not make it become available to the public within the meaning of Art. 54(2) EPC 1973. What is required, rather, is a practical possibility of having access, i.e. "direct and unambiguous access" to the

means of disclosure for at least one member of the public as set out in G 1/92 (OJ 1993, 277) and T 952/92 (OJ 1995, 755):

If, before the filing or priority date of the patent or patent application, a document stored on the World Wide Web and accessible via a specific URL (1) could be found with the help of a public web search engine by using one or more keywords all related to the essence of the content of that document and (2) remained accessible at that URL for a period of time long enough for a member of the public, i.e. someone under no obligation to keep the content of the document secret, to have direct and unambiguous access to the document, then the document was made available to the public within the meaning of Art. 54(2) EPC 1973.

In T 2/09 the board had doubts as to whether e-mails transmitted over the Internet could be accessed and searched in a way comparable to that of webpages, independent of whether or not access to and disclosure of the content of the e-mail were lawful. The board was rather of the opinion that the differences between webpages and such e-mails make a strong prima facie case against public availability of the latter. The board decided that the content of an e-mail did not become available to the public within the meaning of Art. 54(2) EPC 1973 for the sole reason that the e-mail was transmitted via the internet before the filing date (cf also T 523/14 concerning an advertising newsletter sent by Email – see in this chapter I.C.3.2.1 c).

In T 2284/13 (Wayback machine as prior art) the board accepted a combination of D5, an incomplete archive version of a web page (on the Wayback Machine web.archive.org; publicly available on 2004 with only small images), with D5', a recent download (2009) of the webpage (with full images) as evidence of a prior art publication. Accordingly, when considering the prior art disclosure of D5, also the expanded figure "the MRTT fuel system" shown in D5' had to be regarded as forming part of that disclosure.

c) Publication date

(i) General

The case law on internet publications is chiefly concerned with dating the information found and the applicable standard of proof. The law on this seems now to have been established by the decisions in T 286/10 and T 2227/11, which were endorsed more recently in T 1711/11, T 353/14, T 545/08, T 1589/13 and T 1066/13. Those decisions also cited the EPO practice set out in its notice concerning internet citations (OJ 2009, 456 to 462) and the Guidelines for Examination at the EPO (G-IV, 7.5 – November 2018 version). The appropriate standard of proof for internet citations is the "**balance of probabilities**" and not "beyond reasonable doubt".

The conclusion reached in the earlier decision T 1134/06 (followed by T 19/05 and T 1875/06) that the stricter standard of proof "beyond reasonable doubt" had to be applied to internet disclosures has been refuted. Nevertheless, examining a source's reliability as described in that decision has not become entirely obsolete; see, for instance, T 545/08 (points 15 and 18 of the Reasons), T 353/14 (point 2.2.7 of the Reasons) and T 286/10, in

which the board found that, the Times Union newspaper's www.jacksonville.com was, prima facie, a known and reliable source of information. While the board in [T.2227/11](#) agreed with the detailed reasoning in [T.1134/06](#) that internet citations of prior art entail a number of difficulties in assessing the authenticity of notably the publication date and the content, there was no reason to impose a stricter standard of proof. These difficulties may require some far-reaching investigations into the matter and the provision of supporting evidence.

Observing that documents published on the internet presented a special problem not encountered with conventional publications, in that changes might be made to them over time that were not readily traceable, the board in [T.286/10](#) endorsed the approach taken in [T.2339/09](#) and [T.990/09](#) and applied the principle of free evaluation of evidence as explained in [T.750/94](#) (OJ 1998, 32).

According to [T.545/08](#), it was correctly stated in the Guidelines (G-IV, 7.5.2, unchanged in the November 2018 version) with respect to internet disclosures: "The standard for assessing these circumstances is the balance of probabilities. According to this standard, it is not sufficient that the alleged fact (e.g. the publication date) is merely probable; the examining division must be convinced that it is correct."

The burden of proof generally lies with who asserts. In the specific case of internet citations of prior art cited by the EPO, the burden of proof thus lies with the EPO. If the EPO, however, is satisfied that, on the balance of probabilities, an internet citation constitutes prior art, it is then up to the party to prove otherwise ([T.2227/11](#), [T.1589/13](#), see also on burden of proof [T.545/08](#), points 12 and 13 of the Reasons; [T.1066/13](#), "directory listing").

(ii) Illustrative case law

The facts on which any finding of public availability is based must be established with a sufficient degree of certainty in order to convince the competent organ of the EPO in view of all the relevant evidence that they have indeed occurred. This holds true even if the determination is made on the basis of probabilities and not on the basis of absolute certainty ("beyond any reasonable doubt") ([T.545/08](#), point 11 of the Reasons, applied in [T.1236/13](#) in the context of the date of finding a webpage, as displayed in the URL as a date stamp).

It is well-recognised policy of the Internet Archive's Wayback Machine to crawl the internet and archive crawled web pages using the date and time when the web page was crawled as part of the URL. The board did not see how the URL used by the Wayback Machine for archiving purposes can be considered to be dynamic, as argued by the appellant (applicant), nor did the appellant substantiate this argument any further. The board in [T.523/13](#) was therefore of the view that the date stamp was established with a sufficient degree of certainty (cf. [T.545/08](#), point 11 of the Reasons), unless proven otherwise (ibid., points 12 and 13 of the Reasons).

In [T.286/10](#) (www.jacksonville.com / www.archive.org) the board stated that internet publications presented a special problem compared to conventional publications, given

the potential for making changes that were not easily traceable. Internet publications did not in principle call for a different standard of proof; any uncertainty linked to such disclosures had to be overcome in a way that ensured a sufficient degree of probability and established a presumption of availability that would convince the judge.

In T. 2339/09, according to the search report, D4 was an internet article dated 22 May 2006 and relating to a product catalogue of HBE GmbH, which had been found in an internet archive at www.archive.org on 21 March. The date of the catalogue's online publication was therefore 22 May 2006, i.e. before 17 November 2006, which was the filing date of the application in question. Moreover, the catalogue bore an imprint with the date "11.10.04", which suggested that it had been published "offline" even earlier. In any event, the relevant dates were prior to the filing date and it therefore had to be found that D4 formed part of the state of the art. The board held that the applicant (appellant) bore the burden of presenting the case for and proving the contrary, i.e. that D4 had not been published before the filing date.

In ex parte case T. 1961/13 the board noted that it should not have been necessary for the appellants to investigate the relevance of Google's date indications. It was the task of the examiner to make an objective assessment of what a particular date indication was intended to represent and how reliable it was, and to make further investigations if necessary. If it was not understood how a particular date reported by a search engine was generated, it could not be used as evidence of a publication date. A date reported by Google was inherently unsuitable to serve as evidence of the publication date of a document.

The reliability of the information contained in the extracts of Wikipedia cited by the opponent could not be assessed and/or there was no evidence that the content of those documents was made available to the public before the effective date of filing of the patent. Accordingly, and independently from the question whether or not there was any justification to submit those documents on appeal, those documents could not be used to prove common general knowledge available at the effective date of the patent (T. 378/15).

In T. 1469/10 the board pointed out that the ETSI 3GPP organisation, a reputable standardisation body, had clear and reliable rules for publishing any meeting contributions, in particular as to the documentation of the uploading to the public file server. Therefore, a publication date indicated on the 3GPP document lists ("timestamp") was of high probative value and might serve as prima facie evidence as to the date on which the document was available to the public. Accordingly, the board pointed out that the dates ("timestamps") indicated on the 3GPP document lists corresponded to the dates on which the respective documents were uploaded to the 3GPP file server.

3.2.4 Public prior use

a) General

The state of the art is held to comprise everything made available to the public by means of a written or oral description, **by use**, or in any other way, before the date of filing of the

European patent application (Art. 54(2) EPC). Use can take the form of producing, offering or marketing or otherwise exploiting a product, offering or marketing a process or its application or applying the process. Marketing may be effected, for example, by sale or exchange (see Guidelines G-IV, 7.1 – November 2018 version).

Instances of public prior use or availability in any other way will typically be raised in opposition proceedings. Under established case law (see e.g. T 194/86; T 232/89; T 78/90; T 600/90; T 602/91; T 522/94, OJ 1998, 421; T 927/98; T 805/05), the following has to be clarified to determine whether an invention has been made available to the public by prior use: (i) when the prior use occurred, (ii) what was made available to the public through that use and (iii) the circumstances of the use, i.e. where, how and by whom the subject-matter was made public through that use.

See also: chapters IV.C.2.2.8 d) "Alleged public prior use"; V.A.4.13.6 "Public prior use"; and various sections in chapter III.G. "Law of evidence".

Although prior use is dealt with here in this chapter on novelty, specifically in its section on determining the prior art, it should be borne in mind that, whilst chiefly important in that context, what can be regarded as prior art is also relevant in examining inventive step (for relatively recent examples, see e.g. T 1464/05 – public prior use as closest state of the art; T 23/11; T 2170/12).

Concerning examination by the EPO of its own motion it may be noted that under Art. 114 EPC the EPO has a limited obligation to undertake an examination of its own motion with regard to public prior use. Indeed, in T 129/88 (OJ 1993, 598) the board noted that although a board of appeal had an obligation under Art. 114(1) EPC to investigate matters of its own motion, that obligation did not extend as far as investigating an allegation of public prior use, where the party previously making that allegation had withdrawn from proceedings and it was difficult to establish all the relevant facts without that party's co-operation. The reason for this was that the obligation to investigate of its own motion imposed on the EPO by Art. 114(1) EPC was not unlimited in its scope, but was confined by considerations of reasonableness and expediency. Therefore, if the opponents withdrew the opposition, thereby indicating that they were no longer interested in the outcome of the opposition, then, although the EPO might have the power, depending on the state of residence of relevant witnesses, to compel them to give evidence, either before the EPO or before the court of a contracting state, in the interests of procedural economy it should not normally investigate the issue any further. It would be different if a relevant public prior use had already been substantiated by documents of undisputed authenticity, or if the material facts with respect to the alleged public prior use were undisputed (see T 830/90, OJ 1994, 713; T 887/90, T 634/91, T 252/93 and T 34/94).

b) Public prior use occurred

In T 84/83 a new type of wide-angle mirror had been fitted to a motor vehicle for demonstration purposes for at least six months. The board held this to constitute prior public use as, during such a time, the vehicle could be expected to be parked on public highways and hence open to inspection by third parties.

T.1416/10 concerned the public prior use of a washing machine manufactured and sold by the patent proprietor under model number WD-R100C. The board noted that, although there was no proof on file that the specific washing machine had indeed been available to the public prior to the relevant date of the patent in suit, notwithstanding that it was highly unlikely that this specific machine had remained with the manufacturer for more than one month before being delivered for sale to a distributor, the evidence submitted by the opponent allowed the conclusion to be drawn beyond any reasonable doubt that washing machines with the model number WD-R100C had been publicly available to the distributors for public sale prior to the relevant date of the patent in suit.

In **T.1682/09** the appellant alleged public prior use of an assembly of a weighing system. The board observed that, according to the established case law, the sale of an apparatus is, in the absence of any special circumstance, sufficient to render it available to the public. In the case at issue, the assembly had only been leased; it was not owned by the company. The board however found that mounting the assembly at the company's premises and the subsequent conventional start-up, training and maintenance procedures of the assembly at the same premises had rendered its features available to the company, which had constituted a member of the public at that time.

In **T.2440/12** the invention was a method to be performed by a computer. The board came to the conclusion that prior use of a software product in the form of sales made the method implemented by the software part of the state of the art since, in principle, the skilled person could have executed the software line-by-line on a computer, and, in doing so, would have not only carried out the method, but also gained knowledge of the method steps performed by the computer. The board concurred with the appellant that even a different "disclosure" of the method, as could be obtained by executing it on a computer line-by-line without infringing copyright protection, was sufficient to take away the novelty of the method as claimed. Hence, the subject-matter of claim 1 was not new following the prior use of a software product which undisputedly embodied the claimed subject-matter.

In **T.2210/12**, the appellant (patent proprietor) contended that the installation of machinery on Volkswagen's private factory premises could not result in its having been made publicly available (see, in relation to shipyards, **T.245/88** and **T.901/95**). The board, however, considered it established that the machinery's delivery had not been subject to any duty of confidentiality. Since Volkswagen itself already counted as part of the public, it made no difference whether or not third parties had access to its premises. See also **T.2273/11**.

In **T.1647/15**, in which one of the parties objected to the language the opposition division's chairman had used to silence its representative, the board, having dealt with this objection itself and taken into account how long the proceedings had already lasted, decided not to remit the case to the opposition division and ruled that the alleged prior use (sale of three types of Scheuerle trailer – photographs produced) had been established. As regards the photos, the patent proprietor hinted at the possibility that the trailers might have been modified since the priority date of the patent. However, taking common wisdom into account and considering that the claimed subject-matter referred to the basic design of the trailer, it seemed very unlikely that these very special vehicles had undergone significant design modifications impacting features of the claim.

c) No public prior use

In **T 363/90** a machine fitted with a sheet feeder corresponding to the claimed invention had been exhibited and demonstrated at trade fairs. The board concluded that, under the circumstances, it was impossible for the skilled person to recognise – or to infer on the basis of further information – the technical features and the functions of the exhibited sheet feeder to an extent which would have enabled him to copy its design, let alone develop it further.

In **T 208/88** (OJ 1992, 22) the board held that an effect (in this case, growth regulation) not previously described, but actually occurring during the execution of a known teaching (in this case, use as a fungicide) and intended as the basis of a use invention, had in any event not been made available to the public, if it was not revealed so clearly during such execution as to disclose the invention's essential character, at least potentially, to an unlimited number of skilled persons (cf. **G 6/88**).

In **T 245/88** several vaporisers had been installed in a **fenced-off area** of a shipyard. The public did not have unrestricted access to this area. The board was of the view that the vaporisers had not been made available to the public.

In **T 901/95** the board decided that merely claiming that generating equipment was installed into ships at three different shipyards and thus available to the public was not enough to demonstrate its obvious prior use. Shipyards were normally considered restricted areas and thus not open to the general public. Nor could the possibility be excluded that shipyards' business partners might secure their common interests through explicit or tacit secrecy agreements, in the absence of other protection. In the case in point, it was also questionable whether the relevant process steps and the functional arrangement of the switching means were apparent from merely looking at built-in apparatus; nor was it certain when the generating installations had become operational. The board did not in these circumstances consider the alleged public prior use.

In **T 801/98** the board, having found that an alleged **prior use by sale**, in the form of a delivery of locks to a psychiatric clinic before the contested patent's priority date, had been established, considered that there was insufficient evidence to overcome the doubts as to whether it had been public.

In **T 945/09** (patient – clinical trials) the board found that there had been prior use but it had not been public.

In **T 1410/14** it was common ground between the parties that a vehicle ("City Runner") with the claimed features had been test driven on a route forming part of a town's public transport network on a particular date, but also that the coupling joint in question could have been seen only from above, namely from an overhead pedestrian bridge. For the board, it was not proven that this prior use would have enabled a skilled person to identify all the features of the invention. In particular, the appellant had failed adequately to show that a specific feature (a bracket forming part of the pivot bearing and held displaceably on the coach body) had been apparent to the skilled person during the test drives.

Summing up, the board held that features of subject-matter that had been visible only briefly could be considered to have been made publicly available only if it could be shown beyond doubt that they had been clearly and directly apparent to the skilled person for that short time. In T 1551/14, the patentee relied on T 363/90 and T 1410/14. The board considered that these decisions did not apply to the case in hand

In T 1217/01 an invoice was the only document bearing a date earlier than the contested patent's priority date that had been adduced by the appellant (opponent) in support of an alleged prior use, but it did not disclose the composition of the product sold. The board found that the product's composition could therefore be deduced only by "reverse reasoning", working back from the invoice to the product's production (packaging, mixture, weight, elaboration) and, from there, to the formula used. However, owing especially to changes in product names and numbering, which made it impossible to reconstruct where the cited product fitted into the product family, the board ultimately ruled that the evidence was not conclusive enough.

In case T 1534/16 the appellant (patent proprietor) raised doubts concerning the public availability of the installations in accordance with the alleged prior uses, in particular by referring to the presence of an obligation to maintain secrecy. The board, regarding the appellant's doubts as justified and considering that further investigations would require the co-operation of the opponent, who withdrew its opposition, concluded that the allegations of prior use were to be disregarded.

d) Internal structure or composition of a product

In many cases the ability to recognise a technical teaching such as the internal structure or composition of a product in prior use presupposes analysis of the product embodying this technical teaching. Whether it is technically feasible to analyse a product that is available on the open market is an issue that the boards have considered on a number of occasions.

In T 952/92 (OJ 1995, 755) the board stated that information as to the composition or internal structure of a prior sold product is made available to the public and becomes part of the state of the art if **direct and unambiguous access** to such information is possible by means of known analytical techniques which were available for use by a skilled person before the relevant filing date (see also T 2/09). The board also stated that the likelihood or otherwise of a skilled person analysing such a prior sold product, and the degree of burden (i.e. the amount of work and time involved in carrying out such an analysis), is in principle irrelevant to the determination of what constitutes the state of the art. The novelty of a claimed invention is destroyed by the prior disclosure (by any means) of an embodiment which falls within the claim. The possibility of a complete analysis of a prior sold product is not necessary. The novelty of a claim is destroyed if an analysis of a prior sold product is such as to inform the skilled person of an embodiment of the product which falls within the claim.

In G 1/92 (OJ 1993, 277) the Enlarged Board of Appeal held that the chemical composition of a product forms part of the state of the art when the product as such is available to the

public and can be analysed and reproduced by the skilled person, irrespective of whether or not particular reasons can be identified for analysing the composition. The same principle applies mutatis mutandis to any other product. It also stated that "An essential purpose of any technical teaching is to enable the person skilled in the art to manufacture or use a given product by applying such teaching. Where such teaching results from a product put on the market, the person skilled in the art will have to rely on his general technical knowledge to gather all information enabling him to prepare the said product. Where it is possible for the skilled person to discover the composition or the internal structure of the product and to reproduce it without undue burden, then both the product and its composition or internal structure become state of the art."

In T 472/92 (OJ 1998, 161) the board referred to G 1/92 and concluded that the printability characteristic of the material was not a property that became available to the public by their mere delivery, since this was clearly an extrinsic characteristic requiring interaction with specifically chosen outside conditions. Thus, such characteristic could not be considered as already having been made available to the public (see also T 267/92).

In T 390/88 the board rejected the argument that a film had not been made available to the public because its existence had only been announced at a press conference three weeks before the priority date, and hence it would have been impossible in that short time for a person skilled in the art to determine the film's composition.

In T 301/94 the board decided that the skilled person would have been able to reproduce the green glass without undue burden and that this was sufficient to meet the requirement of reproducibility set out in G 1/92. A skilled person must be able to prepare the product without undue burden on the basis of his general technical knowledge and knowing the composition or internal structure of the product, whatever the scale of production (laboratory, pilot or industrial scale). The board held that when a commercially available product could be analysed by the analytical methods known on the priority date and could also be reproduced, its chemical composition formed part of the state of the art even if a skilled person could not have recognised a priori (i.e. before performing an analysis), on the basis of the common general knowledge on the priority date that at least one component was present in the product, or was present in an "unusual small" amount (referring to T 952/92, OJ 1995, 755; T 406/86 OJ 1989, 302; T 390/88; G 1/92; see also T 370/02).

In T 947/99 the alleged public prior use concerned a visit to an ice-cream factory. Although it had not been established that a feature of the manufacturing process had been explicitly explained to the visitors, the board decided that information about the procedure had been publicly disclosed. The board observed that, in accordance with the principles set out in G 1/92, it was the fact that direct, unlimited and unambiguous access to any particular information regarding the manufacturing processes known per se was possible which made these processes available to the public within the meaning of Art. 54(2) EPC 1973, whether or not there was any reason to look or ask for such information.

In T 969/90 and T 953/90 the board had ruled that the internal structure of a product in prior use had been made available to the public because a skilled person relying on the

normal means of investigation available to him would have been able to analyse the product.

In T 2048/12 the board stated that opinion G 1/92 did not imply that in each and every case the commercial availability of a chemical product as such necessarily amounted to a disclosure of (also) all the impurities contained therein merely because it was possible to identify and quantify these impurities by analytical means. Conclusion 1 of G 1/92 was to be read by attributing a technically reasonable meaning to the technical expression "chemical composition". In the present case there was no direct or indirect pointer to the possible technical relevance of further impurities (besides water) in the commercial product.

In T 2068/15 (chemical composition – analysability), the board considered in the case at issue that the skilled person analysing the film with the techniques known at that time (electron microscopy) would not have overlooked the first top layer. And the board stated also that it was common practice at the priority date of the patent to apply more than one analytical method in order to obtain information about the composition of a material.

In T 1409/16 the board decided that commercial composition only accessible by subjecting said prior art composition to a kind of **reverse engineering** (by fractionation) based on hindsight revealed "extrinsic characteristic" within the meaning of G 1/92 (see also similar case T 834/15).

In T 1452/16 (alleged prior use of Amano lactase) the board stated that in order to assess whether a prior-art product falls within the terms of the claim, one obviously has to assess the claimed parameters, even if these have never been used before. Furthermore, the board explained in detail why the present cases differed from T 946/04, T 1457/09, T 2048/12 and T 2068/15. Contrary to the patent proprietor's arguments, the board noted firstly that T 952/92 did not stipulate that structural assays had to be used, and second that the skilled person did not have to test for all possible impurities. As to reproducibility, T 952/92 also clarified that no complete reproducibility was needed. The board came to the conclusion that the evidence on file convincingly demonstrated that a lactase preparation fulfilling the parameters (given ratio) recited in claim 1 of the main request was publicly available, that an **enzyme** with the characteristics as claimed was commercially available in the prior art and that its use in a process as claimed had also been made available to a member of the public, and hence was state of the art.

In T 461/88 (OJ 1993, 295) the board ruled that a control program stored on a microchip had not been made available to the public if the analysis of the program would require an expenditure of effort on a scale which could only be reckoned in man-years and if, for economic reasons, it was highly improbable that the sole purchaser of the machine controlled by the program had carried out such an analysis (see obiter dictum ruling in T 969/90, see also T 212/99).

T 1833/14 dealt with the **condition of reproducibility** laid down in G 1/92. It could not be concluded that the skilled person was able to reproduce the product Rigidex®P450xHP60 without undue burden. In order to be part of the prior art pursuant to Art. 54(2) EPC, a

public prior use must amount to an enabling disclosure (T. 977/93, OJ 2001, 84; T. 370/02, T. 2045/09, T. 23/11 and T. 301/94). It is generally known in the field of polymers that the **nature of the catalyst system**, the type of reacting system and the process conditions significantly affect the properties of the produced polymer. In the polymer field, in which products and compositions are often defined by means of parameters, the requirements of sufficiency of disclosure is analysed with particular care and the same criteria must apply to the reproducibility without undue burden of a product on the market. In order for the product to be state of the art, the question was whether or not the skilled person would have been in a position to prepare the product as such, i.e. a sample identical to Rigidex®P450xHP60 in all its properties (not only those specified in claim 1). This was however not shown by the appellant (opponent). To the contrary, the appellant stated that "what may be more difficult (if the catalyst used for the original product is not known) is obtaining the same mechanical properties as the Rigidex product". T. 1833/14 cited by T. 842/14 in connection with Art. 83 EPC.

The board in T. 1217/01 found that, since the perming product allegedly in prior use was a fast-moving consumer good, it could be presumed that it had gone on sale, and so been publicly available, soon after payment of the invoice the appellant (opponent) had adduced as supporting evidence. For the board, the case turned on the composition of the oxidising agent (fixer) in the invoiced product. But, as no product or even packaging dating from the time was available, its exact composition could be deduced only by "**reverse reasoning**", working back from the process of its elaboration and production. The board ultimately found that the evidence was not conclusive enough; owing especially to changes in the product names and numbers, it had not been shown that the sold product had also been made of the claimed composition.

3.2.5 Biological material

In the field of microbiology, the board, in T. 576/91, conceded that an unwritten rule may exist within the scientific community, whereby biological material referred to in a scientific publication can be freely exchanged. However, this does not amount to an obligation, so that any biological material which is the subject of a publication can be considered as being publicly available. The board further stated that if contractual obligations between parties resulted in access to biological material being deliberately restricted to a group of persons bound either by a research contract or a licence, it could not be concluded that this material had been made "available to the public" within the meaning of Art. 54(2) EPC 1973 (see also T. 351/98). In T. 128/92 the board stated that, for a complex biochemical to be made available to the public, the minimum that would seem to be required for publication was a notice to those in the field that samples of the biochemical could be obtained on request, and clear evidence of exactly what the biochemical was.

3.3. The concept of "the public"

The boards considered the concept of "the public" in several decisions. According to their case law, information is generally to be regarded as having been made public if even just one single member of the public is in a position to gain access to it and understand it, and

if there is no obligation to maintain secrecy (T.1081/01, T.229/06, T.1510/06, T.1309/07, T.2/09, T.834/09, T.1168/09, T.239/16).

In T.1829/06 the board stated that, according to established jurisprudence, information was considered to be made available to the public even if only one member of the public had access to it and there was no bar of confidentiality restricting the use or dissemination of such information. The fact that this member of the public acted as a straw man or that the opponent itself could have had difficulties in obtaining the article was immaterial.

3.3.1 Sale to a single customer

According to the established legal practice a single sale was sufficient to render the article sold available to the public within the meaning of Art. 54(2) EPC 1973 provided the buyer was not bound by an obligation to maintain secrecy. It was not necessary to prove that others also had knowledge of the relevant article (T.482/89, OJ 1992, 646, see also T.327/91, T.462/91, T.301/94 and T.783/12).

The sale of an object to a single customer who is not obliged to maintain secrecy renders the invention public, even where the object is to be used in a **prototype**, which is itself to be kept confidential until it is mass-produced (T.1022/99).

If a product can be analysed, its composition also becomes public on its sale to a third party (T.897/07).

3.3.2 Making available to a person not skilled in the art

In T.953/90 and T.969/90 the boards pointed out that information has been made public even if the sale was made to a person not skilled in the art.

In T.809/95 the patentee justified its position on non-disclosure essentially on the ground that the test persons were not skilled in the art. It cited T.877/90. The board noted that the latter decision dealt with information made public by oral disclosure at a lecture. Public disclosure was there linked to the condition that the audience had to include skilled persons capable of understanding the lecture. Such considerations seem appropriate to an oral disclosure but are not transferable to the case of information made public by making an article available for free use.

3.3.3 A limited circle of people

According to the case law of the boards of appeal the information is publicly available where it was made available to a limited circle of people (T.877/90 – congress; T.228/91 – course; T.292/93 – demonstration for potential customers conducted on the premises of a company with close links to the opponent). Whether or not a member of the public has actually accessed the information is irrelevant (see T.84/83). In T.877/90 an oral disclosure was regarded as made available to the public if, at the relevant date, it was possible for members of the public to gain knowledge of the content of the disclosure and there was

no bar of confidentiality restricting the use or dissemination of such knowledge was (see also T.300/86 on a written description and T.443/09 on public prior use).

According to T.165/96 which concerned the public availability of technical information drafted in Danish and disclosed in an insert in a minor small-ads newspaper (circulation: 24,000) distributed in the suburbs of Copenhagen, the "public" within the meaning of Art. 54(2) EPC 1973 did not presuppose a minimum number of people or specific language skills or educational qualifications. It followed that the residents of a Copenhagen suburb were held to represent the public.

In T.1085/92 the board ruled that a company's own staff could not normally be equated with "the public" within the meaning of Art. 54(2) EPC 1973 (see also T.1464/05, T.1057/09).

In T.1081/01 the board observed that if, at the time of receipt of the information, the recipient was in **some special relationship to the donor** of the information, he could not be treated as a member of the public, and the information could not be regarded as published for the purpose of Art. 54 EPC 1973. Even if this special relationship were later to cease, so that the recipient was now free to pass on the information, the mere cessation of the special relationship did not make the information available to anyone else (see also T.1057/09, with respect to a diploma thesis).

In T.398/90 a marine engine installed in a ship was held to have been known to the engine room crew and hence to have been made available to the public.

In T.313/05 the respondents asserted that document D30 had been made available to the public at an international workshop. The board came to the conclusion that the public availability of document D30 before the priority date of the patent in suit could only be regarded as established if, in view of the evidence, it had no reasonable doubt in this respect. This requirement was not met (see also T.1335/05).

3.3.4 Public library

In T.834/09 the board stated that the person in charge of the reception and date stamping of an incoming document at a public library is without any doubt a member of the public as this staff member is in no way bound by any obligation to maintain secrecy about the publications he/she handles and the content thereof, and after all, his/her very function as a staff member of a public library is to make information available to the public. The board went on to state that in the case of a written disclosure it is irrelevant whether the staff member is a person skilled in the art or not, because the content of a written disclosure can be freely reproduced and distributed even without understanding it. Thus the board held that the reception and date stamping of an incoming document by a staff member of a public library makes the document available to the public.

In T.314/99 it was undisputed that the **diploma thesis** arrived in the archive of the Chemistry Department Library of the University of Hamburg before the priority date. However, in the board's judgment, the diploma thesis did not by its mere arrival in the

archive become publicly available, since that did not mean it was as of that point in time catalogued or otherwise prepared for the public to acquire knowledge of it, and because without such means of information the public would remain unaware of its existence.

In T.1137/97 the board stated that the strength of the presumption in favour of the accuracy of a "Received" date marking appearing on the copy of a journal in a library as evidence of the actual date when the journal was made available to the public would depend on the library routine used. The board did not accept a handwritten date on the cover of a journal in view of other evidence.

In T.729/91 one relevant document was an issue of a periodical intended for hoteliers and caterers. In accordance with the evidence brought forward in the case, a copy of this periodical was received by a particular library, i.e. before the priority date of the patent in suit. The librarian stated that publications were "generally available to the public as of the date of receipt". In the present case, it was, in the board's view, likely that the publication was available as from the date of receipt.

In T.1050/12 the question of availability to the public of meeting **abstracts of presentations for a future conference** published in a supplement to a regular volume of a scientific journal was disputed. There was corroborating evidence in the form of date-stamped copies for the dates of receipt and/or cataloguing, and the board had no reason to doubt the usual routines described by librarians in their declarations. On the contrary there was no evidence on file supporting the allegations of the respondent (patent proprietor) that the journal supplement was not to be disseminated freely. The board did not agree that the conclusions of T.834/09 contradicted the earlier jurisprudence and refused the respondent's request for referral to the Enlarged Board. The board considered that, regardless of whether or not the librarian is considered a member of the public (as was the issue in decision T.834/09), there was persuasive evidence that documents at issue were made available to the public before the priority date of the present patent.

3.4. Obligation to maintain secrecy

3.4.1 General

If the person who was able to gain knowledge of the invention was under an obligation to maintain secrecy, the invention cannot be said to have been made available to the public, provided the person did not breach that obligation. If the obligation to maintain secrecy stems from an **express** agreement that has been observed, the information has not been made available to the public. Less clear cut are cases of **tacit** secrecy agreements. Whether a tacit secrecy agreement between parties exists, depends on the peculiar circumstances of the specific case (T.1081/01, T.972/02, T.1511/06), e.g. the commercial inter-relationship between and the commercial interests of the companies involved (T.913/01; see also T.830/90, OJ 1994, 713, T.782/92, T.37/98).

In T.1081/01 the board held that information provided subject to a confidentiality agreement did not become available to the public merely by reason of the expiry of the obligation to keep it confidential. Some separate act of making it available to the public

would be needed. This conclusion was in agreement with the conclusion reached in T. 842/91, where permission to publish a text was considered merely as permission to make the text available to the public, and not as actually making the text available to the public. In T. 833/99 the board observed that there was no law to the effect that the confidentiality governing tender procedures ends when they do.

It is settled case law that – in the absence of any special circumstances – the sale of a device suffices to make it publicly available. What is often at issue here is whether there was any obligation to keep the device in prior use secret.

3.4.2 Parts for serial production

In T. 1168/09 two prior uses were alleged: the supply of 170 ESG 400 control units and the supply of 111 143 ESG 300/600 control units. No information had been submitted with regard to the conditions of supply and, in particular, as to whether or not confidentiality had been agreed. The board therefore investigated whether, in the light of the business relationship between the supplier and the customer, it had to be presumed that an obligation to maintain secrecy had been tacitly agreed. A tacit obligation to maintain secrecy could be presumed, for instance, where business partners had a shared interest in confidentiality. However, such an interest could only be presumed until the parts had been supplied for serial production because, from then on, the parts were destined to be fitted in cars for sale and so made available to the public. In other words, a shared interest in confidentiality could no longer be presumed once parts had been delivered for serial production (see T. 1512/06). In the case at hand, the board found that the large number of control units supplied suggested that they had not been test units. It therefore held that they had been publicly available.

In T. 1309/07 the board ruled that it was clear from the file that 17 520 combustion-engine pistons of a certain type had been supplied to Renault before the priority date. The question was whether, at the time of delivery, a tacit secrecy agreement had applied. In view of the large quantity involved, and the fact that pistons of this type were offered in a pre-published spare-parts catalogue, the board took the view that they had been supplied not for test purposes but for normal series production, so from that point onwards no such agreement could have existed.

3.4.3 Distribution of prospectuses, technical descriptions

In T. 173/83 (OJ 1987, 465) and T. 958/91 the board held that a technical description sent out to clients could not be regarded as secret information.

The board in T. 2056/13 held, in relation to an operating manual with a **copyright notice**, that such notices did not normally imply an obligation to maintain secrecy. That there had been none in this particular case was anyway clear from the manual itself, which mentioned the possibility of its sale and dissemination and was therefore prior art for the purposes of Art. 54(2) EPC. (Argument of the opponent that copyright protection does not necessarily imply that the content is confidential rejected by the board in the circumstances of the case T. 1570/14 – a joint development project.)

3.4.4 Commercial inter-relationships and interests

In the following cases, the boards found that there was an (implicit) obligation to maintain secrecy:

In T.1085/92 the board took the view that, where contractual relations and development agreements existed, a secrecy agreement could be assumed to exist.

In T.838/97 the board held that an agreement which ruled out availability to the public did not necessarily have to be a contract made in writing, as an implicit or implied agreement could also be taken into account (see e.g. T.818/93).

In T.830/90 (OJ 1994, 713) the board, faced with the facts of the case, took the view that a confidentiality agreement had – at least implicitly – been reached. This was perfectly sufficient. Furthermore, in line with general experience, it had to be assumed that such an agreement would be observed at least as long as there was a common concern for secrecy. Such concern would last at least for the period required to safeguard the interests of the business partners.

In T.201/13 the board concluded that the evidence adduced had been covered by at least an implicit confidentiality clause, based on a thorough examination of email correspondence, the outcome of which had been corroborated by witnesses, and a consideration of the length of the business relationship between the firms involved. However, the (continued) existence of an implicit non-disclosure agreement in the time between the patent's priority date (20 February 2004) and the emails sent in late January 2007 was in keeping with **normal business practice**. The board could see no conclusive evidence to the contrary.

In T.799/91 the opponents asserted that the subject-matter claimed had been in prior public use in that its manufacture had been "sub-contracted out" to a third company. According to the board the third company was not simply any third party because the opponents' decision to place an order was based on a relationship of trust. The board therefore saw no indication of there having been prior public use, nor could the claim have been substantiated by the testimony of any witness.

In T.2/09 the board took the view that, where a party's own interest in secrecy could be established, then the situation would be analogous to that of a non-disclosure agreement between the parties involved.

In T.1829/12 it was not in dispute that an explicit non-disclosure agreement had been entered into, but the appellant (opponent) contended that it had been of limited scope and had not covered the sensor unit at issue. The board rejected its contention as being at odds with normal business practice. No convincing reasons had been put forward as to why the sensor unit, of all things, should not have been covered by the explicit non-disclosure agreement.

In T. 2170/12, in which the public availability of a project report was in dispute, the opponent had produced a statement by one of the report's authors that there had been no confidentiality obligation restricting the use or dissemination of any project information. The board, however, found that the report appeared to have been circulated only among people working on the project (which, the proprietor maintained, implied its confidentiality). It did not seem to have been sent to a wide circle and there was no specific evidence to support what the author had said in his statement. Considering also the short interval in question (less than four months), the board held that the report's public availability during this time had not been sufficiently proven and ultimately disregarded it as prior art for the purposes of examining inventive step.

In T. 833/99, during invitations to tender, the municipal employees had been required to observe confidentiality. The appellant (opponent) said they might have breached that confidentiality, e.g. by informing repair workers of certain steps in the process, but did not back this up with firm facts such as dates, circumstances, etc., or with other evidence. Mere suppositions could not be entertained; they were not proof, and the onus was on the appellant to show that its allegations were well founded. Lastly, the board observed that there was no law to the effect that the confidentiality governing tender procedures ends when they do.

Finally, contrasting with the above, a particular example of the absence of an implied obligation of confidentiality in case T. 1798/14 took the form of a witness's visit to a firm's premises. It was in dispute whether he had been subject to an obligation to maintain secrecy, something he had repeatedly denied in his testimony. The respondent (patent proprietor) argued that he might nonetheless have been under such an obligation without knowing it. The board observed that it was not normally possible to furnish positive proof of the **non-existence of a fact** (here, an obligation). However, the non-existence of an agreement could instead be proven by showing that those who ought to have been informed were unaware of it. The business relationship between the witness and the company in question concerned a technical field that was not related to the said site visit. The board concluded that there had been no tacitly agreed obligation.

3.4.5 Demonstrating products for presentation purposes

In T. 634/91 the claimed prior public use consisted of the presentation of a circular saw at an opponent's place of business during a meeting between the patent proprietor and a potential buyer. Without elucidating further, but referring to the decision in T. 830/90 (OJ 1994, 713), the board held that such talks constituted a tacit understanding to maintain secrecy.

In case T. 478/99 a demonstration was made by two potential clients. It could not be proven that a confidentiality agreement existed. The board held that the sole absence of an explicit request for confidentiality was not sufficient to conclude that there was no confidentiality, because secrecy may result from an ethical code of conduct for the employees of big companies such as the two clients in question. Consequently, the board considered the alleged public prior use not to be proven.

In T. 823/93 of 18 October 1996, according to the board, the development of a new apparatus is usually kept secret from competitors. In the case at issue, the development of the apparatus had to be regarded as the result of co-operation between the opponent and the client. The board therefore took the view that, on the basis of these facts, it could be assumed that none of the parties had an interest in disclosing any information about the apparatus and it was likely that the technical reports exchanged between the parties were tacitly required to be treated as confidential. The board also held that the general conditions of business, which had become the conditions of contract and required the plans, designs and other documents to be handled confidentially, also extended to verbal information and details given during the presentation of the apparatus.

In T. 292/93 the board ruled that a demonstration conducted for a small group of potential customers on the premises of a company with close links to the opponent was inconsistent with the existence of an obligation to maintain secrecy.

3.4.6 Presenting the product in writing

In T. 541/92 a sub-contractor had given sketches of a device to its client. In the board's view this constituted an obligation to maintain secrecy. It was standard practice for clients and their subcontractors to keep their projects secret, and allegations to the contrary required convincing proof. Likewise in T. 887/90 the obligation to maintain secrecy was derived from the circumstances.

In T. 1076/93 the opponents had, without there having been an explicit agreement to maintain secrecy, had offered an apparatus which caused the subject-matter of the invention to lack novelty and had provided drawings to a weapons manufacturer. The board held that the prior use did not cause lack of novelty, because a variety of circumstances pointed to there having been an obligation to maintain secrecy. According to the board, discretion was generally acknowledged to be the rule on the premises of such companies.

In T. 818/93 several steps and approaches had been taken within the context of business relationships which were necessary to bring the project to a successful conclusion. The board held that such negotiations were confidential by nature, in view of the comparable interests of the parties involved, and implied a secrecy agreement.

In T. 480/95 the document relied upon by the opposition division as a prepublication decisive for the evaluation of inventive step was a letter from the opponent to a customer written in connection with a contractual relationship between the two firms. The board considered this letter to be a typical example of correspondence between contracting firms, which was confidential by its very nature.

3.4.7 Making samples/products available for test purposes

In the following cases, the boards found that there was an obligation to maintain secrecy:

A product made available for test purposes is to be treated as confidential. Sale of the product in a limited quantity is regarded as sale for test purposes, if the product is normally sold in large quantities (see T 221/91, T 267/91 and T 782/92). In T 221/91, the board held that it was for the patent proprietors to prove the existence of an obligation to maintain secrecy when the opponents had proved that the invention had been made available to the public and the patent proprietors had claimed the existence of a secrecy agreement (see also T 1407/09).

In T 37/98 a limited quantity of tape laminates had been delivered to three customers of the appellant. The delivered material had been used exclusively for test purposes, even after the priority date of the patent in suit. This was confirmed by the fact that such a laminate was usually delivered in large quantities. The board concluded that the delivered material had to be treated as confidential. In a case where only test specimens were sent to a customer, it had to be assumed in principle that at least an inherent secrecy agreement existed. If this should exceptionally not be true, the exception from the usual practice had to be proved. The mere statement that there was no secrecy agreement, as made in the present case, was not sufficient for this purpose.

According to the board in T 1847/12, the relationship between a firm and another that it contracted to develop and deliver prototypes could not be treated as equivalent to that between a dealer and a customer. General experience showed that a vehicle became publicly available when the manufacturer delivered it to a dealer, because then anyone could buy it. But the same did not go for a delivery under a development contract. The development itself takes place in a confidential way. The board on this occasion made some observations on the status of third party. The board found that the written statement made by an employee of the contractor (Schrack GmbH) that, "as far as [he] knew", the prototypes had been delivered to the client (Opel) without any duty to maintain confidentiality was irrelevant because it was the client placing a contract, not the contractor, that decided whether confidentiality applied, i.e. here it had been for Opel, as client, not Schrack, as contractor, to decide whether the prototypes' development was to be treated as secret.

There was no obligation to maintain secrecy in the following cases:

In T 7/07 a third party had claimed inter alia that the main claims of the patent lacked novelty over a prior use, namely, the conduct of **clinical trials** with contraceptives containing the composition claimed in the patent. The participants had been informed of the ingredients but had not signed a confidentiality agreement, and not all unused drugs had been returned. The board came to the conclusion that the handing out of the drugs to the participants rendered them publicly available and that it was possible for the skilled person to discover the composition or the internal structure of the product used in the clinical trials and to reproduce it without undue burden.

In **T. 945/09** the teaching according to claim 1 of the patent in suit was used by a patient while having "home parenteral nutrition" (HPN). The opposition division had concluded that all information concerning the use of taurolidine as a catheter lock available to the acting medical team, to the patent proprietor (supplier of taurolidine) and to the patient, was covered by an implicit obligation of confidentiality which stemmed from the specific circumstances of the case. The board held that there was no reason for the patient to treat that knowledge as a secret, because at that time the acting doctors simply tried to apply taurolidine of whatever provenance using a technique they derived freely and easily from the state of the art common to them at that time.

In **T. 602/91**, in the board's view, there had been no tacit agreement, as the two parties had not concluded a development agreement or entered into any other contractual relations that would indicate either of them having had any particular interest in a secrecy agreement. Furthermore, a single case of co-operation between a manufacturer and a potential end-user of the product was not sufficient to assume that a tacit confidentiality agreement had been entered into.

In case **T. 809/95** the granted patent was, inter alia, for a plastic bottle, the special features of which related to its foldability. The prior use alleged by the opponents had occurred in connection with a "market test" performed by a market research company on behalf of the third party to gauge the market for such bottles. The patent proprietor claimed that both prior uses had been subject to confidentiality rules. The board held that the very fact that the third party had chosen a test variant allowing the test participants to take the bottles home indicated that it attached no particular value to confidentiality in the patent sense. Nor was there any circumstantial obligation to maintain secrecy since the market research institute did not employ or have a business relationship with the test persons.

In **T. 1464/05** the board considered that the mere fact that a product has been delivered possibly for carrying out tests in what appears to be the result of an ordinary commercial transaction does not constitute by itself, in the absence of any other special circumstance or supporting evidence, a sufficient condition for concluding that the product was necessarily delivered under an implicit confidentiality agreement (see in this respect decisions **T. 602/91**, **T. 264/99**, **T. 913/01**, **T. 407/03**, and **T. 1510/06**). There was no indication that any express secrecy agreement existed between the two companies, but also no indication that any particular or special relationship existed between the two companies other than the ordinary relationship between a seller and a buyer company. As held in decision **T. 681/01**, "there must be something in the circumstances that suggests that a confidential relation existed before a delivery which appears to be the result of an ordinary commercial transaction can be disregarded as not making the delivered goods available to a member of the public".

In **T. 1054/92 of 20 June 1996** the opponent had alleged and proved that the claimed invention, an absorbent structure for diapers, had been tested in public tests carried out by several hundred members of the public at several places in the USA over several weeks. The board was convinced in the light of common experience that it was very unlikely that these tests had been kept confidential, particularly since some of the used diapers had not been returned to the appellants.

In T.2068/15 the board accepted that that, if joint development projects are agreed, they often are – explicitly or implicitly – combined with an obligation of confidentiality. In the case at hand, the board did however not see enough indications from which it could be convincingly concluded that a joint development project existed. The circumstances were suggestive of ordinary sales rather than the sending of samples in the framework of a joint development project.

3.4.8 Conferences

In T.739/92 an oral description of the invention had been given in a conference. The question was whether the participants at this conference were bound to secrecy and could therefore not be seen as constituting "the public" within the meaning of Art. 54(2) EPC 1973. The list of participants showed that the conference was open to every specialist active in the relevant field. The participants were not prohibited from disseminating oral information from the conference, or from publishing information from it provided that they omitted any reference to the conference. Recording the lectures on tape, etc. and photographing slide material were prohibited. The board held that under these conditions the participants at this conference were to be regarded as normal members of the public since there was no secrecy agreement. In contrast to the situation in T.300/86, the participants were neither licensees of the organisers nor subject to a blanket contractual prohibition from communicating the information they obtained to third parties.

In T.838/97 the invention was presented orally at a conference attended by about 100 of the most renowned experts in the respective technical field including potential rivals. The participants were explicitly instructed that information presented at the conference was not to be used without the specific authorisation of the individual who made the contribution. The board considered that the participants were bound by a confidentiality agreement and thus the invention was not to be considered to form part of the state of the art.

3.4.9 Public availability of documents submitted for standardisation

In T.202/97 the board held that a draft standard sent together with an agenda to the members of an international standards working party as part of the preparations for a meeting on standards was not normally confidential and was thus available to the public. Even though only a particular group of persons had been invited to take part in the meeting on standards, it was the task of a standards committee to draw up, with the experts in the field, proposals for standards which had been agreed upon, on as broad a basis as possible, and which were based on the current state of developments. This task precluded any obligation to maintain confidentiality.

In ex parte case T.1440/09 the appellant did not contest that D1 had been on the internet before the earliest priority date of the application. D1 was a contribution submitted to the Joint Video Team (JVT) for its 15th meeting in Busan, KR, which took place from several months before the earliest priority date. Furthermore, the board noted that none of the documents on file indicated that contributions to JVT meetings were to be kept confidential even after the meeting in question. The appellant alleged however the confidential nature

of D1 based on the understanding that one of the purposes of the "JVT Patent Disclosure Form" was to protect the submitter from its contribution to the JVT meeting being held against its own later patent application. The board stated that the standard, preprinted "JVT Patent Disclosure Form" did not comprise any explicit indication that the technical contribution of the paper it accompanied should be kept confidential. The mere fact that the submitter of contribution D1 might have ticked the box that it was "not aware of any granted, pending or planned patents associated with the technical content of the Recommendation | Standard or Contribution" in point 2.0 of said form did not imply that the contribution D1 was to be kept confidential by any person to whom it was available. The board found that D1 constituted prior art under Art. 54(2) EPC 1973 for the application in the case in hand.

T. 738/04 concerned standards institutes too, but confidentiality was in the end not decisive; it is mentioned here because it deals with these institutes' practices.

This question also arises in the context of Art. 83 EPC (see T. 1155/12, T. 1049/11).

3.4.10 Joint venture and other commercial agreements

In T. 472/92 (OJ 1998, 161) the board ruled that the existence of a joint venture agreement implied an obligation to maintain secrecy. It was found that an existing joint venture agreement would normally include an explicit or implicit confidentiality obligation between the common daughter and its parents.

In T. 633/97 the opponent had to prove that an alleged prior use had in fact been made public, i.e. there was no obligation to maintain secrecy between the respective contractors. The board stated that, depending on the nature of the business relations and the status of the companies involved, the existence of such an obligation might be assumed on a prima facie basis without the necessity of a written agreement. In the case at issue, LLNL was acting in the national interest of the United States of America in fields which had to be considered classified. The very nature of this project, i.e. uranium enrichment technology, led to the conclusion that all persons involved had to be bound to secrecy.

Similarly, in decision T. 1076/93, the board considered a weapons manufacturer normally not to form part of the public but to be implicitly supposed by its contractors to behave as if an agreement of secrecy had been specified (see also T. 1619/06).

In T. 163/03 the appellant (opponent) contended that the technical details of the apparatus as shown in the drawing D2 became state of the art when this drawing was given, without any confidentiality restriction, to BMW in May 1990, i.e. before the priority date of the patent in suit. The board held that where, as there, the terms and conditions of a technical cooperation, including related obligations of secrecy, had been explicitly specified and agreed upon by the partners of the cooperation by way of a written contract, the contractual provisions prevailed and left no room for construing implicit obligations of the parties which differed from or were incompatible with anything which the partners, on proper interpretation of the contract, had fixed therein. The board found that there was no reason whatsoever to assume, in the absence of any explicit secrecy obligation, that BMW could

nevertheless have been under an implicit obligation to keep secret the manufacturing technology disclosed to it by the opponent within the framework of the SE project.

3.4.11 Paper submitted to obtain an academic degree

In T.151/99 the board held that, in general, it appeared highly plausible that a paper submitted to obtain an academic degree (in this case a master's thesis) was not confidential, and that became a virtual certainty if the paper was referred to in published scientific work. If the reference was in a document published before the priority date of the patent in suit, it could be assumed that the paper had also been made available to the public before that date (see also T.451/00, T.538/09).

3.4.12 Medical field

In T.906/01 the alleged public prior use concerned the implantation of a correction device into a patient. There remained some doubt as to the I. Spinal System which was really implanted. The board considered that a device having an investigational status, being implanted and tested within the restricted area of a hospital, under the responsibility of a surgeon operating within the framework of an investigator's agreement which included a confidentiality clause, had to be regarded as a prototype device. Usually the development and test phases of such products or devices were necessarily surrounded by secrecy as long as said products or devices had not been approved and commercialised (see also T.818/93). The board followed the reasoning of T.152/03 that, in this field, there was a prima facie assumption that any person involved in a medical process was obliged to maintain confidentiality, given the need for patient confidentiality and the need to protect the development and testing of prototype devices, and that any evidence proving the contrary was important and had to be produced as soon as possible.

Decision T.239/16 dealt with the availability to the public of **clinical trials documents**. The board came to the conclusion that the contents of document (55) had been made available to persons neither being bound by any confidentiality agreement nor being in a special relationship to the study sponsor. However, document (55) did not directly and unambiguously disclose the effective treatment of osteoporosis as defined in the independent claims of the main request.

The sale of a product for a commercial purpose is not compatible with the concept of an implied obligation to maintain confidentiality. The board in T.505/15 noted that T.152/03 and T.906/01 referred to a prima facie assumption that any person involved in the medical process was obliged to maintain confidentiality, given the need for patient confidentiality and the need to protect the development and testing of prototype devices. T.505/15 differed in that the prior use occurred in a commercial context. The board concluded that there was no obligation to maintain confidentiality.

3.4.13 Notary

In T.1553/06 the board stated that the notary was not a member of the public. As the board considered that the notary was not entitled to disclose the content of the document at

issue, the question whether the notary had the technical knowledge to understand that content is of no relevance.

3.5. Evidence

3.5.1 Burden of proof

Where lack of novelty is alleged, the burden of proof lies with the party claiming that the information in question was made available to the public before the relevant date (see, for example T 193/84; T 73/86; T 162/87; T 293/87; T 381/87, OJ 1990, 213; T 245/88 and T 82/90). According to the boards' established case law, each of the parties to the proceedings bears the burden of proof for the facts it alleges. If a party, whose arguments rest on these alleged facts, does not discharge its burden of proof, this is to the detriment of that party, who may not shift the onus of proof onto the other party (see T 270/90, OJ 1993, 725; T 355/97; T 836/02; T 176/04; T 175/09; T 443/09).

3.5.2 Standard of proof

a) General

The boards of appeal have developed in their case law certain principles as to the standard of proof required to establish the facts on which a decision is to be based. In some decisions the boards of appeal have applied the standard of "the balance of probabilities", which means that in relation to, for example, the question of when a document was first made available to the public, the board must decide what is more likely than not to have happened (see T 381/87, OJ 1990, 213; T 296/93, OJ 1995, 627; and T 729/91 of 21 November 1994). In other decisions the boards have taken the view that a fact has to be proved "beyond reasonable doubt" or "up to the hilt" (see T 472/92, OJ 1998, 161; T 97/94, OJ 1998, 467; T 750/94, OJ 1998, 32). More recent decisions dealing with the implications in practice of applying these two different standards of proof are T 2451/13 (for "up to the hilt") and T 545/08 (for "balance of probabilities"). See also T 842/14 (novelty and standard of proof).

b) Public prior use

As far the standard of proof to be applied is concerned, the boards' established legal practice is to apply as a rule the same standard of proof to prior public use objections as to other objections under Art. 100 EPC: the balance of probabilities. In cases of prior public use for which the evidence lies entirely within the sphere of the opponent the higher standard of proof "beyond any reasonable doubt" (also called in English "up to the hilt") applies (see T 472/92, OJ 1998, 161, and chapter III.G.4.3.2 "Public prior use" for more details of the case law in this area and on the implications of the "up to the hilt" standard of proof; on this latter point see e.g. T 2451/13).

c) Internet – proof of the date of availability

The law on this seems now to have been established by the decisions in T 286/10 and T 2227/11, which were endorsed more recently in T 1711/11, T 353/14, T 545/08 and T 1589/13. Those decisions also cited the EPO practice set out in its notice concerning internet citations (OJ 2009, 456 to 462) and the Guidelines for Examination at the EPO (G-IV, 7.5 – (unchanged in) November 2018 version): When an internet document is cited against an application or patent, the same facts are to be established as for any other piece of evidence, including standard paper publications. This evaluation is made according to the principle of "free evaluation of evidence". That means that each piece of evidence is given an appropriate weight according to its probative value, which is evaluated in view of the particular circumstances of each case. The standard for assessing these circumstances is the balance of probabilities. According to this standard, it is not sufficient that the alleged fact (e.g. the publication date) is merely probable; the examining division must be convinced that it is correct.

In short, the appropriate standard of proof for internet citations is the **"balance of probabilities"**.

The conclusion of the earlier decision T 1134/06 that the stricter standard of proof "beyond reasonable doubt" had to be applied to internet disclosures has been refuted.

For further information, see in this chapter I.C.3.2.3 "Internet disclosures" and in chapter III.G.4.2.3 "Archives and internet publications".

4. Determining the content of the relevant prior art

After establishing what information forms part of the state of the art, the next step is to determine its technical content and whether that content is apparent.

The consistent view in the case law is that for an invention to lack novelty, its subject-matter must be clearly and directly derivable from the prior art (see e.g. T 465/92, OJ 1996, 32; T 511/92) and all its features – not just the essential ones – must be known from the prior art (T 411/98). The disclosure of a publication is determined by what knowledge and understanding can and may be expected of the average skilled person in the technical field in question (T 164/92, OJ 1995, 305, Corr. 387; T 582/93).

4.1. General rules of interpretation

Determining the information content means interpreting what comprises the state of the art. The boards have established certain principles to be observed in this process.

According to the boards' settled case law, the technical disclosure in a prior art document must be considered as a whole (see T 56/87, OJ 1990, 188). The individual sections of a document cannot be considered in isolation from the others but must be seen in their overall context (T 312/94, T 452/05, T 456/10). In T 1321/04 the board found that the terms used in patent documents should be given their normal meaning in the relevant art, unless

the description gave the terms a special meaning. The patent document might be its own dictionary (**T 523/00**, **T 311/93**). Thus, if a special meaning could be derived from the patent document, only this meaning was ultimately decisive.

In **T 312/94** the board held that for the interpretation of any document, in particular a patent application or patent, in order to determine its true meaning and thus its content and disclosure, no part of such a document should be construed in isolation from the remainder of the document: on the contrary, each part of such a document had to be construed in the **context of the contents of the document as a whole**. Thus, even though a part of a document appeared to have a particular meaning when interpreted literally and in isolation from the remainder of the document, the true meaning of that part of the document could be different having regard to the remainder of the document (see also **T 546/07**, **T 860/06**, **T 456/10**).

According to established case law, it is a prerequisite for the acceptance of lack of novelty that the claimed subject-matter is "directly and unambiguously derivable from the prior art". In other words, it has to be "beyond doubt – not merely probable – that the claimed subject-matter was directly and unambiguously disclosed in a patent document" (**T 450/89**, **T 677/91**, **T 988/95**, **T 1029/96**, **T 218/00**). This also means that the novelty of the claimed subject-matter over a prior art document cannot be opposed only on the basis of equivalents to the features directly and unambiguously disclosed in the cited document (**T 167/84**, OJ 1987, 369; **T 928/93**, **T 1387/06**).

In **T 2201/10** the board found that the "photographic" approach to assessing novelty developed in the case law required that the prior art actually disclose the claimed features, be it explicitly or implicitly, in order for it to be found that the claimed subject-matter lacked novelty. The mere fact that information in the prior art did not rule out the feature in question was not enough to establish that it had already been disclosed. In other words, general information could not anticipate a more specific technical feature.

In **T 410/99** the board added that a prior art disclosure was novelty-destroying if it disclosed directly and unambiguously the subject-matter in question, account also being taken of a skilled person's common general knowledge at the publication date of the cited document in the case of prior art cited under **Art. 54(2) EPC 1973**, or at the priority date of the cited document in the case of an **Art. 54(3) EPC 1973** document (see e.g. **T 511/92**, **T 412/91**).

In **T 2397/11** the objection of lack of novelty based on prior art D1 failed. The board noted that it was a generally applied principle for concluding lack of novelty that there must be a direct and unambiguous disclosure in the state of the art which would inevitably lead to subject-matter falling within the scope of the claim. Where gaps in experimental detail exist, these may be filled by the skilled person with his common general knowledge using conventional techniques within reasonable limits, provided that the choices made are not material to the end results (see, for example, **T 1753/06**, in particular, points 4.11, 4.13, 4.16.1 and 4.17 of the Reasons).

In T.412/91 the board decided that a prior art disclosure had to be read giving the information it contained the meaning that a skilled person would have given it at its publication date and disregarding information which would be understood by a skilled person to be wrong; however, any teaching which would not be recognised as wrong by a skilled person had to be accepted as state of the art.

In T.546/07 the board found that the skilled person reading a document did not construe individual points of the disclosure in isolation, but rather in the context of the document as a whole (T.312/94, T.860/06).

In T.1849/08 the board stated that what was decisive for the information content of a prior art document was what a person skilled in the art reading the document would understand from it. If a skilled reader of a prior art document containing an isolated statement that a diagram in a figure was "not to scale" could find nothing in the figure itself or in the rest of the document supporting this statement, he would consider the statement to be made in error and disregard it.

It is a well-established principle laid down by the boards' case law that a non-specific definition in a claim should be given its broadest technically sensible meaning (see T.79/96, T.596/96).

In T.969/92 the board decided that, in order to determine what had been made available to the public, not only the main claim but also the remainder of a **patent document** had to be carefully considered for guidance as to what had really been taught in the prior document, i.e. its real express and implicit information content.

The board in T.1658/12 stated that, in determining what is made available to the public within the meaning of Art. 54(2) EPC by a prior art patent document, it must be borne in mind that it is the description which chiefly serves to disclose the invention in a manner that it may be carried out, whereas the chief function of the claims is to define the subject-matter for which protection is sought. Where a combination of features is found only in the claims (or only in the claims and a "Summary of the Invention" which merely recites the features of the claims), it must be very carefully considered whether this combination truly corresponds to the technical teaching of the document as it would be understood by a skilled person, or whether it is merely an artefact of the claim drafting process aimed at obtaining maximal scope of protection (see point 3.8 of the Reasons; also T.312/94, Catchword; T.969/92, point 3 of the Reasons, and in particular, page 4, first paragraph; T.42/92, "Orientierungssatz").

In T.2020/13 the board stated that where a technical term such as a **trade name** is known to have changed, this circumstance is to be taken into account in order to attribute to that technical term its proper meaning and to understand the technical teaching meant to be conveyed by the prior art document (see abstract of this decision in this chapter I.C.3.2.1 h).

According to decision T.158/96, the information in a citation that a medicament was undergoing a clinical phase evaluation for a specific therapeutic application was not

prejudicial to the novelty of a claim directed to the same therapeutic application of the same medicament, if such information was plausibly contradicted by the circumstances, and if the content of said citation did not allow any conclusion to be drawn with regard to the actual existence of a therapeutic effect or any pharmacological effect which directly and unambiguously underlay the claimed therapeutic application (see also T. 385/07, T. 715/03, T. 1859/08).

In T. 1859/08 the board first observed that independent claims 1 and 10 were in the form of medical use claims, the novelty of which was derived from the intended medical use. As a consequence, all the technical features of the therapeutic indication specified in the claims had to be taken into account when considering whether or not the claimed subject-matter was novel. The board noted that prior art document D1 did not involve humans, whereas the claims before the board were directed to the treatment of breast cancer in a human patient. Further, D1 stated that the combination therapy disclosed in the study was "currently being explored". The board held that a mere statement that a combination therapy was being explored did not amount to a novelty-destroying disclosure. The "currently being explored" situation, where no clinical benefit was disclosed, fell within the rationale of decisions T. 158/96 and T. 715/03. According to these decisions, if a prior art document disclosed clinical investigations such as phase I, II or III studies (or stated that these investigations were ongoing), but failed to disclose the final result of these studies, it was not novelty-destroying. The board concluded that there was no description in the prior art documents of the treatment of a human patient, nor any disclosure of the biological effect. Therefore, the claims satisfied the requirements of Art. 54 EPC.

In T. 943/93 the board held that a **hypothetical possibility** of operating within the claimed area was not per se sufficient in law to deprive this area of novelty, particularly if the skilled person had no technical motive and thus no practical necessity to work within this region (see also T. 892/05).

Decisive for novelty in T. 464/94 was a citation disclosing a preliminary test to transform plant protoplasts with selective markers. The opposition division had considered it probable that this document anticipated the patent in dispute. In the board's view, it was not justifiable to decide whether a document was prejudicial to novelty on the basis of probability. When a patent was revoked for lack of novelty, the department concerned had to be sure, having taken all the facts and arguments put forward during the proceedings into consideration, that the revocation was justified (see also T. 892/05).

In T. 233/90 the board took the view that in a case where a document comprised in the state of the art under Art. 54(3) EPC 1973 referred to "**a usual manner**" of preparing a product, it was permissible to use documents of reference such as handbooks, encyclopaedias or dictionaries in order to determine what the skilled person would have understood by such a reference on the effective date of the prior document.

In T. 4/00 the board held that the points of a graph in a diagram in a prior art document did not represent a disclosure of the corresponding values read from the scales of the diagram, if the accuracy of the graph in the diagram could not be established.

4.2. Combinations within a prior art document

It is not permissible to combine separate items of prior art together. It is also not permissible to combine separate items belonging to different embodiments described in one and the same document, unless such combination has specifically been suggested (T. 305/87). In T. 1988/07 the board emphasised that for the examination of novelty different passages in a document can only be combined if there is a clear teaching combining them.

A claimed subject-matter would lack novelty only if a "clear and unmistakable teaching" of a combination of the claimed features could be found in a prior art disclosure (T. 450/89, T. 677/91, T. 447/92 and T. 511/92).

When contesting the novelty of a claim, the content of a document must not be treated as something in the nature of a reservoir from which features pertaining to separate embodiments may permissibly be drawn in order to create artificially a particular embodiment which would destroy novelty, unless the document itself suggests such a combination of features. This is confirmed by e.g. T. 450/89, in which the board stated that "a conclusion of lack of novelty ought not to be reached unless the prior art document contains a clear and unmistakable disclosure of the subject-matter of the later invention" (see also T. 677/91, T. 763/07).

In T. 305/87 (OJ 1991, 429) the board considered it expedient to state that, in order to assess novelty, it was not sufficient to limit oneself to the contents of a single document taken as a whole, but rather it was necessary to consider separately each entity described therein. It was not permissible to combine **separate items belonging to different embodiments** described in one and the same document merely because they were disclosed in that one document, unless of course such combination had been specifically suggested there. In the case at issue, the two shears known from the catalogue were therefore definitely two separate entities forming two independent bases for comparison which ought to be considered in isolation when assessing novelty, and it was not admissible to piece together artificially a more relevant state of the art from features belonging to one or both of these entities, even if they were both disclosed in one and the same document (see T. 901/90, T. 931/92 and T. 739/93, T. 763/07).

In T. 332/87 the board, after having recalled that the disclosure of a document normally had to be considered as a whole, held that, when examining novelty, different passages of one document might be combined, provided that there were no reasons which would prevent a skilled person from making such a combination. In general, the technical teaching of examples might be combined with that disclosed elsewhere in the same document, e.g. in the description of a patent document, provided that the example concerned was indeed representative of, or in line with, the general technical teaching disclosed in the respective document (see also T. 1630/07, T. 2188/08, T. 1239/08, T. 568/11).

According to established case law, the disclosure of a patent document does not embrace the combination of individual features claimed in separate dependent claims if such combination is not supported by the description (cf. T. 525/99, T. 496/96, T. 42/92).

In T. 42/92 it was explained, in accordance with the boards' established case law, that a pre-published patent specification formed part of the state of the art under Art. 54(2) EPC 1973 only as regards those elements which the person skilled in the relevant art would incontestably infer from the document as a whole. The disclosure of a prior-art patent specification did not however cover combinations of individual features arising from **reference back to the claims** if those features were claimed separately for patent-law considerations and combining them was not supported by the description, or even – as here – was at odds with the embodiments described.

In decision T. 610/95, in view of the objection of lack of novelty, the question to be answered was whether or not the proposed solution in the patent was derivable directly and unambiguously from the disclosure of citation (2), which contained **cross-references** to the entire content of **three patent specifications** without giving priority to any of these references. Each of these references offered a plurality of different options for preparing pressure-sensitive layers of medical dressings. The board held that, under these circumstances, it could not be said that the use of the specific product acting as pressure-sensitive material in the claimed invention was directly and unambiguously derivable from the wholly general reference to the three different prior documents quoted in citation (2) and had therefore already been made available to the public.

4.3. Taking implicit features into account

According to the boards' established case law, a prior art document anticipates the novelty of claimed subject-matter if the latter is directly and unambiguously derivable from that document, including any features implicit to a person skilled in the art. However, an alleged disclosure can only be considered "implicit" if it is immediately apparent to the skilled person that nothing other than the alleged implicit feature forms part of the subject-matter disclosed (T. 95/97, T. 51/10). In other words, a prior art disclosure is novelty-destroying if the subject-matter claimed can be inferred directly and unequivocally from that disclosure, including features which for the skilled person are implicit in what is explicitly disclosed (see T. 677/91; T. 465/92, OJ 1996, 32; T. 511/92; and T. 2170/13, which is a more recent decision finding that the feature at issue was implicitly disclosed in the prior art and devoting lengthy technical arguments to the point.

The limitation to subject-matter "derivable directly and unambiguously" from the document is important. According to the boards' case law on assessing novelty, the teaching of a document, independent of its nature, is not to be interpreted as embracing equivalents not disclosed in that document (see also T. 167/84, T. 517/90, T. 536/95). This is a matter of obviousness (see Guidelines G-VI, 2 – November 2018 version).

In T. 701/09 the board found that direct and unambiguous disclosure was not limited to explicit or literal statements, but equally included implicitly disclosed information which a reader skilled in the art would unequivocally gather from the overall context of a cited document.

In T. 1523/07 the board observed that it is a generally applied principle that for concluding lack of novelty, there must be a direct and unambiguous disclosure, either explicit or

implicit, in the state of the art which would inevitably lead the skilled person to subject-matter falling within the scope of what is claimed. In this context "implicit disclosure" means disclosure which any person skilled in the art would objectively consider as necessarily implied in the explicit content, e.g. in view of general scientific laws. In this respect, the term "implicit disclosure" should not be construed to mean matter that does not belong to the content of the technical information provided by a document but may be rendered obvious on the basis of that content. Whilst common general knowledge must be taken into account in deciding what is clearly and unambiguously implied by the explicit disclosure of a document, the question of what may be rendered obvious by that disclosure in the light of common general knowledge is not relevant to the assessment of what is implied by the disclosure of that document. The implicit disclosure means no more than the clear and unambiguous consequence of what is explicitly mentioned (see T. 823/96, T. 297/11). Implicit disclosure means disclosure which any person skilled in the art would objectively consider as necessarily implied in the explicit content (T. 2522/10 of 16 April 2015). T. 1523/07 was cited in the recent case T. 1085/13 (novelty of higher degree of purity).

In T. 51/10 the board held, in summary, that, for a feature to be "implicit", it was essential that it could be unequivocally gathered from the overall context of a cited document (T. 701/09) or necessarily followed from that context (T. 1523/07). In particular, the skilled person had to be unable to conceive of any realistic alternative to the allegedly implicit feature (T. 287/16).

In T. 6/80 (OJ 1981, 434) the board found that where a further functional attribute of an element of a **device** disclosed in a document was immediately apparent to a person skilled in the art reading the document, such attribute formed part of the state of the art with regard to that device.

In T. 666/89 (OJ 1993, 495) the board stated that the term "available" clearly went beyond literal or diagrammatical description, and implied the communication, express or implicit, of technical information by other means as well. One example of the available **information content of a document** extending beyond this literal descriptive or diagrammatical content was the case where the carrying out of a **process**, specifically or literally described in a prior art document, **inevitably resulted in a product** not so described. In such a case the prior art document would deprive a claim covering such a product of novelty. It was thus content, express and implied, rather than mere form, that was decisive for the issue of novelty in general, and "selection" novelty in particular (T. 793/93).

In T. 270/97 the opposition division considered the claimed product to be anticipated by the agent produced and inevitably obtained by repeating examples 1 and 2 of a prior art document. The board noted that it was a well-established principle laid down in the case law since T. 12/81 (OJ 1982, 296) that the product inevitably resulting from a process properly defined as to its starting substance and reaction conditions was considered to be disclosed even if it was not cited *expressis verbis* in the prior art document. The board, however, found that the method disclosed in the text of example 2 implied a way of acting not envisaged in the method according to the patent in suit. The parties' attempts to show that the particles obtained according to example 2 were, or were not, identical to the

products of the patent in suit, produced highly contradictory results. Therefore, the board could only conclude that depending on experimental conditions not disclosed in example 2 different products might be obtained. Thus, the claimed product was not inevitably obtained by following the method of example 2.

In T. 583/01 the board, following T. 270/97, stated that novelty was a question of inevitability and not a question of probability.

The patent at issue in T. 1456/14 was for a vacuum cleaner with a filter and its claim 1 was directed to the proportion of total length to area. That no total length was disclosed in the cited prior-art document was, the board held, irrelevant for the purposes of assessing novelty if it could be demonstrated that it undoubtedly covered the claimed proportion nonetheless. To do so, it sufficed to show that even a smaller numerical value necessarily exceeded by the prior-art device would be in keeping with the claimed proportion, as this meant the prior-art document definitely had to encompass that proportion too. Whether a known device had an implicit (or even explicit) feature did not depend on whether or not the skilled person's attention was likely to be drawn to precisely that feature but on whether, from a purely objective perspective, it had to have that feature. For the criterion of "direct and unambiguous disclosure" to be met, it was not essential that the skilled person would realise the feature was included even without knowing about the patent. EPO departments were to examine disclosure with the eyes and understanding of the skilled person, but that did not mean they did not do so purposively, in full knowledge of the feature they were looking for. Such an approach did not amount to an impermissible consideration of equivalents.

In T. 518/91 the board held that the logical interpretation by a skilled person of technical facts explicitly stated in a prior document – in particular the definition beyond the explicit disclosure of the document of features of the prior art described in general terms – was not part of the technical teaching implicitly derivable from the document, which the skilled person would automatically infer, if it contradicted other explicit technical information in the otherwise consistent overall disclosure of the document.

In T. 2387/13 (no implicit disclosure of a possible use) the board stated that the mere fact that the disclosed electrical transmission line in D2 could be used as a sensor did not mean that a sensor was disclosed. In order for such a use to be possible, there would have to be further installations. Such installations were, however, not disclosed.

In T. 624/91 it was held that exact **disclosures for alloy compositions** in the state of the art had to be interpreted as average or nominal values within a small range in view of known fluctuations in reproducibility and in analytical results, unless there was evidence available to the contrary. The board pointed out that, whenever a metallurgist aimed at producing an alloy in accordance with a given nominal composition, the composition of the final product would deviate somewhat from this target or even be undefined within certain narrow limits. The metallurgical production process was not ideally reproducible and the actual composition of different batches aiming at the same nominal composition would be spread over a certain area around this target (see also T. 718/02, T. 324/12).

In T 71/93, it was held that a feature not explicitly mentioned in a prior art document, even though generally known to help overcome a drawback usual in the same technical field, could not be considered implicitly disclosed if it were not directly derivable from the prior art document that the drawback was considered unacceptable and/or if other solutions were proposed for overcoming the drawback.

In T 572/88 and T 763/89 the boards warned against using the concept of "implicit prior description" in such a way that considerations relevant to the evaluation of inventive step were transferred to the assessment of novelty. A fair assessment of an invention's patentability called for a clear distinction between novelty and inventive step. In decision T 763/89, for example, the opponent could not claim "implicit prior description" for a material with exactly three layers, as claimed in the disputed patent, on the grounds that a skilled person, aware of the considerable outlay required for further sub-layers and the limited improvement in the quality of the image they bring, would have understood the wording of the claim, which set no upper limit for the number of layers, to be virtually synonymous with "two or three layers". To do so would be to adduce a typical criterion for the evaluation of inventive step.

Likewise in T 71/93 the board held that an "implicit prior description" of a feature could not be based on the grounds that a person skilled in the art would have been aware of some disadvantages and of the lack of other forms of improvement related to a feature, since this was a criterion for the evaluation of inventive step.

4.4. Taking intrinsic features into account

In T 59/87 (OJ 1991, 561) the respondent had contended that a particular document inherently disclosed the claimed invention and was therefore destructive of novelty. However, the board stressed that decision G 2/88 (OJ 1990, 93, Corr. 469) emphasised that the question to be decided was what had been made available to the public, not what might have been inherent in what was made available to the public. Furthermore, when considering how far the teaching in a written description also made the inevitable result of carrying out such teaching available to the public, in each case "a line must be drawn between what is in fact made available and what remains hidden or otherwise has not been made available". Thus, the board decided that whether a previously undisclosed technical effect, which in fact inevitably occurred when a previously disclosed technical teaching in a written description was carried out, had been made available to the public by reason of the teaching in the written description was a question of fact which had to be decided in the context of each individual case.

G 1/92 (OJ 1993, 277) further stipulated that a commercially available product did not per se implicitly disclose anything beyond its composition or internal structure. Other characteristics, which were only revealed when the product was exposed to interaction with specifically chosen outside conditions in order to provide a particular effect or result, or to discover potential results or capabilities, therefore pointed beyond the product per se as they were dependent on deliberate choices being made and thus could not be considered as already having been made available to the public.

Further to this decision, the board held in T.977/93 (OJ 2001, 84) that a product made available to the public was not reproducible within the meaning of G.1/92, and thus did not belong to the state of the art, if the skilled person could not establish that the reproduced product was identical to the commercially available one, because the intrinsic and extrinsic features of the product were not accessible and there was a high probability of variation upon reproduction.

4.5. Taking equivalents into account

The case law of the boards of appeal is based on a narrow concept of novelty, i.e. the disclosure of a prior document does not include equivalents of the features which are explicitly or implicitly disclosed; equivalents can only be taken into account when it comes to considering inventive step (T.517/90). This narrow concept of novelty, which excludes equivalents, is of particular importance for the application of Art. 54(3) EPC. In T.167/84 (OJ 1987, 369) the board commented that conflicting applications within the meaning of Art. 54(3) EPC 1973 were included in the state of the art solely from the point of view of novelty, but were considered in the light of their "whole contents". In order to mitigate the harsh effects of the "whole contents approach", its application was confined to novelty. Further, in order to reduce the risk of "self-collision", it had always been considered justified to adopt a strict approach to novelty. For this reason, the Guidelines expressly stated that "when considering novelty, it is not correct to interpret the teaching of a document as embracing well-known equivalents which are not disclosed in the document; this is a matter of obviousness" (Guidelines G-VI, 2 – November 2015 version). According to the case law of the boards of appeal the "whole contents" of an earlier document did not also comprise features which were equivalents of features in the later document (see also T.928/93, T.1387/06).

In T.652/01 the appellant was of the opinion that although the relevant prior-art document did not explicitly mention a particular feature, that feature could be derived from the document by applying the document's teaching *mutatis mutandis*. The appellant had referred to T.952/92 (OJ 1995, 755), which, in its first headnote, stated that "availability" within the meaning of Art. 54(2) EPC 1973 involved not only availability of the disclosure but also availability of information accessible and derivable from the disclosure, which meant that "derivable equivalents" were included. However, the board held that, when reading the cited phrase from T.952/92 in the context of the present decision, it was clear that the term "derivable" had been employed in the sense of "obtainable by chemical analysis of a sample" and that it was used with the same restriction as expressed in opinion G.1/92 (OJ 1993, 277), namely that it had to be "directly and unambiguously derivable".

4.6. Taking drawings into account

In T.896/92 the board emphasised that, in accordance with T.169/83 (OJ 1985, 193), further conditions were required as to the disclosure of a feature shown solely in a drawing. In this respect, not only should the structure of the feature be shown sufficiently clearly in the drawing, but also the technical function achieved should be derivable (see also T.241/88).

In T. 204/83 (OJ 1985, 310) the board held that features shown solely in a drawing formed part of the state of the art when a person skilled in that art was able, in the absence of any other description, to derive a technical teaching from them. Dimensions obtained merely by measuring a diagrammatic representation in a document did not, however, form part of the disclosure (see T. 857/91, T. 272/92, T. 1488/10).

In T. 451/88 the distinction was drawn between scaled construction drawings and the schematic drawings conventionally included in patent documents, the latter being sufficient to indicate the essential elements of the invention but not to manufacture the product. It was found that schematic drawings could not be used to derive a ratio between two dimensions (T. 1664/06).

In T. 56/87 (OJ 1990, 188) the board held that a technical feature which was derived from or based on dimensions obtained from a diagrammatic representation and which technically contradicted the teaching of the description, did not form part of the disclosure of a document.

T. 748/91 was concerned with measuring relative dimensions in drawings. In that case the board found that size ratios could, under certain circumstances, be inferred even from a schematic drawing.

In T. 2052/14, the board observed that, even though the examining division had had the impression that drawings in a prior-art document showed the feature in the characterising portion of claim 1, that did not amount to a direct and unambiguous disclosure for the skilled person, who would know that those drawings were merely schematic views from which, in the absence of any specifications, no specific sizes or proportions could be derived. Since the drawings at issue were not marked as true to scale, they could only be standard schematic views.

4.7. Taking examples into account

In T. 12/81 (OJ 1982, 296) the board held that the teaching of a cited document was not confined to the detailed information given in the examples of how the invention was carried out, but embraced any information in the claims and description enabling a person skilled in the art to carry out the invention (see also T. 562/90). In T. 424/86 the board stated that the disclosure of a document was not to be construed only on the basis of the examples thereof; rather, the entire document had to be taken into consideration (see also T. 373/95). In T. 68/93 the board stated that it was not allowable to take a particular example out of context. In T. 12/90, the board decided that the disclosure in a prior document likely to affect the novelty of a claim was not necessarily limited to the specific working examples, but also comprised any reproducible technical teaching described in the document (see also T. 247/91 and T. 658/91).

In T. 290/86 (OJ 1992, 414) the board decided that what was "made available to the public" by specific detailed examples included in a document was not necessarily limited to the exact details of such specific examples but depended in each case upon the technical teaching which was "made available" to a skilled reader. The amendment of a claim by

including a disclaimer in respect of such specific detailed examples could not render the claim novel.

In T. 666/89 (OJ 1993, 495) the board stated it was necessary to consider the whole content of a citation when deciding the question of novelty. In applying this principle, the evaluation was therefore not to be confined merely to a comparison of the claimed subject-matter with the examples of a citation, but had to extend to all the information contained in the earlier document.

In T. 1049/99 the board noted that in the case of a "written description" open to public inspection, what is made available is all the information contained in that description. In some cases, the information contained in the written description, such as teaching on ways of carrying out a process, also provides access to other information necessarily resulting from the application of that teaching (T. 12/81, OJ 1982, 296; T. 124/87, OJ 1989, 491; T. 303/86).

4.8. Broad claims

In T. 607/93 the board decided that when novelty and inventive step were being assessed, there was no reason to use the description to interpret an excessively broad claim more narrowly, if it was a question not of understanding concepts that required explanation but rather of examining an excessively broad request in relation to the state of the art.

4.9. Deficiencies and mistakes in a disclosure

Mistakes in a document do not in themselves constitute prior art such as to prevent the grant of a patent.

In T. 77/87 (OJ 1990, 280) the abstract published in the journal "Chemical Abstracts" did not correctly reproduce the original paper. The board stated that the original document was the primary source of what had been made available as a technical teaching. Where there was a substantial inconsistency between the original document and its abstract, it was clearly the disclosure of the original document that had to prevail. The disclosure in the original document provided the strongest evidence as to what had been made available to the skilled person. When it was clear from related, contemporaneously available evidence that the literal disclosure of a document was erroneous and did not represent the intended technical reality, such an erroneous disclosure should not be considered part of the state of the art.

In T. 591/90 a prior document again contained mistakes. The board distinguished this case from T. 77/87 (OJ 1990, 280), which had concerned a special case, and took the view that a document normally formed part of the prior art even if its disclosure was deficient. In evaluating such a disclosure it was to be assumed, however, that the skilled reader was mainly "interested in technical reality". Using his general technical knowledge and consulting the reference literature, he could see at once that the information in question was not correct. It could be assumed that a skilled person would try to correct recognisable

errors, but not that he would take the deficient disclosure as pointing the way towards a solution to an existing technical problem.

In T 412/91 the board took the view, having regard to Art. 54 EPC 1973, that the incorrect teaching of document (1) was not comprised in the state of the art. It stated that, in principle, what constituted the disclosure of a prior art document was governed not merely by the words actually used in its disclosure, but also by what the publication revealed to the skilled person as a matter of technical reality. If a statement was plainly wrong, whether because of its inherent improbability or because other material showed that it was wrong, then – although published – it did not form part of the state of the art. Conversely, if the skilled person could not see the statement was wrong, then it did form part of the prior art. (The board in T 523/14, in which an advertising newsletter was alleged to be prior art, found that the case was not comparable to T 412/91, which one of the parties had cited).

In T 89/87 the board found that "0.005 mm" (= 5 μm) was a misprint contained in the prior document and that only "0.0005 mm" (= 0.5 μm) was correct. The board stated that the correction was such that the skilled reader would be expected to make it as a matter of course.

In T 230/01 the board noted that a document normally forms part of the state of the art, even if its disclosure is deficient, unless it can unequivocally be proven that the disclosure of the document is **not enabling**, or that the literal disclosure of the document is manifestly erroneous and does not represent the intended technical reality. Such a non-enabling or erroneous disclosure should then not be considered part of the state of the art.

In T 428/15 the objection that D3 anticipated the subject-matter of claim 1 was based on passages of a **computer-generated translation** whose quality did not allow the board to understand with a sufficient degree of certainty what was in fact described in D3. Furthermore, the appellant did not submit a human translation of the relevant passages, which would have clarified the issue, or provide technical explanations which would have rendered credible that the true meaning of the vague passages concerning the use of chloroform and the apparently described rinsing step was immaterial to the conclusion to be drawn in respect of the nature of obtained product A1. Compare with T 655/13, in which the board considered the examining division's failure both to identify in its decision the relevant passage of a Japanese technical journal it had cited as prior art allegedly disclosing one of the claimed features and to provide a translation of that passage amounted to a breach of the duty to give reasons (R 111(2) EPC).

4.10. Accidental disclosure

An anticipation is accidental if it is so unrelated to and remote from the claimed invention that the person skilled in the art would never have taken it into consideration when making the invention. When an anticipation is taken as accidental, this means that it appears from the outset that the anticipation has nothing to do with the invention (G 1/03 and G 2/03, OJ 2004, 413 and 448; T 134/01, T 1911/08).

In G.1/03 and G.2/03 (OJ 2004, 413 and 448), the Enlarged Board of Appeal observed that different definitions of accidental anticipation had been put forward (see referrals T.507/99, OJ 2003, 225 and T.451/99, OJ 2003, 334). Often cited were decisions T.608/96 and T.1071/97, which said in similar terms that a disclosure was accidentally novelty-destroying if it was disregarded by the skilled person faced with the problem underlying the application, either because it belonged to a remote technical field or because its subject-matter suggested it would not help to solve the problem. Thus, according to these decisions, the disclosure had to be completely irrelevant for assessing inventive step.

The Enlarged Board noted that the individual elements of these and other attempts to find an adequate definition could not be taken in isolation. The fact that the technical field was remote or non-related might be important but was not decisive because there were situations in which the skilled person would also consult documents in a remote field. Even less decisive, as an isolated element, was the lack of a common problem, since the more advanced a technology was, the more the problem might be formulated specifically for an invention in the field. Indeed, one and the same product might have to fulfil many requirements in order to have balanced properties making it an industrially interesting product. Correspondingly, many problems related to different properties of the product might be defined for its further development. When looking specifically at improving one property, the person skilled in the art could not ignore other well-known requirements. Therefore, a "different problem" might not yet be a problem in a different technical field. What counted was that from a technical point of view, the disclosure in question had to be so unrelated and remote that the person skilled in the art would never have taken it into consideration when working on the invention (to this effect, see T.608/96, cited in referral T.507/99). This should be ascertained without looking at the available further state of the art because a related document did not become an accidental anticipation merely because there were other disclosures which were even more closely related. In particular, the fact that a document was not considered to be the closest prior art was not sufficient to accept an accidental anticipation (see, however, T.170/87, OJ 1989, 441).

Accidental anticipation understood in the sense outlined above not only corresponds to the literal meaning of the term, but also limits disclaimers to situations in which there is a justification comparable to the case of conflicting applications for which the allowability of disclaimers has been accepted (see also chapter II.E.1.7. "Disclaimers").

In T.161/82 (OJ 1984, 551) the board found that the prior art document was concerned with the solution of a problem totally different from that stated in the application at issue and concluded that in cases where an anticipation was of a chance nature, in that what was disclosed in a prior document could accidentally fall within the wording of a claim to be examined for novelty without there being a common technical problem, a particularly careful comparison had to be made between what could fairly be considered to fall within the wording of the claim and what was effectively shown in the document (see also T.986/91).

4.11. Reproducibility of the content of the disclosure

According to the established case law a disclosure destroys novelty only if the teaching it contains is reproducible, i.e. can be carried out by the skilled person (T 1437/07, T 1457/09). Subject-matter described in a document can only be regarded as having been made available to the public, and therefore as comprised in the state of the art pursuant to Art. 54(1) EPC, if the information given therein to the skilled person is sufficient to enable him, at the relevant date of the document, to practise the technical teaching which is the subject of the document, taking into account also the general knowledge at that time in the field to be expected of him (see T 26/85, T 206/83, T 491/99, T 719/12 and Guidelines G-VI, 4 – November 2018 version).

In T 206/83 (OJ 1987, 5), in particular, it was found that a document did not effectively disclose a chemical compound, even though it stated the structure and the steps by which it was produced, if the skilled person was unable to find out from the document or on the basis of his common general knowledge how to obtain the required starting materials or intermediates. Information which could only be obtained after a comprehensive search was not to be regarded as part of the common general knowledge. This need for an **enabling disclosure** was also in conformity with the principle expressed in Art. 83 EPC 1973 for patent applications which had, accordingly, to "disclose the invention in a manner sufficiently clear and complete for it to be carried out by a person skilled in the art". The requirements as to the sufficiency of the disclosure were, therefore, identical in all these instances.

In T 719/12 neither party contested that document (1) disclosed the compound methyl-2-(α -thenoyl)-ethylamine by name. The board held that document (1) alone did not make the compound available to the public, since the specific attempts to prepare it which were described in that document had failed. Therefore, the board concluded that it had not been made available to the public, as no method for its preparation had been available at the publication date of the prior art.

For selection inventions the requirement of a reproducible disclosure also plays a significant role. In T 26/85 (OJ 1990, 22) the ranges of a certain parameter as defined in the claim fell within the broader ranges stated for the same parameter in a prior art document. The board considered that a realistic approach, when assessing the novelty of the invention under examination over the prior art in a case where overlapping ranges of a certain parameter existed, would be to consider whether the person skilled in the art would, in the light of the technical facts, seriously contemplate applying the technical teachings of the prior art document in the range of overlap; if it could be fairly assumed that this would be the case, it had to be concluded that no novelty existed. Such was not the case in the matter under consideration, since there existed in the prior art a reasoned statement clearly dissuading the person skilled in the art from using the range under a certain value, and the range of overlaps was under this value; the claimed range was therefore considered novel (see also T 255/91).

In T 447/92 the board held that the cited document did not disclose when or how far a movable piece in the claimed invention (an air circuit breaker) moved, or the way in which

it worked to prevent the spring-back of a lever. No relative movement was described or shown in the drawings and it was a matter of conjecture as to the manner in which the relevant parts co-operated. The board found that it might have been obvious to a skilled person that the notch could co-operate with the shaft in the manner defined in the claims of the patent in suit, but that this only meant that the disclosure took him close enough to do the rest himself. It did not mean that the document took the skilled person all the way to the present invention. Thus, the features of the air circuit breaker according to claim 1 of the application were not unambiguously derivable from the drawings of an earlier European patent application.

In **T.310/88** the board of appeal had to consider a discrepancy between what actually happened in practice when carrying out a technical teaching in a prior document according to the letter of its description, and what this prior document said would happen. The board held that the invention was novel over the prior document because the latter did not contain a sufficiently clear teaching for that conclusion not to be reached (see **T.23/90**).

In **T.491/99** the board held that an earlier patent, which used terminology which at first sight was suggestive of the product invention claimed, was not in fact a prejudicial disclosure if a skilled person could actually only make the product in question later, from the process and machine described for the first time in the European patent in suit.

In **T.1437/07** the board pointed out that a disclosure in a prior art document is novelty-destroying only if the teaching it contains is reproducible. This need for an enabling disclosure is in conformity with the principle expressed in **Art. 83 EPC**. Thus, the requirements of sufficiency of disclosure are identical for a prior art document and a patent. The board followed the principles developed by the case law in the framework of the evaluation of the requirements of **Art. 83 EPC** in the case of a medical use, i.e. that the skilled person should not only be able to carry out the teaching of the prior art document, but it should also be credible that the effect at issue – here, relief of pain – has been achieved (see also **T.491/08**).

In **T.578/12** the appellant contested that claim 1 of the main request was not new in view of prior art document D1, an Australian patent application; its main argument was that D1 had no drawings or any description of a detailed embodiment of any dispensing machine and could not be regarded as an enabling disclosure. The board noted *inter alia* that the fact that D1 did not contain any figures did not hinder the skilled person from understanding the described method or from carrying it out. The decision in this case gives an example of a detailed set of reasons for the outcome of examining features disclosed by a prior-art document.

In **T.1457/09** claim 4 was drafted as a second medical use claim. In the decision under appeal the opposition division held that the subject-matter of the corresponding claim was anticipated by the intermediate document (D1). The opposition division considered that both documents (D1) and (D1a, the priority document of D1) disclosed pharmaceutical compositions comprising the peptide RMFPNAPYL and their use as a cancer vaccine. The board found that for the requirement of reproducibility to be considered as fulfilled in relation to a medical use it is necessary that the disclosure in the prior-art document is

such as to make it credible that the therapeutic effect on which the disclosed treatment relies can be achieved (**T. 609/02**). The board held that in the case at issue a prior art document was novelty-destroying only if it disclosed not only the product referred to in the claim – here RMFPNAPYL – for the claimed therapeutic application – here treatment of cancer – but also that the claimed product was indeed suitable for the claimed therapeutic application. The board concluded that the experimental results disclosed in document (D1a) were not sufficient to make it credible that the RMFPNAPYL peptide was suitable for the treatment of cancer. Therefore document (D1) did not destroy the novelty of the subject-matter of claim 4.

5. Ascertaining differences

Once the state of the art has been established, using the criteria described above, and its content has been determined, the final step is to ascertain whether the invention in question differs from the prior art.

5.1. Comparing each individual item from the prior art

When the invention is compared for novelty purposes with the state of the art as determined by applying the criteria described above, this must be done only on the basis of each element of prior art taken as a whole (see **T. 153/85**, OJ 1988, 1; **T. 124/87**, OJ 1989, 491; **T. 233/90**, **T. 904/91**).

If, however, there is a specific reference in one prior document (the "primary document") to a second prior document, when construing the primary document (i.e. determining what it means to the skilled person) the presence of such a specific reference may necessitate part or all of the disclosure of the second document being considered as part of the disclosure of the primary document (see **T. 153/85**, OJ 1988, 1; **T. 645/91**; **T. 942/91**; **T. 422/92**; **T. 866/93**; **T. 239/94**; **T. 221/05**).

According to the boards' settled case law, a strict approach must be taken to assessing novelty and, in cases of ambiguity or doubt, the content of a prior publication must be interpreted narrowly (see **T. 447/92**, **T. 988/95**, **T. 722/00**, **T. 1517/11**).

In **T. 291/85** (OJ 1988, 302) the board noted that the disclosure in a prior publication always included not only what it presented as the teaching of the invention but also what it referred to as the prior art. In the board's view, however, when examining for novelty, to read into an account of the state of the art couched in very general terms specific details of the inventive teaching of the same document was permissible only where a person skilled in the art would in fact have made this combination when reading this document. Thus, the board concluded that if a citation gave detailed information about a further development of a prior art described only in very general terms without quoting a specific source, it was not permissible in examining for novelty to combine these general statements with the specific statements made solely in order to explain the said development, unless a person skilled in the art would have made the combination when reading the citation.

In T 288/90 the board observed that, although for the purposes of assessing novelty it was not normally legitimate to read two documents together, nevertheless, when interpreting a single document, it was necessary to read it having the general technical knowledge in mind, and for this purpose to look at representative technical literature as an aid to the correct interpretation of any particular term of art encountered.

In decision T 56/87 (OJ 1990, 188) the board emphasised that the technical disclosure in a document should be considered in its entirety, as it would be by a person skilled in the art, and that there could be no justification for arbitrarily isolating parts of the document in order to derive therefrom an item of technical information which would be distinct from or even contradict the integral teaching of the document. Thus, a technical feature which was derived from or based on dimensions obtained from a schematic illustration and which technically contradicted the teaching of the description did not form part of the disclosure of this document (see T 332/87, T 441/91 and T 657/92).

5.2. Distinguishing features

In T 4/83 (OJ 1983, 498) the board held that when assessing novelty, it should be taken into consideration that any information in a patent specification which conveyed to the person skilled in the art a technical teaching, belonged to the content of the disclosure irrespective of whether or not it fell within the scope of the claims or what purpose it served.

In T 223/05 the board held that the interpretation of the extent of the protection of a patent was not the task of the EPO, but, according to Art. 64 and 69 EPC 1973, that of the national courts competent in procedures on infringement cases (T 740/96, T 442/91). In particular, Art. 69 EPC 1973 did not offer any basis for reading into a claim features which could be found in the description when judging novelty (T 1208/97).

5.2.1 Difference in wording

In T 114/86 (OJ 1987, 485) the board held that a mere difference in wording was insufficient to establish novelty (see T 12/81, OJ 1982, 296; T 198/84, OJ 1985, 209; T 248/85, OJ 1986, 261). In T 565/90 the appellant submitted that only preferred ranges or examples amounted to a technical disclosure destructive of novelty, and that generic ones could not anticipate the more specific teaching of the patent in dispute. The board did not agree and confirmed earlier case law that the definition of an invention which differed from the prior art only in its wording was insufficient to establish novelty. The board stated that what had to be established was whether or not the state of the art made the subject-matter of the invention available to the skilled person in the form of a technical teaching.

In T 917/94 the board stated that incorporation of a technical feature which is redundant because it does not change the claimed subject-matter does not impart novelty to known subject-matter.

In T 826/94 the board was of the opinion that a claimed measuring device, which showed all the constructive features of a known measuring device and differed from the latter only

in name, i.e. in the dimensions to be measured, was novel if it was only at the level of abstract thought, when the basic principles of the two measuring devices were compared with each other, that the conclusion could be drawn that the two measuring instruments were of the same type.

In T.452/05 the board noted that, in principle, a specific term was not anticipated by a generic term. Nevertheless, in T.870/95 an exception was made if it were proven that, in the light of common general knowledge, the generic term could only be understood in the meaning of the more specific term. Since this was not the case, the board concluded that the generic term ("water permeable membrane") did not anticipate the specific term ("filtering paper").

In T.79/96 an extract from a handbook (D1) disclosed all the features of claim 1 of the patent in issue apart from the use of a "countercurrent gas/gravity classifier". Thus, with respect to novelty it only had to be decided whether a vibrating fluidised bed with an upwards gas flow through the bed of particles as described in D1 should be regarded as a countercurrent gas/gravity classifier. The definition of a countercurrent gas/gravity classifier was given in an extract from another standard handbook on chemical technology (D3). The proprietor of the patent was of the opinion that the definition given in D3 was too broad and that a person skilled in the art would not consider a fluidised bed, being a rather inefficient classifier, as a countercurrent gas/gravity classifier. The board did not share this view. It held that, when assessing novelty of the claimed subject-matter, an expression in a claim should be given its **broadest technically sensible meaning**. On that basis, any gas/gravity classifier, including a fluidised bed, satisfied the classification requirements of the claim 1 of the patent at issue. The subject-matter therefore lacked novelty over D1 (see also T.596/96, T.1126/05, T.452/11, T.2446/12).

5.2.2 Differences in values

In T.74/98 the board found no reason to round up figures obtained by converting prior art values originally expressed in a different unit of measurement. It was evident that any rounding-up following the conversion of these figures into molar amounts would affect the definition of those compositions. The board noted that it was also evident that the true meaning of a specific disclosure could not be influenced by the units chosen to express it and that the objection of lack of novelty relied on an ambiguity introduced artificially by the appellant.

In T.1186/05 the board drew a distinction between the case before it and the case before the board in T.74/98. In the latter case, the board had considered that rounding up to the next integer (thus matching the lower limit of the claimed "inventive" range) of a component's molar percentage having two decimal places, calculated by conversion from its weight proportion, was not justified because (i) this would lead to a broadening of the claimed range and (ii) reconversion of the rounded molar percentage to the corresponding weight proportion would also imply a modification of the latter, i.e. would alter the true meaning of this specific disclosure. However, in the case before it, the board in T.1186/05 pointed out that rounding up was required, in order to enable two density values to be compared, each one reflecting a "true" density value having three (or more) decimal

places, but expressed to a different degree of accuracy, i.e. one having three and the other one having only two decimal places. Thus, the rounding exercise put the claimed and the prior art density values on the same level by using the mathematical rule existing for that purpose. This exercise had no impact on the density value as disclosed in the prior art document (see also [T. 708/05](#)).

In [T. 234/09](#) the board observed that the claims defined the fibre composition in terms of numerical ranges of its constituent parts' percentage by weight, the appellant patent proprietor having chosen to express most of those ranges' limits as whole numbers. It found that, in the context of the patent in suit, the skilled person would appreciate that the whole numbers defining the limits of the ranges in claim 1 were not to be understood as whole numbers in the mathematical sense, and that they were therefore to be seen as limits deliberately expressed in a less precise form than the decimal numbers set out in the patent specification. Consequently, they also included the decimal numbers from which they resulted on application of the rules on rounding up numbers. It noted that the boards had already taken a similar approach in comparable cases (see e.g. [T. 1186/05](#)). Two of the decisions cited by the appellant had concerned situations in which, by contrast with the specific circumstances of the case in hand, there had been no particular reason to round up a figure disclosed only implicitly in the prior art (see [T. 74/98](#), [T. 646/05](#)). The board concluded that the percentage in the prior art, as rounded up for the purpose of comparison, could not be distinguished from the upper limit in claim 1 and that, therefore, the subject-matter of that claim was not novel.

In [T. 871/08 of 8 December 2011](#), prior art document D9 related to a method for hydrogen peroxide production by an anthraquinone method. The respondent had argued that the claimed subject-matter was novel, because the value 2.996 was lower than the lower limit of 3:1 defined in claim 1 at issue. This argument was not accepted by the board. When comparing a value from the state of the art (the value "2.996") with those claimed (the range of values "from 3:1 to 9:1"), the state of the art value had to be given the same accuracy as the one claimed. In the case at issue, the values in the claims had been quoted without any digit after the comma, which meant that for comparison purposes, the value 2.996 had to be rounded up to 3, which thus fell into the range of the claimed values (see, in particular, [T. 1186/05](#), [T. 708/05](#)).

In [T. 686/96](#) claim 1 related to a composition with a feature (iv) requiring a Perspex® abrasion value (PAV) in the range from about 12 to about 20 PAV. A prior art document disclosed in example 2 a composition having features (i) to (iii) of claim 1. With respect to novelty it had to be decided whether the known composition also had an abrasion value as required by feature (iv) of claim 1. The board established that the abrasion value of the known composition was somewhat below the lower value indicated in feature (iv) of the claim. Since the lower limit in the claim 1 was defined as "about 12", some interpretation was necessary. The board held that, when deciding on the novelty of the subject-matter of a claim, the broadest technically meaningful interpretation of a claim should be taken into account. In the board's view the scope of claim 1 was to be construed to mean that the indicated lower limit corresponded to the value disclosed in the prior art. Claim 1 was then considered to lack novelty.

5.2.3 Difference in parameters

In T. 1764/06 the board noted that the only expressed distinction between the definition of the claimed photocatalyst and the photocatalyst of D1 relied on a parameter feature that was not usual, let alone common, for the skilled person. The onus of proof in that respect lay on the applicants, but no proven distinction had been shown. As regards the benefit of the doubt, which in the applicant's view was to be accorded to applicants in complex situations without direct disclosure, the position of the board was that in a situation where the applicants have used an unusual parameter feature to define their product, which unusual parameter feature represents the only distinction over otherwise identical known products, and the applicants have decided not to provide evidence that the parameter feature as such represents a difference in the claimed products from the known products, no benefit of the doubt could be accorded.

Following T. 1764/06 the board stated in T. 1920/09 that since the applicants had decided to formulate the definition of the invention by an **unusual parameter**, the onus was on them to convincingly establish novelty over the illustrated embodiments of D8. However, no evidence had been adduced by the applicants to discharge their burden of proof (cf. also T. 1995/15).

5.2.4 Difference in composition

In T. 80/96 (OJ 2000, 50) an aqueous solution of the claimed tartrate compound was described in the prior art. The board held that, in the case of an active agent which was known as such to be water-soluble, it was clear to a person skilled in the art that describing and claiming the active agent as a solution did not add to or change the definition of that active agent. Without further specification, the mere characterisation of a solvent or diluent as liquid or solid in a claim did not change the assessment of the novelty of the subject-matter of the claim. Analogously, in a claim directed to a preparation of a known structurally defined active agent with at least one auxiliary substance, in which the feature "with an auxiliary substance or auxiliary substances" meant that something was added to the active agent, the admixture of an unspecified auxiliary substance could not, in view of the unlimited number of substances which might enter into consideration, be deemed a substantive and distinctive addition to the active agent, unless this feature, which was necessary if novelty was to be acknowledged, was specified in such a way that a person skilled in the art could recognise what it was that should be added to the active agent. The claim was therefore not new.

5.2.5 Functional features

In T. 500/89 it could only be seen from the disclosure considered in its entirety that the prior art document did not deprive the claimed invention of novelty, because the method constituting the closest prior art differed from the claimed method in one functional characteristic. The disputed patent related to a method for the production of photographic material by the simultaneous application of several layers of fluid photographic coating materials. Although the document cited in support of the opposition listed the numerical ranges for layer thickness, viscosity, coating speed, etc. used in the method claimed, the

latter was nevertheless held to be new because the cited document described the choice of these numerical ranges as leading to intermixing between two particular layers. The contested patent was to be assessed according to a different criterion because it described the application of the layers as being "substantially free from intermixing". The "intermixing" described as an objective in the citation was not merely a stated purpose not constituting one of the technical features of the method described, but a functional feature – a criterion, in effect – forming an essential element of the teaching set out in this publication.

According to the established case law, where a claim concerns an apparatus differing from a known apparatus only as regards to the use indicated, then the use is not an apparatus feature, meaning that two apparatuses (differing only in the intended use) are identical in terms of structure. If the known apparatus is suitable for the claimed use, the claimed invention lacks novelty. If, however, the claim is for a process, the situation is not comparable. In such a case, the use feature is a functional process feature comparable in category with the other features (steps) of the process (T 848/93 cited by T 1931/14). The opponent in T 1931/14 also referred to decision T 304/08, but the board stated that the situation in T 304/08 was quite different. The board in T 1931/14 concluded that T 848/93 and T 304/08 demonstrated that in the context of a method it was important to differentiate between different types of stated purpose, namely those that define the application or use of a method, and those that define an effect arising from the steps of the method and implicit therein. Where the stated purpose defines the specific application of the method, in fact it requires certain additional steps which are not implied by or inherent in the other remaining steps defined in the claim, and without which the claimed process would not achieve the stated purpose. In this manner the stated application represents a genuine technical limitation of the method and the claimed method must be applied in that manner. On the other hand, where the purpose merely states a technical effect which inevitably arises when carrying out the other remaining steps of the claimed method and is thus inherent in those steps, such a technical effect has no limiting effect because it is not suitable for distinguishing the claimed method from a known one.

In T 872/09 the board stated that the claimed sensor was defined by reference to characteristics of its response when used in a measurement set-up. Since none of the determining aspects of the measurement set-up was defined in claim 1, the technical features of the claimed sensor which were responsible for providing the measurement referred to in the claim remained obscure. Legal certainty required that a claimed subject-matter cannot be regarded as novel over the prior art on the basis of an ambiguous feature (see T 1049/99). Hence, defining a functional feature of the claimed electrochemical sensor under undefined operating conditions was not appropriate to provide any distinction of the claimed subject-matter over the prior-art electrochemical sensors.

T 2170/13 dealt with the re-drafting of claim 1 as a method claim (auxiliary request). The board endorsed the approach in T 1822/12 that G 2/88 (in relation to functional technical features) related only to a use claim, namely to a claim for the new use of a known compound, that the case law had constantly interpreted G 2/88 in a very restrictive manner and that there was no possibility to expand the ruling in G 2/88 and G 6/88 to a claim worded otherwise. Hence the undisclosed purpose could not be considered to be a

distinguishing functional technical feature of the claim. Following long technical arguments, the board also concluded (on the main request) that the final claimed feature was implicitly disclosed in prior art D1.

The term "means" is frequently used in the plural in the wording of patent applications, especially for functional definitions, but this does not actually rule out that there is only a single structural element (T 1794/12).

5.2.6 Generic disclosure

It is established case law that a specific disclosure destroys the novelty of a generic feature in a claim but that a generic disclosure does not destroy the novelty of a specific feature (see T 651/91, T 776/07, T 1174/05, T 6/04, T 776/07). A generic disclosure does not normally deprive a claimed specific embodiment of novelty (T 1786/09, see also Guidelines G-VI, 5 – November 2018 version).

In T 651/91 the board pointed out that a generic disclosure did not normally deprive any specific example falling within that disclosure of novelty. A disclosure could be generic even where it only left open the choice between two alternatives. In T 508/91 the board held that, on the other hand, the prior disclosure of the subset "vegetables" deprived the wider set "fruits and plants" of novelty (see also T 1204/00).

The disclosure "rastered halftone images, such as portraits" of prior art document D3 necessarily included portraits which fall under the understanding of the feature "at least one digitised mark made of at least one set of dots appearing as a three dimensional mark when viewed in transmitted light" as defined in the patent in suit. The fact that, in addition, there might be portraits which fall under the disclosure of document D3 but which did not correspond to the claimed feature did not invalidate the existence of those that do: the wording of the claimed feature was even more generic than the disclosure in document D3 and was thus anticipated by it (T 687/14).

5.2.7 Product claim with process features

In T 815/93 and T 141/93 the claims comprised both product features and features for a process for manufacturing the product. In both cases, only the process features distinguished the invention from the prior art. Following the case law on the novelty of product-by-process claims, the board found that process features not previously described could establish the novelty of the claimed product only if they caused it to have different properties from the products previously described. Neither the patent proprietor in the first case nor the applicant in the second case could demonstrate this.

5.2.8 Non-technical distinguishing features

Whereas novelty is not necessary to establish the technical character of an invention, the converse is not true as novelty and inventive step can only be established on the basis of the technical features of the invention. This is in line with the case law of the boards of appeal (T 154/04, OJ 2008, 46).

The Enlarged Board of Appeal held in decision **G 2/88** (OJ 1990, 93) that the claims of a European patent should clearly define the technical features of the subject invention and thus its technical subject-matter, in order that the protection conferred by the patent can be determined and a comparison can be made with the state of the art to ensure that the claimed invention is, *inter alia*, novel. A claimed invention lacks novelty unless it includes at least one essential technical feature which distinguishes it from the state of the art.

In **T 154/04** (OJ 2008, 46) the board stated that it is legitimate to have a mix of technical and "non-technical" features appearing in a claim, in which the non-technical features may even form a dominating part of the claimed subject matter. Novelty and inventive step, however, can be based only on technical features, which thus have to be clearly defined in the claim. Non-technical features, to the extent that they do not interact with the technical subject matter of the claim for solving a technical problem, i.e. non-technical features "as such", do not provide a technical contribution to the prior art and are thus ignored in assessing novelty and inventive step.

In **T 2050/07** the board confirmed the established case law according to which features that do not contribute to the technical character of an invention and do not interact with the technical subject-matter of the claim for solving a technical problem have to be ignored when assessing inventive step, such features should equally be ignored when assessing novelty. The board therefore examined whether or not the distinguishing features in the case before it made a technical contribution.

In **T 2191/13** the board observed that novelty could not be established on the basis of a distinction **made only mentally**, i.e. derived solely from pre-existing knowledge and not reflected in the technical features of the claimed subject-matter. It cited the Enlarged Board's ruling in **G 2/88** that a claimed invention lacked novelty unless it included at least one essential technical feature distinguishing it from the prior art. It followed from that decision that a feature of a merely mental nature could not be a new technical feature for the purposes of Art. 54 EPC and, therefore, that a claim containing only already known technical features could not be considered novel. This approach was also taken in **T 959/98**, **T 553/02** and **T 154/04**.

6. Chemical inventions and selection inventions

6.1. General

The state of the art often includes documents containing technical teachings described in general terms; these teachings in turn subsume a number of more specialised technical teachings. In assessing the novelty of subject-matter that can be subsumed under a general term in the state of the art, the question arises whether the general term makes the claimed matter fully or partially accessible to the public. In other words, it has to be established whether the general term used in the citation discloses the subject-matter defined by the special term in the claim. The prior-art disclosure needs to be identified particularly carefully in such cases. General terms of this kind occur particularly frequently in the chemical literature, which is why the relevant case law usually relates to this field. There are two types of case here:

(a) assessing the novelty of chemical substances and groups of substances in respect of general formulae (Markush formulae) under which they fall (see chapter I.C.6.2. "Novelty of chemical compounds and groups of compounds"), and

(b) assessing the novelty of products or processes defined by parameter ranges as against known products or processes characterised by wider or overlapping parameter ranges (see chapter I.C.6.3. "Selection of parameter ranges").

These types differ mainly in technical terms, but the same principles of patent law apply to both. For this reason, the boards of appeal have always been able to adopt the same approach to questions of this nature.

6.2. Novelty of chemical compounds and groups of compounds

According to the boards' case law, a specific combination of elements requiring the selection of elements from two known groups/lists cannot be regarded as disclosed in the art and so fulfils the novelty requirement (cf. T.12/81, OJ 1982, 296).

In the landmark decision T.12/81 (OJ 1982, 296) is stated that the teaching of a cited document is not confined to the detailed information given in the examples of how the invention is carried out, but embraces any information in the claims and description enabling a person skilled in the art to carry out the invention. If a product cannot be defined by a sufficiently accurate **generic formula**, it is permissible to make the definition more precise by additional product parameters such as melting point, hydrophilic properties, NMR coupling constant or the method of preparation (product-by-process claims). From this it necessarily follows that patent documents using such definitions will be prejudicial to the novelty of later applications claiming the same substance defined in a different and perhaps more precise way. Summarising, the board stated that in the case of one of a number of chemical substances described by its structural formula in a prior publication, the particular stereo-specific configuration of the substance – though not explicitly mentioned – was disclosed in a manner which was prejudicial to novelty, if it proved to be the inevitable but undetected result of one of a number of processes adequately described in the prior publication by the indication of the **starting compound** and the **process**.

The applicant argued that the novelty of the claimed product was based on a selection. The board used the opportunity to comment on this argument and develop **criteria for selection inventions** that have frequently been adopted in later decisions: A substance selection can come about if an unmentioned compound or group of compounds having a formula covered by the state of the art is found, in the absence of any information as to the starting substance or substances. The subject-matter in the case in question, however, did not involve a selection of that kind in an area which, although marked out by the state of the art, was nonetheless virgin territory. However, the disclosure by description in a cited document of the starting substance as well as the reaction process is always prejudicial to novelty because those data unalterably establish the end product. If, on the other hand, two classes of starting substances are required to prepare the end products, and examples of individual entities in each class are given in two lists of some length, then

a substance resulting from the reaction of a specific pair from the two lists can nevertheless be regarded for patent purposes as a selection and hence as new.

The board held that a combination of starting substances and process variants, however, was quite a different matter from a combination of two starting substances, and thus not comparable. At its simplest, if the starting substances were regarded as fragments of the end product, then every conceivable combination of a given starting substance in the first list with any starting substance in a separate second list of additionally required starting substances involved a true substantive modification of the first starting substance, since in every combination it was supplemented by a different fragment of the second starting substance to become a different end product. Each end product was thus the result of two variable parameters. However, combining a given starting substance from a list of such substances with one of the given methods of preparation did not result in a real substance alteration of the starting substance but only an "identical" alteration (see also T 3/89, T 1841/09).

6.2.1 Anticipation of certain compounds

a) Definition of a substance by its structural formula or other parameters

Following T 12/81 (see above) the board in T 352/93 decided that a claim for an ionic compound (salt) that was defined only by structural parameters, i.e. the structural formulae of the cation and anion of the compound, was not novel over prior art disclosing an aqueous solution that contained a base corresponding to the cation and an acid corresponding to the anion.

In T 1336/04 the board stated that, according to case law, (see, inter alia, T 767/95 and T 90/03), the preparation of an enzyme sufficiently pure to allow sequencing was novel over a preparation which was not in such a state of purity.

In T 767/95 concerned the purification of interleukin-1Beta (IL-1Beta), a high molecular weight protein (17.5 kDa). The board found that a purified homogeneous preparation of IL-1Beta was novel over a semi-purified mixture of proteins containing IL-1Beta. A relevant consideration was the provision of IL-1Beta in a degree of purity that allowed the determination of its (partial) amino acid sequence, whereas "no analysis of the amino acid sequence of IL-1 that would provide definitive proof of the homogeneity of IL-1 preparations" was found in the prior art (see also T 90/03, T 29/05).

b) Selection of starting substances from different lists

According to T 12/81 (OJ 1982, 296), an end product resulting from the reaction of a specific pair of starting substances may be seen as a novel selection for patent purposes if its preparation requires using entities from two classes of starting substances given in two lists of some length. This criterion has been applied to mixtures of two substances, selected from two lists (T 401/94) and confirmed in subsequent decisions (T 211/93, T 175/86, T 806/02, T 2436/10).

In **T. 401/94** the board again adopted one of the criteria for selection inventions laid down in decision **T. 12/81** (OJ 1982, 296), namely, that if two classes of starting substances were required to prepare the end products, and examples of individual entities in each class were given in two lists of some length, the substance resulting from the reaction of a specific pair from the two lists could be regarded for patent purposes as a selection and, hence, as new. The board stated that, although **T. 12/81** concerned the synthesis of a chemical product, and the case in question involved the preparation of a **mixture**, the claimed subject-matter was defined on the basis of two chemical entities, each of which had been selected from a list of compounds. Hence the criteria defined in **T. 12/81** were applicable here too. By analogy, the board held that, in this case, the claimed composition had to be viewed as a selection, and therefore as novel, as it corresponded to a specific combination of constituents, each of which had been selected from a relatively long list.

In **T. 366/96** the board held that if, when selecting two components of a composition from two known lists of possible ingredients, a skilled person had, as soon as one component was taken from the first list, no choice in selecting the second component from the second list in view of compelling technical necessities which made the particular second component mandatory, then this could not be considered to be a "twofold" selection which could render the resulting combination novel.

In **T. 754/10** the board came to the conclusion that contrary to the appellant's arguments, the novelty objection was not based on an unallowable selection from different lists, namely the presence or absence of a coating layer combined with the ranges for granule size, core size, total enzyme content and percentual coating content. In fact, there were no lists at all in prior art D15, but rather ranges of values for granule and core sizes and enzyme and coating contents. The need to refer to distinct parts of D15 derived from the fact that the granules as claimed and the granules of D15 were defined by different parameters. A further argument of the appellant was that none of D15's examples fell within the scope of claim 1; in particular they did not work within the area of overlap of the enzyme-content range. Hence the skilled person would not seriously contemplate working within this area of the disclosed range, and this was also in line with the usual practice in the field, which favoured the use of less concentrated enzyme (thus lower percentual enzyme content) in e.g. powder formulations. As regards to these arguments, the board noted that novelty is to be assessed vis-à-vis the whole disclosure of a prior art document, the examples being only a part thereof: it is therefore sufficient that the general part of the description of a prior art document discloses embodiments which are novelty destroying, even if the embodiments disclosed in the examples are not. Claim 1 of the main request lacked novelty over D15.

c) Selection on the basis of a general formula

In **T. 181/82** (OJ 1984, 401) the board confirmed that the products of processes which were the inevitable result of a prior description of the starting materials and the process applied thereto formed part of the state of the art. This was true even if one of the two reactants manifested itself as a chemical entity (C₁ alkyl bromide) from a group of generically defined compounds (C₁ - C₄ alkyl bromides). The board took the view that the description of the reaction of a certain starting material with C₁ to C₄ alkyl bromides disclosed only the C₁-

substituted product, and was not prepared to recognise the disclosure of a particular butyl substituent on the grounds that four isomeric butyl radicals existed.

In T. 7/86 (OJ 1988, 381) the board also based its reasoning on T. 12/81 (OJ 1982, 296), stating that the principle that a substance resulting from the reaction of a specific pair from two lists could nevertheless be regarded as new, was applicable not only to starting substances in chemical reactions but also to polysubstituted chemical substances where the individual substituents had to be selected from two or more lists of some length, such as in the case in question.

Following on from T. 181/82 (OJ 1984, 401) it was stated in T. 7/86 that if a class of chemical compounds precisely defined only in structural terms (by a chemical reaction), and with only one generically defined substituent, did not represent a prior disclosure of all the theoretical compounds encompassed by an arbitrary choice of a substituent definition, this clearly also had to be the case for a group of chemical substances, the general formula of which had two variable groups. Therefore, a class of chemical compounds defined only by a general structural formula having at least two variable groups did not specifically disclose each of the individual compounds which would result from the combination of all possible variants within such groups.

In T. 258/91 the case concerned a selection from two lists of starting compounds. The compound (formula VI) cited as taking away novelty from the patent in suit differed from the claimed compound (formula I) by the methyl residue on the amino group in the 4-position. In the board's judgment, the information in the cited document was not sufficient to disclose the compound of formula I to the skilled person in the form of a concrete, reproducible technical teaching. The board found that the cited document did not contain any teaching involving the modification of the compound, which was mentioned only by way of example. What was being taught was merely the preparation of a class of compounds and not of a specific, individual compound.

In T. 658/91 the board held that the case law did not suggest that a chemical compound was deemed to be specifically disclosed only if that compound was mentioned by name or even described in an example. On the contrary, it was sufficient if the compound could be unambiguously identified as envisaged in individualised form in the document in question, since the purpose of Art. 54(2) EPC 1973 was to exclude the state of the art from patentability.

6.2.2 Novelty of groups of substances

The case law on the novelty of generically defined compounds and particular examples of these was summarised in decision T. 12/90. The board had to consider the novelty of a vast family of chemical compounds defined by a general structural formula, where the prior art also disclosed a vast family likewise defined by a general structural formula, the two families having a large number of products in common. The board pointed out that a distinction had to be drawn between two situations:

(a) If the subject-matter of the invention was a particular compound, whereas the prior art disclosed a family of compounds defined by a general structural formula including this particular compound but not describing it explicitly, the invention had to be considered novel (see T 7/86, T 85/87, T 133/92).

(b) If, with the same prior art, the subject-matter of the invention was a second family of compounds partially covering the first, the invention was not new (see T 124/87).

As regards case (a) the board said: "That case is not comparable with the present one in which a distinction must be drawn between the novelty of a group of substances defined by a general formula and a second group of substances partially covering the first and defined by another general formula, because the **concept of individualisation** naturally only applies to the structural definition of a single compound, not a collection of compounds".

Case (b) was extensively discussed in T 124/87 (OJ 1989, 491). This decision dealt with the problem of assessing the novelty of a class of compounds defined by parameters within numerical ranges. The patent in suit claimed a class of compounds defined by parameters within numerical ranges while the prior document disclosed a process by which a class of compounds could be prepared – comprising those claimed in the patent in suit – having the combination of parameters required by the main claim of the latter. In that particular case, the example specifically described in the prior document did not disclose the preparation of any particular compounds within the class defined in the claims of the disputed patent. However, it had been accepted by the patentee that a skilled man would have no difficulty in preparing such compounds within the class defined by the claims of the disputed patent using the process described in the said prior document, in combination with his common general knowledge, so that the disclosure of the prior document had to be regarded as not only limited to the particular compounds whose preparation was described in the examples, but also as comprising the general class of compounds made available to the skilled man in that technical teaching, even though only certain compounds within this class were described as having been prepared. Since the compounds as defined in the claims of the disputed patent formed a major part of this general class, they formed part of the state of the art and therefore lacked novelty.

In T 133/92 the question to be answered in examining novelty was whether the selection of the alkyl group as defined in claim 1 of the disputed patent had been made available to the public with regard to the disclosure of a prior document. By citing T 666/89 (OJ 1993, 495), the patent proprietors contended that the legally correct approach for deciding selection novelty was identical or very similar to that employed in determining obviousness. In particular, they argued that in cases of overlapping ranges of compounds, a claim to a narrower range as compared with a broader prior art range was always selectively novel if it could be demonstrated that the narrow range was inventive over the broader range. However, the board observed that in the case cited the board had repeatedly emphasised that selection novelty was not different from any other type of novelty under Art. 52 and 54 EPC 1973, so that the proper approach was to consider availability in the light of a particular document. Thus the board found that a claimed group of compounds, essentially resulting from omitting those parts of a larger group of

compounds which a skilled person would have immediately considered as being less interesting than the rest, could not be selectively novel. In addition, in the board's opinion, a skilled person would, having regard to these considerations, have seriously contemplated applying the technical teaching of this prior art document in the range of overlap.

6.2.3 Novelty of enantiomers

According to decision **T.296/87** (OJ 1990, 195), the description of racemates did not anticipate the novelty of the spatial configurations contained in them; racemates were described in the state of the art by means of expert interpretation of the structural formulae and scientific terms; as a result of the asymmetric carbon atom contained in the formula the substances concerned might occur in a plurality of conceivable spatial configurations (D and L enantiomers), but the latter were not by themselves revealed thereby in an individualised form. That methods exist to separate the racemate into enantiomers was something that should only be considered with respect to inventive step.

In **T.1048/92** the board observed that the fact that the disclosure of the prior document did not embrace more than two possible steric configurations did not take away the novelty of the specific one which was claimed in the application, because there was no unambiguous technical teaching directed to that configuration. The novelty of such an individual chemical configuration could only be denied if there was an unambiguous disclosure of this very configuration in the form of a technical teaching. It was thus not sufficient that the configuration in question belonged conceptually to a disclosed class of possible configurations without any pointer to the individual member.

In **T.1046/97** it was decided that the term "optically-active forms" could not be equated to an individualised disclosure of a specific enantiomer (see also **T.833/11**).

6.2.4 Achieving a higher degree of purity

In **T.990/96** (OJ 1998, 489) it had to be examined whether the feature in dispute, which in fact represented a **specific degree of chemical purity** (in particular diastereomeric purity), constituted a "new element" imparting novelty to the claimed subject-matter. The board stated that it was common general knowledge that any chemical compound obtained by a chemical reaction would normally contain impurities for various reasons and that it was not possible for thermodynamical reasons to obtain a compound which was - in the strict sense - completely pure, i.e. totally free of any impurity. It was, therefore, common practice for a person skilled in the art of preparative organic chemistry to (further) purify a compound obtained in a particular chemical manufacturing process according to the prevailing needs and requirements. Conventional methods for the purification of low molecular organic reaction products, which could normally be successfully applied in purification steps, were within common general knowledge. It followed that, in general, a document disclosing a low molecular chemical compound and its manufacture made this compound available to the public within the meaning of **Art. 54 EPC 1973** in all grades of purity as desired by a person skilled in the art (**T.392/06**).

In T. 728/98 (OJ 2001, 319) the applicant (appellant) argued that the situation was such an exceptional one as mentioned in T. 990/96. The claimed pharmaceutical composition differed from the state of the art because the particularly high purity level of the compound it contained could not be achieved by conventional methods. The board found, however, that the applicant, who bore the burden of proving this allegation, had not provided the necessary evidence. Where the claimed purity level of a low molecular chemical compound (here a terfenadine derivative) turns out to be successfully achieved by applying a conventional purification method on a reaction mixture disclosed in the prior art, an exceptional situation such as addressed in decision T. 990/96 does not exist. This would have required evidence that conventional methods could not achieve that purity level. Therefore the general rule applies that the level of purity of that low molecular compound cannot entail novelty. That general rule is valid also in the case of a product-by-process claim where that purity level is the inevitable result of the preparation process indicated in the claim.

In T. 112/00 the board considered a composition including a solvent having a purity greater than 99% to be new over a prior art composition containing such a solvent whose purity was not specified. The board stated that the claimed composition could be considered as a final product and the solvent as the starting material. As in T. 786/00, novelty would be established by the defined purity of the starting material.

The issue in T. 803/01 was the novelty of a pharmaceutical composition which differed from prior-art compositions only in the degree of purity of one of its components. In the board's view each and every purification method, provided it was "conventional" but regardless of the extent of purification sought, was presumed to be automatically available to the public, and that in a fully enabling way, so as to amount to an effective novelty-destroying disclosure. As stated in T. 100/00 in this respect, the term "conventional" could only mean "conventional in view of the concrete technical context concerned". Therefore the question of whether the degree of purity for the polylactide required in claim 1 provided a new element over the prior art had to be assessed in the concrete technical context concerned.

In T. 142/06 the board noted that it followed from the considerations made in decision T. 990/96, according to which a document disclosing a low molecular compound and its manufacture normally makes this compound allowable in all desired grades of purity, that the purity level of an organic compound is as such not an essential feature for the definition of this organic compound. However, in the case at issue it was evident that the content of chlorine ion of the claimed latex was an essential feature of the claimed latex, since, according to the patent in suit, only the latexes having this low level of chlorine ions enabled the production of films having the desired properties in terms of oxygen barrier properties and boil blushing properties. This implied that the claimed degree purity in terms of chlorine ion content could not be considered as an arbitrary degree of purity but that it amounted to a purposive selection. Thus, for this reason the considerations made in decision T. 990/96 and, by way of implication, in decision T. 803/01, did not apply to the case before the board.

In T. 1085/13, the board decided that a claim defining a compound as having a certain purity lacks novelty over a prior-art disclosure describing the same compound only if the

prior art discloses the claimed purity at least implicitly, for example by way of a method for preparing said compound, the method inevitably resulting in the purity as claimed. Such a claim, however, does not lack novelty if the disclosure of the prior art needs to be supplemented, for example by suitable (further) purification methods allowing the skilled person to arrive at the claimed purity. The question of whether such (further) purification methods for the prior-art compound are within the common general knowledge of those skilled in the art and, if applied, would result in the claimed purity, is not relevant to novelty, but is rather a matter to be considered in the assessment of inventive step. Further, the board was convinced that the rationale of T 990/96 and T 728/98 was not in line with G 2/88 and G 2/10.

6.3. Selection of parameter ranges

6.3.1 Selection from a broad range

The principles applied by the boards of appeal as part of their established case law on the novelty of selection inventions were developed in particular in T 198/84 (OJ 1985, 209). They are summarised briefly in T 279/89, according to which a selection of a sub-range of numerical values from a broader range is new when each of the following criteria is satisfied:

- (a) the selected sub-range should be narrow;
- (b) the selected sub-range should be sufficiently far removed from the known range illustrated by means of examples;
- (c) the selected area should not provide an arbitrary specimen from the prior art, i.e. not a mere embodiment of the prior description, but another invention (purposive selection).

The Guidelines recall the three criteria (see G-VI, 8 (ii) – November 2018 version).

The three postulates for the novelty of a selected sub-range are based on the premise that novelty is an absolute concept. It is therefore not sufficient merely for the wording of the definition of an invention to be different. What has to be established in the examination as to novelty is whether the state of the art is such as to make the **subject-matter** of the invention available to the skilled person in a technical teaching (T 198/84, OJ 1985, 209; see also T 12/81, OJ 1982, 296; T 181/82, OJ 1984, 401; T 17/85, OJ 1986, 406).

With reference to the third criterion, the board in T 198/84 was of the opinion that this view of novelty really entailed more than just a formal delimitation vis-à-vis the state of the art. There would be delimitation only in respect of the wording of the definition of the invention, but not in respect of its content, if the selection were arbitrary, i.e. if the selected range only had the same properties and capabilities as the whole range, so that what had been selected was only an arbitrary specimen from the prior art. This was not the case if the effect of the selection, e.g. a substantial improvement in yield, occurred in all probability only within the selected range, but not over the whole known range (purposive selection). To prevent misunderstanding, the board emphasised, following T 12/81 (OJ 1982, 296),

that a sub-range singled out of a larger range was new not by virtue of a newly discovered effect occurring within it, but had to be new per se. An effect of this kind was not therefore a prerequisite for novelty; in view of the technical disparity, however, it permitted the inference that what was involved was not an arbitrarily chosen specimen from the prior art, i.e. not a mere embodiment of the prior description, but another invention (purposive selection).

With reference to the third criterion (criterion "(c)"), several decisions consider that purposive selection is relevant for assessing inventive step but not novelty (see T 1233/05, T 1131/06, T 230/07, T 913/07, T 1130/09, T 2041/09, T 492/10, T 1948/10, T 423/12, T 378/12, T 1404/14, T 261/15, some of which are reported below). However see for example decision T 66/12, in which the board left it open as to whether the first two criteria were satisfied in light of its conclusion that the third criterion was not met (conclusion – lack of novelty). See also the detailed decision T 673/12, which recalled the three criteria for the examination of novelty.

In T 17/85 (OJ 1986, 406) the novelty of the claimed range was denied because the preferred numerical range in a citation in part anticipated the range claimed in the application. A claimed range could not be regarded as novel, at least in cases where the values in the examples given in the citation lay just outside the claimed range and taught the skilled person that it was possible to use the whole of this range.

In deciding the question of the novelty of an invention, the board in T 247/91 emphasised that consideration had to be given not only to the examples but also to whether the disclosure of a prior art document as a whole was such as to make available to the skilled person as a technical teaching the subject-matter for which protection was sought. The board stated that a skilled reader of the cited document had no reason to exclude the range of 85 to 115°C claimed in the patent in suit when carrying out the invention disclosed in the citation. The teaching of the cited document was clearly not limited to the use of the exemplified temperatures, but extended to the whole described temperature range of 80 to 170°C which had been made available to the skilled person as a technical teaching. The subject-matter of the patent in suit lacked novelty.

In T 406/94 the board found that the percentage range cited in the prior art, although numerically close to the claimed range, could not be adduced to anticipate the subject-matter claimed, because the percentage cited in the prior art was based on different starting materials.

In T 610/96 the patentee claimed a magnetoresistive material comprising magnetic and non-magnetic metallic thin film layers. The board found that the claimed ranges defining the composition of these layers must be considered as a narrow selection of the generic disclosure of prior art document D10, which did not overlap with the sub-ranges preferred in D10 and which further selected a specific non-magnetic layer among a group of possible layers. This selection was also sufficiently far removed from the specific examples of D10. Furthermore, the claimed material showed different characteristics of the magnetoresistance change, so that the specific sub-range was not simply an arbitrary part of the generic disclosure of D10, but was of a different nature and therefore novel. The

criteria for selection inventions set out in T.279/89 were thus satisfied. In T.100/12 too, all three criteria were met.

In T.230/07 the board noted that novelty and inventive step are two distinct requirements for the patentability of an invention and therefore different criteria should apply for their assessment. So, the presence or absence of a technical effect within a sub-range of numerical values was not to be taken into account in the assessment of novelty. To establish novelty of a sub-range of numerical values from a broader range, the selected sub-range should be narrow and sufficiently far removed from the known broader range illustrated by means of examples. A sub-range is **not rendered novel by virtue of a newly discovered effect** occurring within it.

In T.1130/09 the "selection invention" principle had been applied in the contested decision for the purpose of assessing novelty, regard being had to the three criteria developed in T.198/84 (see OJ 1985, 209). The board observed that this principle was applicable where a narrow sub-range was selected from a broader range. The passage on page 9, lines 5 to 7, of document (2) disclosed that the dimensions of the structures were measured in nanometres or micrometres. Therefore, as had already been established in the contested decision, the range specifically claimed was a narrow selection which, in the absence of examples in document (2), had to be considered far removed from the central embodiments in that document. The board thus held that the first two of the criteria defined in T.198/84 were met. The **third** – that a technical effect of the narrower sub-range claimed had to be demonstrated – could not, however, be considered for the purpose assessing novelty, because novelty and inventive step were two distinct requirements for patentability. A technical effect within the more narrowly claimed range did not confer novelty on a numerical range which was already novel per se, but merely confirmed its already established novelty. Whether or not there was a technical effect nevertheless remained **a matter of inventive step** (many decisions have applied this approach; see T.1233/05, T.1131/06, T.230/07, T.913/07, T.2041/09, T.492/10, T.1948/10, T.423/12, T.378/12, T.1404/14 and T.261/15).

Indeed in T.378/12, concerning criterion (c), the board was of the view that purposive selection was relevant for assessing inventive step but not novelty. Consequently, since the claimed sub-range met the criteria (a) and (b), the board judged that the subject-matter of claim 1 was new.

In T.261/15 the board stated that in the case of an alloy composition, a disclosure of a combination of the different alloying elements within the claimed ranges is necessary for a finding of lack of novelty. Since the different alloying elements interact with each other to form precipitates and solid solutions, their content ranges were not to be considered in isolation but in combination. Regarding the limit values, the appellant (opponent) argued that these values were explicitly disclosed and that in order to recognise novelty of a sub-range selected from a broader numerical range of the prior art the selected sub-range had inter alia to be sufficiently far removed from the end-points of the known range (Guidelines G-VI, 8 (ii) (b) – November 2018 version). The approach taken by the appellant was an exercise in cherry-picking within the disclosure of D1, which created a novel combination of features that was not disclosed in D1. In respect of the argument above – recited as a

condition in the Guidelines for acknowledging novelty of a numerical selection – neither T 198/84 nor T 279/89 stipulates this condition. In the view of this board, the limit values of a known range, although explicitly disclosed, are not to be treated in the same way as the examples. And concerning criterion (c), which by contrast to the first two criteria (a) and (b), goes beyond the comparison of the invention defined in the claims with the disclosure of the prior art, because it considers the presence of an effect of the claimed invention, the board considered that whether the claimed selection was purposive or not was more a question of inventive step than of novelty. D1 was not novelty destroying.

In T 40/11 the board stated that it may be questioned whether the third criteria mentioned in T 198/84 (see above) has to be considered when assessing novelty.

6.3.2 Overlapping ranges

In decision T 666/89 (OJ 1993, 495) the board gave a ruling on novelty assessment in cases of overlapping numerical ranges. The patent related in particular to a shampoo comprising 8-25% anionic surfactant and 0.001-0.1% cationic polymer. In an earlier patent application a shampoo composition had been disclosed containing 5-25% anionic surfactant and 0.1-5.0% cationic polymer. The board held that the composition was not new. In the board's view, there was no fundamental difference between examining novelty in situations of so-called "overlap" or "selection", and in doing so in other situations, although it might be helpful, in order to verify a preliminary conclusion of a novelty examination in cases of overlap, to investigate whether or not a particular technical effect was associated with the narrow range in question. It needed to be stressed, however, that such a particular effect was neither a prerequisite for novelty nor could it as such confer novelty; its existence could merely serve to confirm a finding of novelty already achieved. The term "available" in Art. 54(2) EPC 1973 clearly went beyond literal or diagrammatical description, and implied the communication, express or implicit, of technical information by other means as well. Thus it was clear that matter that was hidden, not in the sense of being deliberately concealed but rather in the sense of being reconditely submerged in a document, would not have been "made available" in the above sense. In the case of overlapping ranges of physical parameters between a claim and a prior art disclosure, what would often help to determine what was "hidden" as opposed to what had been made available was whether or not a skilled person would find it difficult to carry out the prior art teaching in the range of overlap. Provided the information in the prior art document, in combination with the skilled person's common general knowledge, was sufficient to enable him to practise the technical teaching, and if it could reasonably be assumed that he would do so, then the claim in question would lack novelty. Novelty was carefully analysed on the basis of comparable considerations in T 366/90 and T 565/90.

Decision T 26/85 (OJ 1990, 22) suggested, as a specific test for determining whether a technical teaching had been made available to the public, posing the question whether the person skilled in the art would in the light of the technical facts **seriously contemplate** applying the technical teaching of the prior art document in the range of overlap. If it could be fairly assumed that he would do so, it had to be concluded that no novelty existed. This formulation of the question was adopted inter alia in T 279/89, T 666/89 (OJ 1993, 495), T 255/91 (OJ 1993, 318), T 369/91 of 7 October 1992, T 631/92 and T 660/93.

In **T. 751/94** the board regarded it as clear that the method according to the cited document was not to be carried out in the overlapping range, and consequently the overlap did not deprive the claimed invention of novelty. In addition, the combination of parameters in the claimed invention was not disclosed in, and was not clearly derivable from, the cited document.

In **T. 240/95** the appellant had argued that 0.5 to 60 minutes would not include 60 minutes as such inclusion would have to be worded "0.5 up to and including 60 minutes." The board held that, in accordance with established case law, disclosure of a range was considered to be an explicit disclosure of the end values.

In **T. 594/01** the board stated that it was common general knowledge that every experimental measurement in quantitative analytical chemistry as well as any result of any physical measurement could not be dissociated from the margin of uncertainty attached to the measurement. Normally, the uncertainty of a measured experimental value was irrelevant for the assessment of novelty. However, when a specific experimental value was disclosed in an example of prior art, seeking to distinguish the claimed subject-matter therefrom only in terms of an upper limit to be required to be "lower than" the experimental value must fail, as the claimed subject matter is still not distinguishable from the prior art within the margin of experimental error (see also **T. 708/05**).

In **T. 1115/09** D1 disclosed that the gas at the outlet of the catalytic bed contained no more than about 10 ppm oxygen, i.e. a range of oxygen concentrations ending with the upper value of "about 10 ppm". According to the boards' established case law (see **T. 240/95**), the disclosure of a range was an explicit disclosure of the end values. In the case at issue, it followed by analogy that the end value "about 10 ppm" was explicitly disclosed in D1. The question to be answered was whether this end value fell within the range defined in claim 1 at issue, i.e. "more than 10 ppm oxygen and up to 250 ppm". In the board's view, in the absence of a clear definition in document D1 of the relative term "about", the expression "about 10 ppm of oxygen" was to be given its broadest meaning, namely "10 ± epsilon ppm of oxygen". As the value "10+epsilon" was synonymous with the value "more than 10", the choice of the latter as the lower end of the range defined in claim 1 thus boiled down to the selection of one discrete value within the list of three disclosed in D1: "10-epsilon", "10" and "10+epsilon". The board referred to **T. 730/01**, according to which the selection of one item within one single list of equivalent alternative items did not confer novelty, concluded that the disclosure of document D1 inevitably led to subject-matter falling within the scope of protection of claim 1.

In **T. 1571/15** the overlap between the composition as claimed and the broad composition of D1 was narrow. D1 disclosed a preferred composition range and there was no pointer to work outside this range. The board stated that while it was true that the person skilled in the art might seriously contemplate working in the centre region of a prior art range when no other pointer (for instance in the form of examples of preferred ranges) to another region was present, this was no longer true if, as in the present case, such a pointer was present and was directed to another region.

6.3.3 Multiple selection

In T. 245/91 the patent proprietors contended that the subject-matter of claim 1 amounted to the purposeful selection of a small area from the very broad disclosure in the document. The board observed that most of the ranges in claim 1 of the patent in suit could be obtained by narrowing down the ranges according to the cited document by approximately 25 to 80% and restricting them to their central portion, and that in a situation like this, where several ranges of parameters were to be considered, a careful comparison had to be carried out in order to assess whether or not the subject-matter of the claimed invention was available to the skilled person. Any obviousness considerations were to be strictly avoided. Referring to T. 666/89 (OJ 1993, 495), the board emphasised that, under the Convention, novelty had to be decided by reference to the total information content of a cited prior art document. In the board's judgment, the combination of the relevant features would not have been seriously contemplated by the skilled reader and was not made available to him, because the said features were not prominent in the cited document and did not therefore lend themselves to an unambiguous, implicit disclosure. A further point to consider was the number of parameters used to define the claimed subject-matter, since each of the ethylene polymers was characterised by several parameters. The board held that, even if most of the ranges for these parameters corresponded to a more or less central portion of the range which limited the corresponding parameter in the composition according to the cited document, as a result of the number of parameters involved, which exceeded ten, the scope of the claimed blends was in reality quite narrow with regard to the breadth of the definition of the known composition. This was also the reason why the argument that there had been an implicit description of this narrow selection in the prior document was not accepted (see also T. 440/04, T. 1196/05).

In case T. 653/93 the appellant argued that the process of claim 1 was novel as it referred to a combination of three process features with selected ranges and product features with specific limits, a combination not disclosed in the prior art document. The board of appeal emphasised that in such situations the question of novelty could not be answered by contemplating the ranges of the various parameters separately. This would, in the board's judgment, be an artificial and unjustified approach, since it was not the specified ranges of the three parameters or their agglomeration that formed the subject-matter of claim 1, but the group of processes defined by the combination of these ranges, which was rather small when compared with the group of processes disclosed in the prior art document. Thus the claimed group of processes, characterised by the combination of three specific process parameters, was not explicitly disclosed in the prior art document and therefore could be said to result from a "multiple (i.e. threefold) selection". The novelty of the technical teaching of claim 1 was corroborated by experimental evidence showing that the products resulting from the claimed processes could not have been obtained by processes which were close to but nevertheless outside the range of the processes claimed. It followed that the subject-matter of claim 1 was not considered as having been disclosed in the prior art document.

In T. 65/96 there was no mention in prior art document D2 of a rubber-reinforced copolymer having the combined features forming the solution of the technical problem addressed in the opposed patent. The board pointed out that the argument of the appellant (opponent)

that all the relevant parameters had been mentioned "within a few lines" was irrelevant, because the location within the document of a disclosure did not in itself suffice to show the true contextual relationship of the parameters, let alone establish that they were disclosed in combination, as required by the solution of the technical problem. In any case, one of the parameters was referred to in a quite separate section of the disclosure. Furthermore, closer examination of D2 showed that the parameters relating to the amount of rubber and the particle size of rubber, were merely disclosed as independent ranges without any indication as to how, or indeed whether, they might vary in relation to one another. Whilst it was conceded by the respondent at the oral proceedings that D2 disclosed ranges partly overlapping with those defined in the solution of the technical problem, the latter required the simultaneous fulfilment of three values of the same parameters. The board came to the conclusion that the claimed solution was not arbitrary since it solved a specific technical problem compared with the products according to D2. Hence, the claimed solution, to the extent that it overlapped at all with the general disclosure of D2, represented a narrow selection therefrom and fulfilled all the requirements of a true selection (see T 198/84, OJ 1985, 209).

In T 1834/13 the appellant argued that D7 destroyed the novelty of claim 1 because it described all its features, which meant that an embodiment, although not literally disclosed, had been made publicly available (implicit disclosure). Conceding that there was some overlap, the board nonetheless held that, although D7 encompassed the tapes according to claim 1 as a concept, it did not disclose them directly and unambiguously. The subject-matter of claim 1 was a specific combination resulting from a multiple selection from among the alternatives proposed in D7 but there was no incentive in D7 to choose that combination. T 198/84 and T 65/96 did not apply because they did not concern multiple selections.

6.4. Subject-matter group

T 763/89 considered the issues raised by making a selection from a generically defined group of multilayer materials. The patent related to a reversal colour photographic material comprising three layers having differing colour sensitivity, each layer comprising a further three layers having the same colour sensitivity but differing photographic sensitivity. The closest prior art consisted of a reversal material with "at least two" layers. The opponent had argued that the multilayer materials disclosed by this prior art also included the three-layer material claimed, therefore causing lack of novelty. The board, however, held that it was new: although "at least two" was synonymous with a multilayer material and set the lower limit in the form of a double-layer material (the description related to any multilayer material without specifying an upper limit for the number of possible layers), the only theoretical examples given for such multilayer materials were double-layer materials. Nor did the documents cited in support of the opposition as much as hint at a three-layer material. It might appear logical for a three-layer material to form part of the group of multilayer materials in the cited documents, but this did not mean that it was thereby disclosed. On the contrary, it was a new material forming part of this group and selected from it. The board handed down this ruling in the context of previous case law on selection inventions involving chemical substances. This had provided that a technical teaching was prejudicial to novelty if it disclosed a substance in individualised form, i.e. one clearly

distinguishable from structurally similar substances. This principle for assessing the novelty of individuals as distinct from a group could be applied to things such as the photographic material in question, which was clearly distinguishable from other things forming part of the same generically described group.

7. First and second medical use

7.1. First medical use

7.1.1 Introduction

Under Art. 53(c) EPC methods for treatment of the human or animal body by surgery or therapy and diagnostic methods practised on the human or animal body ("medical methods") are excluded from patentability; this provision shall not apply to products, in particular substances or compositions, for use in any of these methods.

Art. 54(4) EPC (former Art. 54(5) EPC 1973) provides that the general rules of law relating to novelty do not exclude the patentability of any substance or composition, comprised in the state of the art, for use in a method referred to in Art. 53(c) EPC (former Art. 52(4) EPC 1973), provided that its use for any method referred to in that paragraph is not comprised in the state of the art. Thus in addition to the general concept of novelty, this article introduces, in respect of substances and compounds used in surgical and therapeutic treatment and in diagnostic processes carried out on humans and animals, a **special concept of novelty** unknown in other technical fields (T.128/82, OJ 1984, 164).

The new Art. 54(4) EPC, which corresponds to the former Art. 54(5) EPC 1973, was not intended to introduce any fundamental change. Both provisions relate to what is known as a "first medical indication of a per se already known substance or composition" (G.2/08, OJ 2010, 456). Either a product for use in a method under Art. 53(c) EPC is new per se and can be the subject-matter of a product claim under Art. 53(c), second sentence, EPC or a product (substance or composition) is already known per se but can nevertheless be patented under Art. 54(4) EPC, provided it has not yet been used in a method under Art. 53(c), first sentence, EPC. The first medical indication of a known substance or composition is generally the object of broad generic claims in the form of **use-related product claims**. In G.5/83 (OJ 1985, 64) the Enlarged Board observed that the inventor of a "first medical indication" could obtain purpose-limited product protection for a known substance or composition, without having to restrict himself to the substance or composition when in a form technically adapted to a specified therapeutic purpose. The appropriate protection for him was, therefore, in its broadest form, a purpose-limited product claim.

Accordingly, under Art. 54(4) EPC, known substances or compositions are deemed to be new, provided they are used for the first time in such a medical method. According to the case law of the boards of appeal, the first to show a use of a substance or composition in a medical method should receive broad protection covering any use in a medical method, even if only one specific use is disclosed in the application (see T.128/82, OJ 1984, 164; T.36/83 OJ 1986, 295).

7.1.2 Scope of a purpose-related product claim

In T 128/82 (OJ 1984, 164) the board considered the question of a first medical indication with regard to the breadth of the purpose-related product claim. The examining division had refused the application on the grounds that it failed to fulfil the requirements of Art. 52(4) and 54(5) EPC 1973 (now Art. 53(c) and 54(4) EPC), as the claims were not limited to the specific therapeutic use of the known compounds as first discovered. The board had to consider whether the broad version of the claims was allowable having regard to Art. 54(5) EPC 1973 and, in particular, whether the EPC 1973 offered a basis for a limited statement of therapeutic purpose susceptible of narrow interpretation. In the opinion of the board the EPC 1973 neither prohibited nor required an unlimited statement of purpose. It held that Art. 54(5) EPC 1973 permitted a purpose-limited substance claim stating a general therapeutic purpose and found that where a known compound was for the first time proposed and claimed for use in therapy, the fact that a specific use was disclosed in the specification did not in itself call for a restriction of the purpose-limited product claim to that use (see also T 43/82 and T 36/83, OJ 1986, 295).

The board noted that under Art. 54(5) EPC 1973 a compound which was known but not used therapeutically was to be regarded as novel. Novelty, however, was not only destroyed by the fact that the same specific therapeutic effect was already known in the art, but suffered also from the disclosure of any other specific therapeutic application. The disclosure of any specific effect, therefore, always had the same consequences as far as novelty was concerned – which in turn made it fair to regard as admissible a broad statement of purpose covering all and any specific indications.

7.1.3 Protection of a preparation in the form of a "kit-of-parts"

It is the boards' settled case law that a "kit-of-parts" described the juxtaposition of separate but functionally interacting individual components.

In T 9/81 (OJ 1983, 372) the board held that combined preparations, the individual components of which represented known therapeutic agents, might be protected in a formulation corresponding to Art. 54(5) EPC 1973 (now Art. 54(4) EPC) even when claimed as a kit-of-parts, providing those components formed a functional unity (true combination through a purpose-directed application). Claim 1 referred to a combined preparation containing an oxazaphosphorin cytostatic agent and the sodium salt of 2-mercapto-ethane-sulphonic acid as therapeutic active ingredients. The first-mentioned component of the product was known, and the second was a known mucolytic agent. According to the documentary prior art available to the board, the two active ingredients had never been used together for a **new joint effect** and were **unknown as a composition**. The active ingredients which were administered preferably at the same time according to the invention did not therefore represent a mere aggregate of known agents, but a new combination with the surprising, valuable property that the severe side-effects to be expected when administering the cytostatic agents were absent as a result of the detoxifying effect of the sodium 2-mercapto-ethane-sulphonate.

7.1.4 Further technical information as compared with the state of the art

In T 1031/00 claim 1 was directed to the first medical use of (-) amlodipine, namely the treatment of hypertension. However, the prior art document already showed the ability of (-) amlodipine to inhibit calcium ion influx into rat aorta tissue in vitro as indicative of its effectiveness in the treatment of hypertension. It also disclosed that amlodipine was then undergoing phase III clinical trials for the treatment of hypertension. The board found that the description **provided no further evidence or data** showing the actual antihypertensive effect of the (-) isomer of amlodipine in humans or animals than did the prior art. The board concluded that the subject-matter of the patent application was anticipated by the disclosure in that document; in other words, document (3) disclosed the same medical use as the application at issue.

7.2. Second (or further) medical use

7.2.1 Introduction

A substance or composition for which a first medical use is already known may nevertheless be patentable under Art. 54(5) EPC for a second or further use in a method under Art. 53(c) EPC if that use is novel and inventive. According to G 5/83 (OJ 1985, 64), a further medical use claim is a claim directed to the use of a substance or composition for the manufacture of a medicament for a specified therapeutic application. Such a claim is novel if the therapeutic application, i.e. the therapeutic effect obtained by the claimed use, is novel. The Enlarged Board explained the legal and historical background to the patentability of further medical uses in G 2/08 (OJ 2010, 456).

Under the EPC 1973 a patent for a further medical application could, pursuant to a line of case law first set out in decision G 5/83 (OJ 1985, 64), be granted for a claim directed to the use of a substance or composition for the manufacture of a medicament for a specified therapeutic application ("**Swiss-type claim**"). The novelty of the subject-matter of such a claim could be derived not only from the novelty of the substance or of the method of manufacture, but also from the new therapeutic application (G 5/83). This "special approach to the derivation of novelty" constituted a narrow exception to the general novelty requirement and was not to be applied in other fields of technology.

Under Art. 54(4) EPC (former Art. 54(5) EPC 1973), known substances or compositions are deemed to be new, provided they are used for the first time in such a medical method ("first use in a medical method"). In the early 1980s, the Enlarged Board of Appeal was asked to decide whether any further medical use could receive patent protection under the EPC in spite of the wording of Art. 54(5) EPC 1973 (now Art. 54(4) EPC) which seemed to limit patentability to the first medical use. The Enlarged Board extended the notional novelty provided for in former Art. 54(5) EPC 1973 to apply to each further medical use in the so-called "Swiss type claim", i.e. to a claim "directed to the use of a substance or composition for the manufacture of a medicament for a specified new and inventive therapeutic application" (G 5/83, OJ 1985, 64; Legal Advice from the Swiss Federal Intellectual Property Office, OJ 1984, 581).

During the course of the revision of the EPC 2000, former Art. 54(5) EPC 1973 ("first use in a medical method") was renumbered to become Art. 54(4) EPC and a new Art. 54(5) EPC was introduced to provide protection for second medical uses. The new Art. 54(5) EPC eliminates any legal uncertainty on the patentability of further medical uses. It unambiguously permits purpose-related product protection for each further new medical use of a substance or composition already known as a medicine.

Claims to a second medical use would be drafted as product claims relating to a specific second or further medical use (see T. 1599/06).

In T. 1314/05, the board stated that decision G. 5/83 made it quite clear that its special approach to the derivation of novelty was applicable only to inventions or claims relating to the use of substances or compositions in a method of treatment referred to in Art. 52(4) EPC 1973, where that method did not yet form part of the state of the art. The board decided that G. 5/83 did not imply that the special approach to novelty assessment which was associated with the Swiss-type claim for substances or compositions could be applied to the use of a device to produce an appliance intended for medical purposes. Extension of that special approach to the production of such appliances ran counter to the general legal principle that exceptions are to be construed narrowly. This was confirmed by the fact that the EPC 2000 legislator in Art. 54(5) EPC expressly restricted the exception concerning the second medical use to substances or compositions.

The board in T. 1099/09 found that it followed clearly and directly from the EPC that Art. 54(4) and (5) EPC applied only to products which were substances or compositions and that no other products were patentable under them. The therapeutic effect of a medicinal product usually resulted from at least one substance or composition used in it and generally known as its active ingredient.

In T. 1758/07 the board stated that G. 5/83 only applies to second (and further) medical indications. It followed from this that the legal fiction behind G. 5/83, namely that the therapeutic treatment according to Art. 52(4) EPC 1973 was a limiting feature, was applicable only if a therapeutic treatment was indeed a second (or further) medical indication. If, however, the claimed subject-matter related to the first medical indication, G. 5/83 provided no legal basis for additionally claiming the same subject-matter as a second medical indication.

In G. 2/08 (OJ 2010, 456), the Enlarged Board of Appeal considered the consequences of the revised EPC for claims in the Swiss-type format. It decided that, where the subject-matter of a claim is rendered novel only by a new therapeutic use of a medicament, such claim may no longer have the format of a so-called Swiss-type claim as instituted by decision G. 5/83 (OJ 1985, 64). As Art. 54(5) EPC now permits purpose-related product protection for any further specific use of a known medicament in a method of therapy, the loophole existing in the provisions of the EPC 1973 is now closed – when the reason for the law ceases, the law itself ceases. In view of the fact that patents had been granted for claims of this (Swiss) type and many applications seeking such patent protection were still pending, the Enlarged Board considered that a transitional arrangement was necessary to ensure legal certainty and to protect the legitimate expectations of applicants. It therefore

set a time limit of three months from publication of its decision in the Official Journal of the EPO for future applications to comply with the new situation. In this respect the relevant date for future applications was ordered to be their date of filing or, if priority had been claimed, their priority date.

G 2/08 is discussed in further detail in this chapter [I.C.7.2.4 e](#)) "New dosage regimen".

For the "Formulation of claims under the EPC 1973", see "Case law of the Boards of Appeal of the EPO", 6th edition 2010.

7.2.2 Transitional provisions

According to Art. 1, No. 3 of the Decision of the Administrative Council of 28 June 2001 under Art. 7 of the Act revising the EPC of 29 November 2000, revised [Art. 54\(5\) EPC](#) is applicable to European patent applications pending at the time of the EPC 2000's entry into force, insofar as a decision on the grant of the patent has not yet been taken (see decision [T 1127/05](#), [T 406/06](#), [T 1599/06](#); see also OJ SE 4/2007).

[Art. 54\(5\) EPC](#) was introduced into the Convention as part of the revision of the EPC. Under the transitional provisions for EPC 2000, [Art. 54\(5\) EPC](#) shall apply to pending applications in so far as a decision on grant has not been taken ([T 1599/06](#) and [T 1127/05](#)).

In [T 1599/06](#) the board considered it already necessary to take the new situation under the EPC 2000 into account when examining the claims at issue. Claim 1 was interpreted as a product claim for a second medical use in accordance with [Art. 54\(5\) EPC](#) (see also [T 385/07](#), a case involving similar circumstances).

7.2.3 Purpose-limited product claims and Swiss-type claims – scope of protection

In [T 1780/12](#) the board examined in the context of the issue of double patenting whether the subject-matter of a claim directed to a new medical use of a known compound was the same, irrespective of whether the claim was in the "Swiss-type" format or in the format according to [Art. 54\(5\) EPC](#). The decision related to a divisional application with a main claim in the form of a purpose-limited product claim under [Art. 54\(5\) EPC](#). Claim 1 of the parent application was granted in the "Swiss-type" format. The examining division held that the claims of the parent and the divisional applications were directed towards the same subject-matter "in the sense that both these claims concern the same invention claimed in a different format." It refused the application on the basis that double patenting was prohibited. The board held that there was no double patenting. The decisive issue was whether the claims of the patent granted on the divisional and that granted on the parent had the same subject-matter. The category of a claim and its technical features constitute its subject-matter and determine the protection conferred (see [G 2/88](#), OJ 1990, 93). The claims in question were of different categories: Swiss-type claims were purpose-limited process claims (use of X for the manufacture of a medicament for the treatment of Y) and claims formulated in accordance with [Art. 54\(5\) EPC](#) were purpose-limited product claims (X for use in the treatment of Y). As regards the technical features, the board concluded that both sets of claims defined the same compound and the same therapeutic

use, but that the Swiss-type claims comprised in addition the feature of manufacturing a medicament whereas the claim in accordance with Art. 54(5) EPC did not. The claimed subject-matter was thus different. This outcome has been followed in decision T 879/12. As regards the scope of protection, the board considered that a purpose-limited process claim, such as a Swiss-type claim, also conferred less protection than a purpose-limited product claim, such as a claim in accordance with Art. 54(5) EPC (see also T 13/14; for further details with regard to the scope of protection, see chapter II.F.5. "Double patenting").

In T 1570/09 the set of claims of the main request contained two independent claims, claim 1 in Swiss-type form and claim 4 as a purpose-limited product claim under Art. 54(5) EPC. The claims aimed to seek protection for one and the same medical use of one and the same active drug. The purpose-limited product claim 4 sought protection for the same medical indication of the same substance as the Swiss-type claim 1, and the notional novelty of claim 1 was not derived from the "medicament" itself. The board stated that there was no longer an objective reason for justifying the simultaneous presence of both claims in the set of claims to be proposed for grant. Allowing such a set of claims would cause the contradictory legal situation that the old provisions in Art. 54 EPC 1973 together with Art. 52(4) EPC 1973, and the new provisions in Art. 54 EPC together with Art. 53(c) EPC, would apply simultaneously to one and the same set of claims. Art. 54(5) EPC applied to the case at issue and thus the purpose-limited product claim 4 of the main request was allowable in view of a new medical indication of a known substance. The Swiss-type form was conceived as an exception under the old law (EPC 1973). Therefore, in the board's view, there was no longer any legal reason for allowing Swiss-type claim 1 in the set of claims of the main request. Accordingly, the main request was not allowable.

In T 1021/11 too, the main request comprised two independent claims for the same medical indication of the same substance, one claim drafted in the Swiss-type format and the other claim following the provisions in Art. 54(5) EPC. The application had been pending when decision G 2/08 (OJ 2010, 456) was issued and therefore belonged to the category of applications in which the Swiss-type format could, as a general rule, still be used. As both claim formats were available for the application and claims in both formats were present in the main request, the question arose whether both claim types could be present in a single set of claims. The board concurred with the conclusion reached in T 1570/09 that decision G 2/08 did not give applicants an absolute right to draft two independent claims in one single set of claims for one and the same medical indication of one and the same substance, one of those claims being in the Swiss-type format and the other in the format in accordance with Art. 54(5) EPC. However, it appeared to the board that no prohibition of the coexistence of such claims in one claim set could be deduced from G 2/08 either, as it was silent in this respect. Having carefully examined the reasoning given in decision T 1570/09, the board found that several factors prevented it from objecting to the presence of claims in the two formats in one single set of claims in the case before it. Firstly, it noted that a single set of claims could be governed by provisions of the EPC 1973 and the revised EPC at the same time. Secondly, the continued existence of the Swiss-type format, in parallel to the provisions of Art. 54(5) EPC, was a direct consequence of the transitional arrangement provided for by the Enlarged Board in

decision G. 2/08. Thirdly, the board saw no reason to prevent an applicant from choosing both available formats during the interim period and considered it justified to do so in one set of claims. Even though the claims in both formats provided patent protection for the same medical indication, there was a difference in the subject-matter of the claims due to their category, in combination with their technical features (see above T. 1780/12, T. 879/12). Thus, by filing two patent applications having the same effective date (two parallel applications or parent/divisional or priority/subsequent application) it was possible for an applicant to obtain patent protection for the same second or further medical indication in both available claim formats. The board therefore did not object to the presence of both formats in a single set of claims, as both formats were applicable to the present application. The board noted that no objections had been raised in similar previous cases (see T. 396/09 and T. 1869/11), even if the issue had not been discussed in those decisions.

7.2.4 Novelty of the therapeutic application

a) General

The cases decided following decision G. 5/83 throw some light on the categories of novel and inventive therapeutic use for which the manufacture of a known substance or compound may be considered patentable. Manufacture of a known composition has been considered patentable for use in a new therapy where the target group to be treated was different (seronegative pigs instead of seropositive pigs; T. 19/86, OJ 1989, 25), and in the case of a new therapy with a different technical effect (prevention of tooth decay by means of a known substance, but by removing plaque instead of by reducing the solubility of tooth enamel; T. 290/86, OJ 1992, 414) or a new therapy with a different mode of administration (subcutaneous instead of intramuscular injection; T. 51/93).

b) New therapeutic application based on the group of subjects to be treated

According to the established case law of the boards of appeal, the use of the same compound in the treatment of the same disease for a particular group of subjects, can nevertheless constitute a novel therapeutic application, provided that it is carried out on a new group of subjects which is distinguished from the former by its physiological or pathological status (see T. 19/86, OJ 1989, 24; T. 893/90, T. 233/96, T. 1399/04, T. 734/12).

In T. 19/86 (OJ 1989, 25) the board had to decide whether the application of a known medicament for the prophylactic treatment of the **same disease** in an **immunologically different** population of animals of the same species could be considered a new therapeutic application from which novelty for the claims could be derived. According to decision T. 19/86 the question of whether a new therapeutic use was in accordance with decision G. 5/83 should not be answered exclusively on the basis of the ailment to be cured but also on the basis of the subject (in the case in question, the new group of pigs) to be treated. A therapeutic application was incomplete if the subject to be treated was not identified; only a disclosure of both the disease **and** the subject to be treated represented a complete technical teaching. The proposal according to the application to protect animals which could not hitherto be protected from the disease in question, by intranasally

administering to them a known serum, could not be considered disclosed in the prior art and therefore constituted a novel therapeutic application in accordance with G 5/83.

In T 233/96 the board held that if the use of a compound was known in the treatment or diagnosis of a disease of a particular group of subjects, the treatment or diagnosis of the same disease with the same compound could nevertheless represent a novel therapeutic or diagnostic application, provided that it was carried out on a new group of subjects which was **distinguished** from the former **by its physiological or pathological status** (T 19/86, OJ 1989, 25; T 893/90). This did not apply, however if the group chosen overlapped with the group previously treated, or the choice of the novel group was arbitrary which meant that no functional relationship existed between the particular physiological or pathological status of this group of subjects (here humans who were unable to exercise adequately) and the therapeutic or pharmacological effect achieved.

c) New technical effect

In decision T 290/86 (OJ 1992, 414) the board considered the claimed invention new. The grounds for its decision were as follows: "When a prior document and a claimed invention are both concerned with a similar treatment of the human body for the same therapeutic purpose, the claimed invention represents a further medical indication as compared to the prior document within the meaning of decision G 5/83 if it is based upon a different technical effect which is both new and inventive over the disclosure of the prior document". In this case the technical effect considered new was the removal of dental plaque, whereas the prior art only disclosed the depression of enamel solubility in organic acids (see also T 542/96 and T 509/04).

In T 836/01 the board accepted that claims directed to the use of IL-6 to directly influence tumour growth and differentiation were novel over a prior art disclosure of the use of IL-6 to indirectly treat cancer by activating T cells, finding that a new technical effect resided in the medical indication of the treatment of cancer vs. enhancement of the immune system. Applying the principles of decision G 5/83 (OJ 1985, 64), the board concluded that the technical effect relied upon in the claimed invention identified a **new clinical situation**. Since a new clinical situation was inseparable, as an abstract concept, from a patient suffering under it, it had to be concluded that this new clinical situation also identified a new sub-group of subjects being treated (T 1642/06).

In T 2251/14 the board referred to T 836/01 and stated that a second medical use of a known substance can only be considered novel if the new technical effect leads to a truly new industrial/commercial application arising from the healing of a different clinical situation. It held that in the case in hand, the new technical effect of "enhancing the balance of beneficial and deleterious bacteria in the gastrointestinal tract of an animal having or at risk for inflammatory bowel disease (IBD)" defined a new medical use, since the claimed new technical effect identified a new clinical situation, namely one where it was possible to target the gastrointestinal flora of an animal having or at risk for IBD.

In T 1955/09, the board needed to decide whether the use claimed represented a further and different therapeutic use from the disclosure in document (D1). It stated that the

conclusion could not be drawn that the technical effect relied upon by the claimed invention, i.e. the antibiotic effect, was a mere explanation of how the compounds inhibited or neutralised toxins. Rather, this effect identified a new clinical situation, namely one in which it could be preferable to target the infection itself, not merely the toxins produced by the bacteria or fungi causing the infection. The board decided that this reasoning was based on the differentiation of a direct and indirect effect on claims relating to second or further medical uses of a known substance (see above T 836/01 and T 1642/06). In view of the foregoing, the board was satisfied that the subject-matter of claim 1 at issue fulfilled the requirements of Art. 54(1) and (3) EPC vis-à-vis the disclosure in document D1.

In T 1972/14, the claim in question was a Swiss-type claim directed to the preparation of a certain infant formula so as to continuously reduce the circulating level of IGF-1 in the first few months of the life of an infant and thereby reduce the risk of development of obesity later in life. Reducing the risk of developing obesity later in life represented the therapeutic effect to be achieved, while the continuous reduction of the circulating level of IGF-1 represented the mechanism underlying this effect. A Swiss-type claim can derive novelty from the claimed therapeutic effect, but not from the mechanism underlying it. The prior art used the same formulation and the board held that the effect was thereby disclosed since the prior art in question started from the premise that there was a link between reduced protein content and obesity later in life.

d) Same illness

In T 108/09 the claims were drafted in the second medical use format according to decision G 5/83. The board noted that according to decision G 2/08 (OJ 2010, 456), Art. 54(5) EPC does not exclude a medicament already known to be used in the treatment of an illness from being patented for use in a different treatment by therapy of the same illness. It considered it appropriate to evaluate whether the breast cancer of claim 1 as granted was identical to the breast cancer according to document D2. The board noted that the tumours of document D2, being only resistant to tamoxifen, could be distinguished from the tumours of claim 1 as granted, which were additionally resistant to an aromatase inhibitor. This distinction meant that in the case at issue two different diseases or two subsets of a disease (tumour) were concerned. As a consequence, in analogy to the findings in T 893/90, the board established novelty. The subject-matter of claim 1 as granted was therefore novel over D2.

e) New dosage regimen

Some boards of appeal have considered recognising specific therapeutic uses as patentable in principle to be problematic where they differ from the prior art merely in terms of the dosage regimen. In G 2/08 (OJ 2010, 456), the Enlarged Board addressed this issue in detail.

With reference to the case law and the danger of a collision with Art. 52(4) EPC 1973, decision T 584/97 denied patentability for a claim directed essentially to the administration of nicotine in increasing doses. In T 317/95, T 56/97 and T 4/98 (OJ 2002, 139) the issue was discussed, with answers tending towards the negative, but ultimately left undecided.

In all of these cases, the grant of a patent would anyway have been refused on other grounds – i.e. lack of novelty or inventive step – so that the outcome of a decision on this issue was immaterial (see also T 1319/04, OJ 2009, 36)

In T 1319/04 (OJ 2009, 36), the board referred to the Enlarged Board of Appeal the question whether medicaments for use in methods of treatment by therapy, where the only novel feature was a dosage regime, are patentable under Art. 53(c) and 54(5) EPC. The Enlarged Board answered in G 2/08 (OJ 2010, 456) as follows:

1. Art. 54(5) EPC does not exclude a medicament which is already used in the treatment of an illness being patented for use in a different treatment by therapy of the same illness. Art. 53(c) EPC, which lists as an exception to patentability 'methods for treatment of the human body ... by therapy' is clear and unambiguous, and draws a borderline between unallowable method claims directed to a therapeutic treatment on the one hand and allowable claims to products for use in such methods on the other. The two concepts of a method of treatment by therapy and of a product to be used in such a method are so close to each other, that there is a considerable risk of confusion between them unless each is confined to its own domain as allocated to it by the law. Art. 53(c), second sentence, EPC, is not therefore to be interpreted narrowly; on the contrary, it is appropriate to give both provisions (Art. 54(5) and Art. 53(c) EPC) the same weight and conclude that, in respect of claims directed to therapy, method claims are absolutely forbidden in order to leave the physician free to act unfettered, whereas product claims are allowable, provided their subject-matter is new and inventive. By virtue of a legal fiction, Art. 54(4) and (5) EPC acknowledge the notional novelty of substances or compositions even when they are already comprised in the state of the art, provided they are claimed for a new use in a method which Art. 53(c) EPC excludes from patent protection. The notional novelty, and thus, non-obviousness, if any, is not derived from the substance or composition as such, but from its intended therapeutic use. Art. 54(5) EPC refers to "any specific use" [emphasis added] and thus, in conjunction with the stated intention of the legislator to maintain the status quo of the protection evolved in the case law of the boards of appeal under G 5/83 (OJ 1985, 64) in this respect, this use cannot be ex officio limited to a new indication stricto sensu (approving T 1020/03, OJ 2007, 204).

2. The Enlarged Board went on to hold that such patenting is also not excluded where a dosage regime is the only feature claimed which is not comprised in the state of the art. Given the answer to the first question, and, since Art. 54(5) EPC may be used in cases of the treatment of the same illness, the "specific use" in the sense of that provision may reside in something other than the treatment of a different illness, the Enlarged Board held that there is no reason to treat a feature consisting in a new dosage regime of a known medicament differently from the one given to any other specific use acknowledged in the case law. However, it stressed that the whole body of jurisprudence relating to the assessment of novelty and inventive step also applies. The jurisprudence on this continues to apply (see T 290/86; OJ 1992, 414; T 1020/03, OJ 2007, 204; T 836/01; T 1074/06).

In T 1020/03 (OJ 2007, 204) a pure dosage regimen was for the first time recognised as not excluded from patentability. The claims were directed to the use of insulin-like growth factor-I in the preparation of a medicament for administering to a mammal in a specific

discontinuous administration pattern. In the headnote, the board stated that any use to which Art. 52(4) EPC 1973, first sentence, applies in circumstances where the composition has already been suggested for some therapeutic use, allows a second medical use claim to the preparation of the composition for that second medical use, irrespective of in what detail that use was specified, subject to the use being novel and inventive. For the purposes of novelty also under Art. 54(5) EPC this depends on whether use for therapy is novel, irrespective of the detail with which the therapy is stated in the claim.

f) New therapy with a different mode of administration

In T. 51/93 the only difference between the invention as claimed and the disclosure of D(4) was that the claim was directed to an intended method of **subcutaneous administration**. The board stated that a different mode of administration for a pharmaceutical could render a medical use claim drafted according to decision G. 5/83 novel. Patentability should be treated as depending only on whether this modification was in fact novel and inventive. Thus, it was possible to acknowledge novelty over D(4) (see T. 143/94, OJ 1996, 430).

g) Interpretation of "substance or composition"

In T. 2003/08 of 31 October 2012 the board allowed a claim directed to a new use of a column for an extracorporeal treatment. The appellant (opponent) argued, relying on decisions T. 227/91 (OJ 1994, 491), T. 775/97 and T. 138/02, in which the boards defined the term "medicament", that claim 1 did not fulfil one prerequisite to qualify as a second medical use claim, namely that a "medicament" was used in the treatment. Indeed the means used in the treatment were a "column", which was not a "medicament", but a "device". In the board's view, it emerged from the whole reasoning of decision G. 5/83 (i) that the Enlarged Board intended to allow the special second medical use-form of protection only for those uses in the medical domain which concerned a "substance" or "composition", (ii) that it was the "substance" or "composition" which achieved the medical effect and (iii) that the terms "substance" or "composition" referred at least to products which were chemical entities or compositions of chemical entities. In the case at issue the medical effect on which the treatment according to claim 1 was based was the removal of immunoglobulin from the plasma of patients suffering from dilated cardiomyopathy. This effect was achieved by the "specific ligand for human immunoglobulin", which was undisputedly a chemical entity. The "column" only served as a carrier for the ligand and was not instrumental in achieving the therapeutic effect. Accordingly, the board held that the means used for the treatment in accordance with claim 1 was to be considered as a "substance" or "composition" within the meaning of decision G. 5/83.

In T. 1758/15 the patent related to a biocompatible, biodegradable, injectable filler material (e.g. collagen or hyaluronic acid) for use in a specific method. Said use comprised the injection of the filler material into a space between a first tissue of the body and a second tissue, the first tissue being subsequently treated by radiation, whereby the filler within the space reduced the exposure of the second tissue to radiation. The filler "human collagen" was known in the art. In the interpretation of the term "substance or composition" the board referred to G. 5/83 (OJ 1985, 64) and T. 2003/08 which interpreted the term "substance or

composition" as being "the active agent or ingredient" of the particular specific medical use. Accordingly, the following must be established: (a) the means by which the therapeutic effect is achieved and (b) whether that which achieves the therapeutic effect is a chemical entity or composition of chemical entities. In the present case, the effect of the use of the filler material was the reduction of radiation-treatment-induced side effects on sensitive organs. This effect was constantly ascribed to the physical displacement of the sensitive tissue, i.e. to the 3D structure achieved within the body. The accumulated mass of the filler material did not, however, qualify as a chemical entity or composition of chemical entities in the sense of G 5/83. Therefore, the filler material was not a substance or composition in the sense of Art. 54(5) EPC and its specific use could not be regarded as a differentiating feature. The undisputedly commercially available collagen was thus novelty-destroying.

In T 773/10 claim 1 was directed to a new use of a dialysis membrane for the treatment of multiple myeloma. It was undisputed that document D1 disclosed all the structural features of the dialysis membrane. Art. 54(5) EPC states that Art. 54(2) EPC does not exclude the patentability of any substance or composition, comprised in the state of the art, for use in a method referred to in Art. 53(c) EPC, provided that its use for any such method is not comprised in the state of the art. The board stated that these provisions introduced a special assessment of novelty for purpose-related features. According to the appellant's submissions, the specific use of the dialysis membrane claimed in claim 1 for the treatment of multiple myeloma, i.e. a method of treatment by therapy of the human body, was not comprised in the state of the art. Therefore, it was crucial to determine whether the special assessment of novelty set out in Art. 54(5) EPC might apply to such a membrane and whether the claimed membrane should be considered a "substance or composition" within the meaning of Art. 54(5) EPC. Referring to the "travaux préparatoires" for the EPC 2000 the board had no doubt that decision G 5/83, had focused on new uses of compounds or "substances", i.e. products of the pharmaceutical industry generally referred to as "medicaments" or "drugs". However, showing that the legislative history did not include discussions on new uses of medical products other than compounds or "substances", i.e. products of the pharmaceutical industry generally referred to as "medicaments" or "drugs", could not establish that the legislator had intended to include any such products within the meaning of "substance or composition". The board came to the conclusion that the scope of the term "substance or composition" in Art. 54(5) EPC did not extend to all products for a specific use in a method referred to in Art. 53(c) EPC. The board referred to T 2003/08 (see above), which allowed a claim directed to a new use of a column for an extracorporeal treatment. However, in that decision it was not the column as such which had been regarded as the "substance or composition" the new use of which could confer novelty according to Art. 54(5) EPC. Rather, the column contained a ligand constituting the "active" ingredient responsible for the "therapeutic effect". In the board's view, the case before it was different. The claimed dialysis membrane did not contain any further substance or composition which might constitute an "active" ingredient within the meaning of decision T 2003/08. It followed that for the claimed dialysis membrane the exceptional novelty assessment as set forth in Art. 54(5) EPC did not apply. The application was refused.

In T.2369/10 the independent claim was formulated as a use-related product claim, in particular for a device for use in a method of treatment of the human or animal body by therapy. The main issue to be resolved was whether a second (or further) medical use could confer novelty on a known device. The board held that, having regard to the wording of Art. 54(4) and (5) EPC, the ordinary meaning of those provisions could not be extended so as to include something which was not explicitly provided for. It consequently considered that there was no basis on which to contemplate that novelty might be conferred on products other than substances and compositions by virtue of the provisions of Art. 54(4) and (5) EPC.

h) Statement of purpose of surgical use for a known instrument

In T.227/91 (OJ 1994, 491) the board held that the purpose of a surgical use alone could not render novel the subject-matter of a claim relating to the use of the components of a known instrument for its manufacture, i.e. assembly. The claim under consideration related to the "use" of intercepting of a laser beam of substrate means and coating means in the manufacture of a laser surgical instrument (the use). The indication of the purpose, i.e. intercepting the laser beam, was a characteristic of the surgical use of the instrument and did not affect the structure or composition of the entity itself. This kind of functional reference could not normally impart novelty to an otherwise known article unless the function implied a necessary modification of the article itself. The surgical use of an instrument was not analogous to a therapeutic use, since the instrument was not consumed in the application and could be used repeatedly for the same or even for other purposes (T.138/02, T.1099/09).

i) Discovery of a previously unknown property of a compound underlying the known effect

In T.254/93 (OJ 1998, 285) an application relating to the use of a retinoid compound in association with the use of corticosteroids in the prevention of skin atrophy was refused by the examining division. The board noted that it was a basic consideration in G.2/88 (OJ 1990, 93) that the recognition or discovery of a previously unknown property of a compound, such property providing a new technical effect, could involve a valuable and inventive contribution to the art. The board stated that it had no difficulty in accepting that the prevention of skin atrophy had to be regarded as a pharmaceutical feature and, following the conclusions of the Enlarged Board of Appeal, that the effect underlying this feature was not made available to the public in written form by any of the cited literature. Nevertheless, the question arose whether, in the case at issue, this effect was a technical effect within the meaning of decisions G.2/88 and G.6/88 (OJ 1990, 114), which was necessary to establish novelty, under Art. 54(1) EPC 1973, of the claimed subject-matter over the prior art. Although it concerned a specific aspect of the known use, the use specified in claim 1 (prevention of skin atrophy) was not actually different from the known use (treatment of dermatoses). The board observed that when a second medical indication was claimed in relation to the use of a constituent in the preparation of a known composition and the final effect was apparent in **using the known composition for the known purpose**, a technical problem could be seen neither in the obtaining of the final effect nor in the preparation of the composition. The only remaining question could be the

explanation of the phenomenon underlying the treatment according to the known process. However, the **mere explanation of an effect** obtained when using a compound in a known composition, even if the explanation related to a pharmaceutical effect which was not known to be due to that compound in the known composition, could not confer novelty on a known process if the skilled person was already aware of the occurrence of the desired effect when applying the known process (see also T 669/01, T 605/09, improvement of activity in a pet is not a new technical effect in terms of G 2/88; T 433/11).

Similarly, in T 486/01 the physiological effects highlighted by the patent proprietor were only regarded as additional items of knowledge about a further mechanism of action underlying the known therapeutic application.

In T 385/07 claim 1 was drafted in the form of a second/further medical use of aplidine for making a medicament for the treatment of a mammal affected by pancreatic cancer. The relevant issue was whether or not this use related to a novel medical use within the meaning of decision G 5/83 (OJ 1985, 64). The board found that, following decision T 158/96, the information in a citation that a medicament was undergoing a clinical phase evaluation for a specific therapeutic application was not prejudicial to the novelty of a claim directed to the same therapeutic application of the same medicament if the content of said citation did not allow any conclusion to be drawn with regard to the actual existence of a therapeutic effect or any pharmacological effect which directly and unambiguously underlay the claimed therapeutic application. It was true that the present application related to in vivo results in mice, not humans. However, it was an accepted principle of the case law that, for the purpose of patent protection of a medical application of a substance, a pharmacological effect or any other effect such as an effect observed on animal models was considered to provide sufficient evidence of a therapeutic application if, for the skilled person, this observed effect directly and unambiguously reflected such a therapeutic application (see e.g. T 241/95, OJ 2001, 103). Applying this principle, the board accepted in the case at issue that, in the absence of any data on human patients, the in vivo experiment was sufficiently predictive of the in vivo anti-tumour activity in humans.

j) Whether there is a therapeutic method

In T 454/08 the board confirmed that if a claim formulated as a Swiss-type claim was not directed to the use of any therapeutic method or was de facto directed to a non-therapeutic use, the feature defining the use was purely illustrative and could not be used to establish novelty over the prior art. In effect, this specific novelty approach applied only to claims directed to the use of a substance or composition intended for use in a method referred to in Art. 52(4) EPC 1973 (now Art. 53(c) EPC). Claim 1 of the main request was based on the model proposed by G 5/83, namely the application of a substance to produce a composition for a particular use. However, nothing in the wording of claim 1 implied use in any of the therapeutic methods within the meaning of Art. 53(c) EPC. The specific novelty approach created by G 5/83 thus did not apply to claim 1 of the main request, the subject-matter of which amounted to a process claim. The step of administering the tablet had to be seen as an illustrative feature of the tablet and not as a limiting feature for a specific mode of administration.

In T. 1278/12 the board had to decide whether the main claim constituted a second medical use claim (Swiss-type claim). The appellant argued that the reference to "an infant delivered via caesarean section" implicitly indicated a therapeutic effect. The board stated that an enteral administration to an infant delivered via caesarean only specified the mode of delivery to the patient, but did not relate to any therapeutic effect obtained thereby. The appellant argued that, according to T. 1020/03, the therapeutic effect did not need to be specified in a claim for it to qualify as a further medical use claim. The board did not share the appellant's view and observed that the board in T. 1020/03 had explicitly stated that the further medical indication had to be specified in the claim with some degree of specificity. Since claim 1 of the main request did not specify any therapeutic effect at all, it represented a non-medical use claim. Therefore the wording "for enteral administration to an infant delivered via caesarean section" limited claim 1 only in so far as the composition had to be suitable for the enteral administration to caesarean section infants. Since this suitability was given in some documents, these were novelty-destroying for the subject-matter of claim 1.

8. Second (or further) non-medical use

8.1. Novelty criteria for use claims and process claims containing a purpose feature

8.1.1 General issues decided before the Enlarged Board of Appeal

In general, the EPC allows both method claims and use claims, but whether an activity is claimed as a method of carrying out the activity (setting out a sequence of steps) or as the use of a thing for a stated purpose (the sequence of steps being implied) is a matter of preference. For the Enlarged Board of Appeal there is no difference of substance (G. 5/83, OJ 1985, 64).

The Enlarged Board dealt in detail with the novelty of second non-medical uses in G. 2/88 (OJ 1990, 93) and G. 6/88 (OJ 1990, 114). The questions referred to it concerned use claims, i.e. claims defining a "use of compound X for a particular purpose", or similar wording, where the only novel feature was the purpose of that use. They were not about medical inventions but were of a general nature and primarily concerned interpretation of Art. 54(1) and (2) EPC 1973. The patentability of a second non-medical use of a product had already been recognised in principle in G. 5/83 (OJ 1985, 64), which concerned the second medical use of a substance.

In the non-medical field use claims are admissible and not subject to special conditions.

In G. 2/88 (OJ 1990, 93) and G. 6/88 (OJ 1990, 114), the Enlarged Board had to decide whether a claim for the use of a compound for a particular non-medical purpose was novel under Art. 54 EPC 1973, having regard to a prior publication which disclosed the use of that compound for a different non-medical purpose, so that the only novel feature in the claims was the purpose for which the compound was used. The specific problem in these cases was that the previously disclosed use of the substance, although specifically stated

to be for another purpose, would **inherently** comprise the use as claimed in the new application (T. 59/87, OJ 1988, 347; T. 208/88 of 20 July 1988).

The Enlarged Board cited T. 231/85 (OJ 1989, 74), a case concerning an application for use as a fungicide of a compound already disclosed in the prior art as a growth regulator. The use according to the claimed invention and the use disclosed in the prior art were both carried out in the same way (i.e. the means of realisation was the same, namely the spraying of useful plants). The board had nevertheless concluded that the claimed invention was novel because the technical teaching in the application differed from that in the citation, and that, even if means of realisation was the same, the use was not yet known.

In G. 2/88 and G. 6/88, therefore, it was pointed out that a claimed invention lacked novelty unless it included **at least one essential technical feature** which distinguished it from the state of the art. A basic initial consideration, when deciding upon the novelty of a claim, was therefore to analyse it in order to determine its technical features. The Enlarged Board took the view that the proper interpretation of a claim whose wording clearly defined a new use of a known compound would normally be such that the attaining of a new technical effect on which the new use was based was a technical feature of the claimed invention. Thus, where the particular technical effect underlying such use was described in the patent, the proper interpretation of that claim would require a **functional feature** to be implicitly contained in the claim as a technical feature – e.g. the compound actually achieved the particular effect.

The Enlarged Board thus concluded that, with respect to a claim to a new use of a known compound, such new use might reflect a newly discovered technical effect described in the patent. The attaining of such a technical effect should then be considered as a **functional technical feature** of the claim (e.g. the achievement in a particular context of that technical effect). Had that technical feature not previously been made available to the public by any of the means set out in Art. 54(2) EPC 1973, then the claimed invention was novel, even though such technical effect might have inherently taken place in the course of carrying out what had previously been made available to the public. The final decisions in cases T. 59/87 (OJ 1991, 561) and T. 208/88 (OJ 1992, 22) both held that the claimed use inventions were novel and inventive.

8.1.2 Non-therapeutic treatment of animals

In decision T. 582/88 the board applied the principles set out in decision G. 2/88 in slightly different circumstances. The invention's subject-matter was a method of non-therapeutic treatment of animals for the purpose of improving their milk production and comprising oral administration of a propionate-increasing amount of glycopeptide antibiotics. In the board's view the technical effect produced by the invention – in this case an improvement in milk production – was new and had to be construed as a new technical feature sufficient to make the invention novel. The claim's subject-matter was a method of non-therapeutic treatment of animals, not – as in decision G. 2/88 – use of a known product to achieve a new effect (see also T. 848/93).

a) Non-therapeutic application

In T 469/94, the set of claims had been worded as a second non-medical use of a product (choline or a choline derivative) to alleviate muscle fatigue. The examining division had considered that the known treatment with choline of muscle diseases and hardness was equivalent to, or even a synonym for, the treatment for reducing muscle fatigue which was claimed in the application in suit. The board concluded that the ability of choline to reduce the perception of fatigue had not been made available to the public. The first use of choline, in the therapeutic field, was known from two prior art documents. The board held that an independent invention could be based on the newly discovered effect, if such an effect led to a new technical application which was clearly distinguishable from the previous known application. The prior art documents did indeed describe the use of choline on groups of patients having manifest diseases: either epilepsy or muscle diseases and injuries. The board observed that fatigue arising from major exercise was not of a pathological nature, and that the performance itself of major exercise appeared to be quite incompatible with the situations envisaged in the prior art documents, specifically that of muscle injuries. The non-therapeutic use of choline according to the invention was therefore independent of, and distinguishable from, the known therapeutic use, because it was **directed to a distinct group of persons**. The subject-matter of the claim at issue was therefore found to be novel.

8.1.3 Applicability of G 2/88 and G 6/88 to process claims

a) General

In several decisions, the boards have taken the view that the criteria set out by the Enlarged Board in G 2/88 and G 6/88 (OJ 1990, 93 und 114) cannot readily be applied to process claims. Particularly in the more recent case law, they have found that those criteria can be applied only to claims directed to the use of a substance for achieving an effect and cannot be extended to claims directed to a process for producing a product characterised by process steps wherein the purpose of carrying out said process steps is indicated in the claim (T 1049/99, T 1343/04, T 1179/07, T 304/08, T 2215/08, T 1039/09, T 1140/09). The case law has constantly interpreted G 2/88 in a restrictive manner, i.e. to mean that only claims relating to the use of a known compound for a particular purpose, based on a technical effect described in the patent, should be interpreted as including that technical effect as a functional technical feature, provided that such technical feature has not previously been made available to the public (T 1822/12).

b) Different treatment of use and process claims

In T 1049/99 the board took the view that the criteria set out in decisions G 2/88 and G 6/88 (OJ 1990, 93 and 114) could not simply be transferred to process claims. The board pointed out that, according to those decisions, a new purpose related to a new technical effect could render novel the claimed use of a product already known, even though the means of realisation making it possible to achieve the new purpose was identical to the known means of realisation, given that a use claim in reality defined the use of a particular physical entity to achieve an effect. The board distinguished this situation from that of a

process claim which defined the use of a particular physical entity to achieve a product and, therefore, fell within the scope of Art. 64(2) EPC 1973. An extension of the criteria set out in the decisions of the Enlarged Board referred to above would result in protection of a product obtained by a process already known on the basis of the new effect discovered in the process itself, even though that process was identical to that already known (see also T 910/98).

In T 1179/07 the board found that the central findings in G 2/88 and G 6/88 concerned a claim to the use of a known compound for a previously unknown purpose. No findings were made in those decisions with respect to process claims for a specific use. Although the "use of a compound" could be regarded as a process including the compound use as a procedural step, a use claim could not normally be treated as equivalent to a process claim because Art. 64(2) EPC was not, as a rule, applicable to use claims. According to the Enlarged Board in G 2/88, Art. 64(2) EPC was generally not directed to patents whose claimed subject-matter was the use of a process to achieve an effect (this normally being the subject of a use claim) but rather to European patents whose claimed technical subject-matter was a process of manufacture of a product. Despite the indicated purpose, the process claimed in this case was clearly aimed at manufacturing a product: a procedural treatment of the source product resulted in an end product differing from the source product. Were the board to extend the findings made in G 2/88 and G 6/88 to the granted process claim, this would confer fresh protection under Art. 64(2) EPC on the product resulting from granted process claim 1 even though that product was already known from D1 and obtained by precisely the same process as that described in D1. It could not, however, be in keeping with the object and purpose of Art. 64(2) EPC to extend its protection to a product obtained by a known process. It was, in particular, this difference in the treatment of process and use claims in the context of Art. 64(2) EPC which, in the board's view, left it no scope to extend the principles laid down by the Enlarged Board in G 2/88 and G 6/88 with regard to the use of a known compound for a previously unknown purpose to process claims (see also T 684/02, T 910/98 and T 1049/99).

In T 304/08 the board noted that G 6/88 and G 2/88 (OJ 1990, 93) contained no finding concerning claims to a method (or process, these two terms being used synonymously in this decision) wherein the purpose of carrying out the method was defined in the claim. However, G 2/88 stated that there were basically two different types of claim, namely a claim to a physical entity (e.g. product, apparatus) and a claim to a physical activity (e.g. method, process, use) and that the technical features of a claim to an activity were the physical steps which defined such activity. Decision G 2/88 further distinguished, in the context of defining the extent of protection conferred under Art. 64(2) EPC, between claims which defined the use of a particular physical entity to achieve an "effect" and the use to produce a "product" and concluded that, providing that the use claim in reality defined the use of a substance to achieve an effect and did not define such a use to produce a product, the use claim was not a process claim within the meaning of Art. 64(2) EPC. Thus, the criteria set out by the Enlarged Board of Appeal in the aforementioned decisions could only be applied to claims directed exclusively to the use of a substance for achieving an effect.

In T. 1092/01 the board held that the rationale of decision G. 2/88 was applicable to a claim directed to a known process by which a previously unknown technical effect (conversion of lutein to its isomeric form zeaxanthin) was achieved. It considered that the relevant question to be answered was whether the skilled person would use the claimed process for a purpose different from that for which the processes in the prior art had been used. In the board's judgment, in view of its starting material and its procedural steps, the claimed process could only serve the same final purpose of production of pigments for food industry. The disclosure of the purpose did not open the way to a new activity and occurred inherently when carrying out the process in the prior art. Hence the board concluded that the statement of such an effect could not confer novelty on the claimed process (see T. 1039/09). Observing that the board in T. 1092/01 had not given any detailed reasons for the above-mentioned finding (in point 17 of the decision) that the rationale of G. 2/88 could also be applied to a process claim, the board in T. 1179/07 likewise held that stating the purpose in the process claim could not establish novelty.

c) Interpretation of process claims

Where a process claim begins with wording such as "method for remelting galvanic layers", the part "for remelting" is not to be understood as meaning that the process is merely suitable for remelting such layers, but rather as a functional feature concerning the remelting of galvanic layers and, hence, defining one of the steps in the claimed process (see T. 848/93 below). Such a case has to be distinguished, however, from those where the claim is directed to a process aimed at a particular purpose and comprises physical steps resulting in the production of a product (i.e. the claim is in fact directed towards the production of a product).

In T. 848/93 the application claimed a process which differed from the prior art only in its use (remelting instead of vapour phase soldering). The board considered the process feature "remelting galvanic layers" to be a functional technical feature which established novelty. If a claim concerned e.g. an apparatus which differed from a known apparatus only as regards the use indicated, then the use was not an apparatus feature. This meant that the two pieces of apparatus were identical in terms of structure. If the known apparatus was suitable for the claimed use, the application lacked novelty. If the claim was directed to an object, a substance or a composition, the same applied. If however the claim was for a process, the situation was not comparable. In such a case, the use feature was a functional process feature comparable in category with the other features (steps) of the process.

d) Use of a known process for a particular purpose

The board in T. 461/07 observed that it was settled case law that there was no basis for regarding the purpose of carrying out a process as having the effect of a functional technical feature distinguishing the process from others carried out using identical features but for a different purpose (T. 210/93 and T. 1343/04).

In T. 210/93 the originally claimed process for the production of a rubber product was held not to be novel by the examining division because the claimed temperature range was

already disclosed in D1. With reference to G. 2/88 and G. 6/88, the applicants thereupon claimed the use of this known process for the purpose of preparing the rubber product having a certain maximum ratio of constituent X. They argued that in the absence of a disclosure of this mole ratio in D1, this constituted a "specific technical purpose of achieving the previously unknown chemical structural arrangement". The board observed that decisions G. 2/88 and G. 6/88 related to claims to the use of a known compound for a particular purpose, in contrast to the appellants' claim, which was directed to the use of a known process for a particular purpose, the purpose being the preparation of a particular product naturally resulting from such process. In the board's view, the **use of a process for the purpose of preparing its product(s)** could be said to be nothing but that very same process, and the scope of protection appeared to be the same for a claim to the process as such and a claim to such use (confirmed in T. 684/02 and T. 2215/08).

In T. 684/02 the board noted that claim 1 was directed to the use of the fluorination reaction process in order to remove the unstable end groups from the starting polymer. The effect of this process manifested itself in its result, i.e. in the product together with all its internal characteristics and the consequences of its particular history of origin (see T. 119/82; OJ 1984, 217) but not in an effect observed in a particular use of the product. Moreover, in the board's view, a claim to the use of a process or to the process itself addressed the producer of a product, irrespective of any conceivable later applications, methods of further processing or uses of the product, whilst a claim to the use of a product clearly addressed the customer/user of that product. In other words, the asserted advantage or purpose could not be taken into account as a functional technical feature in claim 1 because of the jurisprudence of the boards of appeal as well as for technical reasons, because the asserted advantage or purpose was related only to the product (manufactured in some process or other) when used in certain circumstances and marginal conditions.

In T. 1039/09 the physical steps of the claimed method were the same as in the prior art. However it was submitted that the purpose of the method, namely producing bovine milk having a reduced level of saturated fatty acids relative to the level of unsaturated fatty acids, was also a technical feature to be taken into account in the assessment of the novelty of claim 1. The board stated that the claim at issue related to a known method for a particular purpose, namely the production of a product, wherein the product is the necessary result of the known method and indistinguishable from the product obtained in the prior art. The question arose whether the purpose could be considered a functional technical feature of a claim directed to a process for producing a product characterised by process steps wherein the purpose of carrying out said process steps was indicated in the claim. In the board's judgment the skilled person would not in the present case use the process for any purpose other than the production of its inevitable product, namely milk containing only beta-casein having a proline at position 67 and therefore also having a reduced level of saturated fatty acids relative to the level of unsaturated fatty acids. The board concluded that the relevant technical features for the purpose of assessment of the novelty of the method of claim 1 were its physical steps and that document (D3), which disclosed these physical steps, anticipated the subject-matter of claim 1 of the main request.

In T.1822/12 the appellant submitted that the prior art did not disclose the purpose of the method steps, which was defined in claim 1 as "a method for reducing acrylamide formation in thermally processed foods", or the step of "cooking said food to form a cooked food with a reduced concentration of acrylamide". According to the appellant, the above purpose and step were features limiting the scope of claim 1 and distinguishing it from the disclosures in the prior art. With regard to the above purpose, the appellant submitted that the principles established by G 2/88 and G 6/88 concerning limiting functional features of a claim should apply equally to the method claim in question. The board, however, stated that G 2/88 related only to a use claim, namely to a claim for the new use of a known compound. It concluded that claim 1 of the main request relating to the known method of thermally processing foods for the unknown purpose of reducing acrylamide formation could not be construed to include that purpose as a distinguishing functional technical feature.

e) Discovery of new properties/technical effects underlying the known use

In T.958/90 the board mentioned that a known effect could not be novel for the sole reason that the patent provided the information that it was present to a hitherto unknown extent.

In T.279/93 a claim directed to the use of a first compound in a process for preparing a second compound was revoked by the opposition division for lack of novelty. In particular, the claims were directed to the use of the alkanolamines for reducing the formation of isomelamine impurities. According to the appellant, this purpose, even if it might have been inherently attained by following the teaching of a prior art document, should have rendered the subject matter of the claims novel, since, in application of the reasoning in decision G 2/88 (OJ 1990, 93), inherency did not destroy the novelty of the new use, which had to be regarded as a functional technical feature of the claims. In the board's judgment, the use of a compound in a process for preparing another compound in order to reduce the formation of impurities was not necessarily a functional technical feature within the meaning of decision G 2/88, and did not therefore in all circumstances confer novelty on the subject matter of a claim containing it. The facts of the case at issue differed significantly from those underlying decision G 2/88, since the claim did not appear to contain any new technical effect or technical purpose in the sense required by that decision. In the board's view, noticing that an old product had the property of containing fewer isomelamine impurities was a mere discovery. To convert this into a patentable invention, and to show the characteristics of a new technical effect, the use referred to in the claim would have to be some **new use of the product** which exploited the discovery that the isomelamine impurities were low for some new technical purpose.

In T.1855/06, the board held that novelty of a use of a known compound for the known production of a known product could not be deduced from a new property of that product. In such a case, the use of a compound to produce a product had to be interpreted as a process for producing the product with the compound and could be regarded as novel only if the production process as such was novel. Similarly, where its stated purpose was merely to improve an already known property of the product to be produced, the use could not be regarded as a new technical activity within the meaning of G 2/88 and G 6/88, unless the claim required that the improvement be exploited in some form. In line with

T. 279/93, the board held that a finding that a known product had a particular property was a mere discovery and could not establish novelty of a use claim.

In T. 892/94 (OJ 2000, 1) the board noted that according to G. 2/88, novelty within the meaning of Art. 54(1) EPC 1973 could be acknowledged for a claim directed to the use of a known substance for a hitherto unknown, i.e. new, non-medical purpose reflecting a newly discovered technical effect. However, a newly discovered technical effect did not confer novelty on a claim directed to the use of a known substance for a known non-medical purpose if the newly discovered technical effect **already underlay the known use of the known substance**. The disclosure in citation (1) was, in the board's judgment, prejudicial to the novelty of the claim in question. It was immaterial for the purposes of prejudice to novelty that the actual technical effect exhibited by "aromatic esters" in deodorising compositions was not described in the cited document. The ex post facto discovery that the deodorising effect of "aromatic esters" when used as an active ingredient in deodorising products could result from their capability of inhibiting esterase-producing micro-organisms might possibly be regarded as a (potentially surprising) piece of knowledge about the known use or application of such esters but could not confer novelty on a claim, since the latter would require that the newly discovered effect did indeed result in either a new technical application or use of the "aromatic esters", which was not necessarily correlated with the known application or use and could be clearly distinguished therefrom.

In T. 706/95 the board held that the discovery that the **same known means** led to an additional effect when they are used for the **same known purpose** (i.e. known use) of reducing the concentration of nitrogen oxides in the same effluent could not confer novelty on this known use (see also T. 934/04).

In T. 189/95 the board ruled that a new property of a substance, i.e. a new technical effect, did not necessarily signal or give rise to a new use for that substance. For example, the new property might **merely explain the mechanism behind the use already described in the prior art**, as in T. 892/94 (OJ 2000, 1). Here again the board ruled that discovering a new property or activity did not in itself render novel a claim for the use of a known substance for a known non-medical use, if the discovery only showed what formed the basis of the known use of the known substance.

In T. 151/13 the board stated that the purpose of a particular reagent in a known chemical process is not a functional technical feature in the sense of G. 2/88 and does not render said process novel.

On the issue of the discovery of a previously unknown property of a compound underlying a known use, see further T. 1073/96, referring to T. 254/93 (OJ 1998, 285). By contrast, it was found that there was a new use, e.g. in T. 319/98, T. 952/99, T. 966/00, T. 326/02 and T. 1090/02.

f) Use of a substance to achieve a technical effect only attained in special circumstances

In T 977/02 the claim in suit was directed not to a device per se but to use of a specific component (an electric machine carcass) to attain a technical effect (to facilitate the recycling of the electric machine). Applying G 2/88 and G 6/88 (OJ 1990, 93 and 114), the board held that a claim to the use of a component having a specific property (material that can be crushed into fragments) for a specific purpose (to facilitate the recycling of an electric machine) stated in the said claim and based on a technical effect described in the patent (flow of the material that can be crushed into fragments through the turns of the winding during recycling) should be interpreted as comprising a functional technical feature by virtue of that technical effect. According to the board, this was still valid when, as in the case before it, the technical effect was attained only in special circumstances (when the electric machine was recycled). The board also held that the choice of the specific material for manufacture of the carcass covered by the use defined by the claim in suit constituted a novel selection.

8.1.4 Statement of purpose in non-medical use claims in view of Article 52(4) EPC 1973

In T 36/83 (OJ 1986, 295) the board stated that having discovered for the first time the surprising properties of a chemical product already known in the state of the art and having shown those properties in various uses, the applicant had the right to have those uses protected. In the particular case the uses were presented in the description as two methods; a method of medical treatment and a method of non-medical treatment. Under Art. 52(4) EPC 1973 a method of medical treatment was not patentable but a product for use in that method certainly was. Claims 1 to 7 had been worded accordingly. The method of non-medical treatment was one falling within the general field of patentable inventions. There could be no objection to the patentability of either use or method claims in general (see G 5/83, OJ 1985, 64). The applicants had chosen the phrase "**use as a cosmetic product of thenoyl peroxide**". The board considered that this form of claim was **acceptable** in the case in suit. The board noted that when considering the exclusions from patentability under Art. 52(4) EPC 1973 the wording of the claim was important. In reaching this conclusion the board held the use of the word "cosmetic" in the context of that application to be sufficiently precise to exclude therapeutic uses, without the need for a specific disclaimer of such uses.

8.1.5 Novelty criteria for product claims with purpose characteristics

It is long standing office practice that a formulation such as "apparatus for" is to be interpreted as meaning an apparatus which is suitable for the stated use, see for example Guidelines F-IV, 4.13 – November 2018 version; T 1389/10). As explained in the Guidelines, as e.g. in the case of a mould for molten steel, the stated use may imply certain physical limitations (size, material) without which the apparatus could not be used for that purpose. Any prior art apparatus which, in addition to features expressly mentioned in the claim also possesses these implicit physical features and can thus reasonably be used for the stated purpose will then take away novelty of the claimed apparatus. This is irrespective of whether or not the prior art mentions the stated use or purpose or whether the stated use is obvious or not. This is because the claim is directed at the apparatus, not

its use. Nor can stating a use that is new and not-obvious render an apparatus which is already known novel and inventive.

In T. 215/84 the board held that the discovery that the known equipment might be used in a new manner could not render the entity itself novel.

In T. 523/89 a particular prior art document disclosed a container having all the structural features defined in claim 1 of the contested patent. Hence, the only outstanding issue was the fact that D1 nowhere indicated that the container disclosed therein was intended to be used for ice-cream. The board noted that the question of anticipation of a claim to an article for a particular use was dealt with in the Guidelines (Guidelines F-IV, 4.13 – version 2018), from which it was clear that, with the exception of medical uses of known substances, the indication of intended use was only to be seen as **limiting to the extent that the article had to be suitable for that use**. In other words, disclosure of an equivalent article without an indication of the particular use claimed – although the article was nevertheless suitable for it – would cause lack of novelty of a claim to the article for that particular use. The board saw no reason to disagree with this general principle of interpretation laid down in the Guidelines.

In T. 15/91 the board ruled that, according to the case law of the boards of appeal, the discovery that known apparatus could be used in a manner not hitherto described did not substantiate the novelty of that apparatus, if the hitherto unknown use did not require any modification to the technical design of the known apparatus (see T. 523/89).

In decisions T. 303/90 and T. 401/90 the main claims related to a contraceptive composition comprising known pharmaceutical compounds. The board was of the opinion that the composition as claimed could not be considered novel and the added word "contraceptive" did not change the product claim into a use claim. **Only in the case of first medical use** could the addition of a purpose characteristic render a product claim new, if the product as such was known in other technical fields (see also T. 1200/03).

In T. 637/92 the board held that, according to established case law, the statement of purpose of a claimed device (or product) was to be interpreted as meaning that the device was **suitable for the stated purpose** and that a known device that served another purpose but otherwise possessed all the features listed in the patent claim was not prejudicial to the novelty of the subject-matter of the claim if the known device was unsuitable for the purpose referred to in the claim (see also T. 287/86). In the case in question, however, these conditions had not been met since the device known from the citation did not possess one of the features of claim 1.

1. Introduction

An invention shall be considered as involving an **inventive step** if, having regard to the **state of the art**, it is not **obvious** to a **person skilled in the art** (Art. 56, first sentence EPC). The "state of the art" for the purposes of considering inventive step is as defined in Art. 54(2) EPC. It does not include later published European applications referred to in Art. 54(3) EPC. Such earlier applications are part of the state of the art only when considering novelty and not when considering inventive step (see Guidelines G-IV, 5.1 and G-VII, 2 – November 2018 version).

Technical progress is not a requirement for patentability under the EPC. Therefore, technical progress shown in comparison with marketed products as an alleged support for inventive step cannot be a substitute for the demonstration of inventive step with regard to the relevant closest state of the art (see T 181/82, OJ 1984, 401; T 164/83, OJ 1987, 149; T 317/88; T 385/94; T 850/02).

The extent of the monopoly conferred by a patent should correspond to and be justified by the technical contribution to the art. This general principle of law, applied in T 409/91 (OJ 1994, 653) and T 435/91 (OJ 1995, 188) (albeit to determine the scope of protection justified under Art. 83 and Art. 84 EPC 1973), also applies to decisions under Art. 56 EPC 1973, because everything covered by a legally valid claim has to be inventive (see also T 1060/11). Otherwise the claim has to be amended, by deleting anything obvious to ensure that the monopoly is justified (T 939/92, OJ 1996, 309; T 930/94; T 795/93; T 714/97).

2. Problem and solution approach

The "problem and solution approach" is regularly applied by the departments of the EPO in the course of deciding whether or not claimed subject-matter fulfils the requirements of Art. 56 EPC. This consists essentially of

- (a) identifying the "closest prior art",
- (b) assessing the technical results (or effects) achieved by the claimed invention when compared with the "closest state of the art" established,
- (c) defining the technical problem to be solved as the object of the invention to achieve these results, and
- (d) examining whether or not a skilled person, having regard to the state of the art within the meaning of Art. 54(2) EPC, would have suggested the claimed technical features in order to obtain the results achieved by the claimed invention (see e.g. T 939/92, OJ 1996, 309; T 15/93; T 433/95; T 917/96; T 631/00; T 423/01; T 215/04; T 1621/06; T 1183/06; T 824/07; see also Guidelines G-VII, 5 – November 2018 version).

On application of the problem and solution approach to claims comprising technical and non-technical aspects (especially in the case of computer-implemented inventions), see in this chapter I.D.9.1., and for its application to claims directed to chemical inventions, see in this chapter I.D.9.8.1.

The boards frequently cite R. 42(1)(c) EPC as the basis for the problem and solution approach. R. 42(1)(c) EPC requires that the invention be disclosed in such terms that the technical problem (even if not expressly stated as such) and its solution can be understood. Problem and solution are thus component parts of any technical invention. The problem and solution approach was primarily developed to ensure objective assessment of inventive step and avoid ex post facto analysis of the prior art.

A solution claimed as non-obvious is patentable **only if** it actually has the alleged effect. According to T 2001/12, a doubt that the invention as claimed is capable of solving the problem defined in the application may have the following consequences: a) If the question arises because the claim fails to specify those features which are disclosed in the application as providing the solution to the problem, then the description and claims are inconsistent in relation to the definition of the invention, and an objection under Art. 84 EPC 1973 may properly arise that the claims do not contain all the essential features necessary to specify the invention. b) If this is not the case, but, having regard to the prior art, and irrespective of what may be asserted in the description, it does not appear credible that the invention as claimed would actually be capable of solving the problem, then an objection under Art. 56 EPC 1973 may be raised, possibly requiring a reformulation of the problem. See also T 862/11 which also dealt with the distinction between the requirements of sufficiency of disclosure (Art. 83 EPC), clarity of the claims (Art. 84 EPC), and inventive step (Art. 56 EPC).

According to the case law of the boards (see T. 1/80, OJ 1981, 206; T. 20/81, OJ 1982, 217; T. 24/81, OJ 1983, 133; T. 248/85, OJ 1986, 261), the assessment of inventive step has to be based on the objective, not subjective, achievement of the inventor. By starting out from the objectively prevailing state of the art, the technical problem is to be determined on the basis of objective criteria and consideration given to whether or not the disclosed solution is obvious to the skilled person. Although the problem and solution approach is not mandatory, its correct application facilitates the objective assessment of inventive step. The correct use of the problem and solution approach rules out an **ex post facto analysis** which inadmissibly makes use of knowledge of the invention (T. 564/89, T. 645/92, T. 795/93, T. 730/96, T. 631/00). In principle, therefore, the problem and solution approach is to be used; however, if exceptionally some other method is adopted, the reasons for departing from this generally approved approach should be stated.

In T. 967/97 the board stated that the problem and solution approach was essentially based on actual knowledge of technical problems and ways to solve them technically that the skilled person would, at the priority date, be expected to possess objectively, i.e. without being aware of the patent application and the invention that it concerned (see also T. 970/00, T. 172/03).

In T. 2517/11 the board held that the fact that a technical feature of a known method was "hidden" – i.e. implicit in a prior-art document and not identifiable on a mere reading of that document – and could be detected only by way of a mathematical analysis did not mean that it could not be taken into account as a disclosed feature. If an analysis revealed such a "hidden" feature, that showed it was publicly available; whether there had been any objective reason to carry out the analysis was irrelevant (with reference to G. 1/92, OJ 1993, 277). This followed from the objective nature of the problem and solution approach developed in the boards' case law, which entailed consideration of all technical features comprised in the closest prior art, regardless of whether they were directly identifiable or hidden, since even hidden features were publicly available.

The board in T. 1761/12 held that the problem and solution approach involved analysing the steps the skilled person would have taken to solve the predefined objective technical problem, and nothing else. Any further reflection on whether the associated changes to the closest prior art identified in this analysis made sense had the effect, in practice, of adding the related aspects of other problems to the objective technical problem initially defined.

In T. 320/15 the board held that the problem and solution approach did not consist of a forum in which the appellant (opponent) could freely develop various attacks based on diverse prior-art documents in the hope that one of them would succeed.

Instructive summaries of the case law on the problem and solution approach can be found in a number of decisions; see e.g. R. 9/14, T. 519/07, T. 698/10.

According to the board in T. 270/11, the problem and solution approach does not require that the application specify what feature is responsible for producing precisely what advantage or technical effect. All that is required for inventive step is that the claimed

subject-matter is not obvious to the skilled person in the light of the prior art (Art. 56 EPC). It is common practice to take features from dependent claims or the description and insert them into an independent claim with a view to rendering the subject-matter patentable and to cite the effects and advantages associated with those features as a basis for (re-)formulating the technical problem. To determine the objective technical problem, the technical results and effects achieved by the claimed invention as compared with the closest prior art must be assessed.

In T.188/09 the board noted first that whatever approach was applied as an auxiliary means for the evaluation of inventive step of claimed subject-matter, in a given evidential situation it had to provide the same result, be it either in favour of or against inventive step. Therefore, even if the "problem and solution approach" was applied, the decision on inventiveness should be the same as if it had not been used. Citing T.465/92 (OJ 1996, 32), the board observed: "if an invention breaks new ground it may suffice to say that there is no close prior art rather than constructing a problem based on what is tenuously regarded as the closest prior art."

In T.465/92 (OJ 1996, 32) the board did not take the problem and solution approach when assessing inventive step, and said this was merely one possible approach, with advantages and drawbacks. It took the view that all of the seven relevant citations came equally close to the invention. See also T.967/97 in the chapter I.D.3.1. "Determination of closest prior art in general".

In case R.5/13 (as well as R.9/13, R.10/13, R.11/13, R.12/13 and R.13/13 which were all directed against T.1760/11), the petitioners argued that they should have been allowed to discuss all the issues of inventive step of any stage of the problem and solution approach in respect of all possible starting points that they wished to rely on, despite the fact that the board had structured the discussion by first establishing which document or documents constituted the most promising starting point. The Enlarged Board in R.5/13 held that the board had not only followed the sequence for the debate announced in its communication annexed to the summons to oral proceedings, but by doing so it had also systematically applied the standard method of the problem and solution approach. The Enlarged Board stated that the examination whether or not the subject-matter of a patent claim involved an inventive step according to the well-established problem and solution approach was a matter of substantive law. That was equally true for the determination of the closest prior art as the first step of the problem and solution approach, whether one document alone or a plurality of documents was taken as the starting point or most promising springboard aiming at the invention.

3. Closest prior art

3.1. Determination of closest prior art in general

The boards have repeatedly pointed out that the closest prior art for assessing inventive step is normally a prior art document disclosing subject-matter conceived for the same purpose or aiming at the same objective as the claimed invention and having the most relevant technical features in common, i.e. requiring the minimum

of structural modifications (see in this chapter [I.D.3.2.](#)). A further criterion for the selection of the most promising starting point is the similarity of the technical problem (see in this chapter [I.D.3.3.](#)). In a number of decisions, the boards have explained how to ascertain the closest prior art constituting the easiest route for the skilled person to arrive at the claimed solution or the most promising starting point for an obvious development leading to the claimed invention (see in this chapter [I.D.3.4.](#) and [I.D.3.5.](#)).

In [T.1212/01](#), the board held that the determination of the closest prior art is an objective and not a subjective exercise. It is made on the basis of the notional skilled man's objective comparison of the subject-matter, objectives and features of the various items of prior art leading to the identification of one such item as the closest.

The expression "closest prior art" does not mean that it must be sufficiently close to the claimed invention on an absolute basis, but only that it must be relatively closer to the claimed invention than the other prior-art disclosures ([T.698/10](#)). The closest prior art must be assessed from the skilled person's point of view on the day before the filing or priority date valid for the claimed invention ([T.24/81](#), OJ 1983, 133; [T.772/94](#); [T.971/95](#); see also Guidelines G-VII, 5.1 – November 2018 version).

As closest prior art, a "bridgehead" position should be selected, which the skilled person would have realistically taken under the "circumstances" of the claimed invention. Among these "circumstances", aspects such as the designation of the subject matter of the invention, the formulation of the original problem and the intended use and the effects to be obtained should generally be given more weight than the maximum number of identical technical features ([T.870/96](#); see also [T.66/97](#)).

In [T.1742/12](#) the board endorsed [T.967/97](#) and [T.21/08](#), in which it was found that if the skilled person had a choice of several workable routes, i.e. routes starting from different documents, which might lead to the invention, the rationale of the problem and solution approach required that the invention be assessed relative to all these possible routes, before an inventive step could be acknowledged (see also [T.323/03](#), [T.1437/09](#), [T.308/09](#), [T.259/15](#)). Conversely, if the invention was obvious to the skilled person in respect of at least one of these routes, then an inventive step was lacking (see also [T.558/00](#), [T.308/09](#), [T.1437/09](#), [T.2418/12](#), [T.1570/13](#)). In [T.967/97](#) it was further stated that, if an inventive step was to be denied, the choice of starting point needed no specific justification. The board in [T.1742/12](#) also held that a piece of prior art may be so remote from the claimed invention, in terms of intended purpose or otherwise, that it can be argued that the skilled person could not conceivably have modified it so as to arrive at the claimed invention. Such prior art might be referred to as "unsuitable". However, this did not prohibit the consideration of an inventive step assessment starting from a piece of prior art with a different purpose (see also [T.855/15](#), [T.2304/16](#)).

If a piece of prior art is "too remote" from an invention, it should be possible to show that the invention is not obvious to a skilled person having regard to this piece of prior art

(T. 855/15, T. 2057/12, T. 2304/16). A generically different document cannot normally be considered as a realistic starting point for the assessment of inventive step (T. 870/96, T. 1105/92, T. 464/98).

In T. 176/89 the board concluded that the closest prior art comprised two documents in combination with each other. It found that, **exceptionally**, the two documents had to be read in conjunction; they had the same patentee, largely the same inventors, and clearly related to the same set of tests. As a rule, however, when assessing inventive step, two documents should not be combined if, in the circumstances, their teaching is clearly contradictory (see also T. 487/95).

The board in T. 2579/11 ruled that there was no justification for disregarding a priority application and choosing a subsequent application as the closest prior art simply because the description in the subsequent application was by and large more detailed.

Public prior use may be used as the closest state of the art (T. 1464/05).

In T. 172/03 the board held that the term "state of the art" in Art. 54 EPC 1973 should be understood as "state of technology", and that "everything" in Art. 54(2) EPC 1973 is to be understood as concerning the information which is relevant to a field of technology. It could hardly be assumed that the EPC envisaged the notional person skilled in the (technological) art would take notice of everything, in all fields of human culture and regardless of its informational character.

However, the board in T. 2101/12 considered that the interpretation of Art. 54(2) EPC given in T. 172/03 was incorrect. According to the board in T. 2101/12, the legislator would have used a different term if such meaning had indeed been intended. The wording of Art. 54(2) EPC is clear and requires no interpretation. Art. 54(2) EPC itself contains no limitation according to which a non-technical process, such as the signing of a contract at the notary's office, may not be considered state of the art.

3.2. Same purpose or effect

According to established case law, a central consideration in selecting the closest prior art is that it must be directed to the same purpose or effect as the invention, otherwise it cannot lead the skilled person in an obvious way to the claimed invention.

According to T. 606/89 the closest prior art for the purpose of objectively assessing inventive step is generally that which corresponds to a **similar use** requiring the minimum of structural and functional modifications (see also T. 574/88, T. 606/89, T. 686/91, T. 834/91, T. 482/92, T. 59/96, T. 650/01, T. 1747/12). In T. 273/92 the board confirmed the established case law that a document could not qualify as the closest prior art to an invention **merely because of similarity** in the composition of the products; its suitability for the desired use of the invention also had to be described (see also T. 327/92). According to T. 506/95 the closest prior art was the art most suitable for the purpose claimed by the invention, not the art superficially showing structural similarities. Ideally, that purpose should already be mentioned in the prior art document as a goal worth achieving

(T.298/93, T.859/03). The aim was that the assessment should start from a situation as close as possible to that encountered by the inventor. The real-world circumstances had to be taken into account. If it was not clear what the closest prior art was, the problem and solution approach should be repeated taking possible alternative starting points (T.710/97, T.903/04, T.2123/14).

In T.2255/10 (citing T.482/92), the board stated that in establishing the closest prior art, the determination of the purpose of the invention is not to be made on the basis of a subjective selection from among statements of purpose which may be set out in the description of the application, without any reference to the invention as defined in the claims. On the contrary, the question to be asked is, what, in the light of the application as a whole, would be achieved by the invention as claimed. For this reason, statements of purpose must be read in conjunction with the claims. Merely inserting such a statement into the description does not entitle an applicant effectively to "veto" any inventive step objection based on a document which is unrelated to this purpose, if it is not plausible that the invention as claimed would actually achieve the stated purpose.

In T.53/08 the board found that the disclosure in each of the two documents (1) and (10) differed from the patent in suit in respect of just a single feature. In deciding whether document (1) or document (10) had to be regarded as the closest prior art, it considered the patent's objective, which was to develop the highly effective herbicidal ingredient of formula (A1) in such a way that it did not significantly damage crops when used in a concentration with herbicidal effect. The natural starting point for the invention was therefore the document disclosing the active ingredient of formula (A1).

In T.2571/12 the board held that, in the case of claims directed to medical uses, the closest prior art is usually a document disclosing the same therapeutical indication.

3.3. Similarity of the technical problem

A document serving as the starting point for evaluating the inventive merits of an invention should relate to the same or a similar technical problem or, at least, to the same or a closely related technical field as the patent in suit (T.495/91, T.570/91, T.989/93, T.1203/97, T.263/99, T.1634/06).

In T.439/92 the board pointed out that one of the criteria for determining the closest prior art was the problem already stated in the patent. In many cases it was reasonable for there to be a link between this problem and the prior art chosen as being closest.

In T.698/10 the board held that the closest prior art did not have to disclose all the problems solved by the claimed invention. In particular it did not have to disclose the objective technical problem, which was only determined in the second step of the problem and solution approach based on the technical effect(s) provided by those features distinguishing the invention as claimed from the closest prior art.

In T. 325/93 the application related to an epoxy resin dispersion which provided a cured resin with improved impact resistance. The board stated that the problem addressed by the application was neither derivable nor indeed recognisable from the disclosure of D2 which, according to the department of first instance and the appellant, represented the closest prior art. As early as T. 686/91, another board had observed that a document not mentioning a technical problem which is at least related to that derivable from the patent specification does not normally qualify as the closest prior art for inventive step purposes, however many technical features it may have in common with the subject-matter of the patent concerned (see also T. 410/93, T. 708/96, T. 59/96, T. 827/00, T. 979/00 and T. 496/02).

In T. 644/97 the board concluded that a technical problem arising from a "closest prior art" disclosure which was irrelevant to the claimed subject-matter (in the sense that it did not mention a problem that was at least related to that derivable from the patent specification) had a form such that its solution could practically never be obvious, because any attempt by the skilled person to establish a chain of considerations leading in an obvious way to the claimed subject-matter was bound to fail (see also T. 792/97 and T. 599/03). However, according to the board in T. 1408/09, it is not a requirement for obviousness that the starting point in the prior art addresses the same technical problem as the claimed invention.

In T. 835/00 D1 did not mention any of the problem aspects addressed by the claimed invention. As a consequence, a technical problem was created which was unrelated to the actual disclosure of D1 but whose solution was then found to be obvious in the light of the disclosure of D2. The board referred to T. 686/91 and stated that it was a fatal defect that a prior art disclosure from which no relevant technical problem could be formulated without inappropriate hindsight had been chosen as a starting point for the application of the problem and solution approach, because without such hindsight any attempt to establish a logical chain of considerations which might lead to the claimed invention inevitably ran into difficulties at the start, for want of a relevant identifiable goal or object. If the relevant problem was not derivable from the alleged closest prior art, the measures for its solution were a fortiori not derivable. In other words, the invention was not obvious in the light of such art (see also T. 548/03, T. 1898/07).

In T. 25/13, D4 related to tumble dryers and so came under domestic appliances, a field neither the same nor even closely related to that of the invention, namely automotive technology. For that simple reason, it could not be "the closest prior art". The board, however, held that opponents were essentially free to choose the starting point for assessment and that their choice then had implications for the technical knowledge of the relevant skilled person.

3.4. Most promising starting point

3.4.1 General

The boards have consistently held that, where more than one document is cited as the closest prior art, the one which must be deemed the closest is that which provides the skilled person with the most promising springboard to the invention, i.e. the one starting

from which the subject-matter of the invention is rendered most obvious (T 656/90, T 824/05, T 1755/07, T 698/10).

The starting point for the assessment of inventive step should be one which is at least "promising", in the sense that there is some probability of a skilled person arriving at the claimed invention. However, when applying these principles, care must be taken to avoid an ex-post-facto-approach. A skilled person endeavouring to arrive at a simple construction is unlikely to begin by using prior art relating to an exceptional embodiment with a complex mechanism, and then to omit this mechanism from the invention (T 871/94).

In T 1841/11 the board stated that even if prior art relating to the same purpose is available, it is not excluded that a document relating to a similar purpose might be considered to represent a better – or at least an equally plausible – choice of closest prior art, provided that it would be immediately apparent to the skilled person that what is disclosed in the document could be adapted to the purpose of the claimed invention in a straightforward manner, using no more than common general knowledge.

3.4.2 Most promising springboard

T 254/86 (OJ 1989, 115) described the objectively closest prior art as the "most promising springboard" towards the invention which was available to the skilled person (see also T 282/90, T 70/95, T 644/97, T 1939/12, T 369/12).

In T 824/05 the board was faced with the situation of two alternative starting points equally suitable for the assessment of inventive step, whereby one starting point, i.e. D11, led to the conclusion that the claimed subject-matter was obvious and the other starting point, i.e. D1, gave the opposite result. The board held that in this situation D1 did not qualify as the closest state of the art because it did not represent the most promising springboard towards the invention.

3.5. Further criteria for determining the closest prior art

3.5.1 Defective disclosure

In T 211/01 the board stated that, apart from the fact that a skilled person would normally not consider an obviously defective disclosure at all, it would in particular be artificial to select a defective disclosure as a starting point for evaluating inventive step, when there exists other prior art which is not doubted with regard to its disclosure, but is also directed to the same purpose or effect as the patent in suit. Thus, a document which is so obviously defective as to be readily recognised as such by those skilled in the art when trying to reproduce its disclosure cannot be taken as the most promising and appropriate starting point for the assessment of inventive step.

3.5.2 Confidential disclosure in the application

In T 211/06 the examining division used as a starting point for the assessment of inventive step background art indicated in the application, which according to the applicant comprised confidential information. The board stated that prior art meant publicly available art at the priority date, and not some internal prior art known only within the company employing the inventors. Disclosure in the application as filed which turns out not to be prior art under Art. 54(2) EPC 1973 cannot be used as a starting point for assessing inventive step, nor can subjective "laboratory practice" put forward by the examining division without any objective evidence that this was knowledge available to the public be used as a starting point for assessing inventive step.

3.5.3 Speculative character

In T 1764/09 the board noted that D1 was no more than a speculative review of what might be potentially feasible in the future. No concrete realisation of a fully adapted lens for a contact or intraocular lens was described in D1. Therefore, for this reason alone, D1, the document selected by the examining division, could not objectively be considered as a realistic starting point or the most promising springboard towards the claimed invention.

In T 184/10 the respondent argued that document (14) did not qualify as closest prior art because of its speculative character. The board stated that the author of document (14) gave an outlook into future trends, which were of course not yet verified by experimental evidence. In view of the fact that this outlook was based on the data available at the time, the skilled person would not dismiss it as pure speculation. Instead, he would regard it as a serious attempt to interpret the existing state of the art. As a consequence, the content of document (14) qualified as closest prior art.

In T 725/11 the invention was directed to a pharmaceutical co-formulation in the form of a tablet comprising two active ingredients for HIV therapy. The board did not acknowledge an inventive step over an announcement by the patentee of a clinical trial of that combination therapy in an industry journal article. The patentee argued that this journal article was not the closest prior art because it was silent on efficacy and did not provide any technical details. The board disagreed and stated that the journal article amounted to a concrete plan to develop a commercially viable product with a usable level of efficacy. Furthermore, the article was a public statement of intent made by the patentee's CEO and its executive vice president of research and development which would not be dismissed by the skilled person as mere speculation.

3.5.4 Old prior art documents

In principle, any document that is state of the art under Art. 54(2) EPC may be a candidate for the closest prior art. The jurisprudence acknowledges, however, some cases where a document may not be a realistic starting point because it either relates to outdated technology, and/or is associated with such well known disadvantages that the skilled person would not even consider trying to improve on it. However, a document's age as

such is not a ground for excluding it as closest prior art and as a starting point for the assessment of inventive step (T.1408/04).

In T.334/92 the board held that a document that had been disregarded for more than 20 years by those skilled in the art, had never been used during that period as a basis for further development, was moreover completely silent about the extent of the indicated activity and, finally, did not even mention, let alone discuss, the relevant state of the art, did not represent the closest state of the art and could not therefore be used to define a realistic technical problem. However, in T.964/92, filed as a divisional application to T.334/92, the board held that the same document could be considered as a realistic starting point for the determination of the relevant technical problem.

In T.1000/92 the board did not agree to the selection of document (1) as the closest state of the art because the disadvantages of the process described in document (1), which had been published about 30 years before the priority date of the application, were so evident and well-known that a skilled person would not have tried to improve and develop such an old process (see also T.616/93). In T.823/03 the board stated that the skilled person had good reasons not to select D2 content as a basis for further development since too many uncertainties existed.

In T.479/00 the board did not regard a 65-year-old document as a realistic starting point for the evaluation of inventive step. It was unrealistic to assume that, without hindsight, somebody of average skill in the art of colouring ceramic articles in 1994 would have had the intention to improve a technique which had not received any attention during the previous 65 years. Furthermore, the teaching of this document, published in 1929, had never been put into practice on a commercial scale.

However, in T.69/94 the board pointed out that Art. 54(2) EPC 1973 defined the state of the art as comprising everything made available to the public, clearly without any time restriction. Thus a document which related to an antiquated technology no longer used in industry comprising a teaching disapproved by those skilled in the art at the filing date of the patent in suit could not simply be disregarded as the closest prior art only because of its publication date about 20 years before the filing date of the application documents. In T.113/00 the board said that resurrecting very old teaching (in the case in hand 31 years old) with an obvious modification did not make known subject-matter inventive. In T.1397/07 the board added that there was no legal basis in the EPC to preclude a particular state of the art from being taken into account when assessing inventive step, merely because of being published some years earlier than another one. In T.153/97 it was also stated that there was no plausible reason why the skilled person should have disregarded a document only because the publication date lay 30 years in the past.

3.5.5 Improvement of a production process for a known product

Where the invention concerns improving a process to manufacture a known chemical compound, then the closest prior art is confined to documents describing that compound and its manufacture. Comparison with these alone shows whether an improvement has been achieved which can thus be taken into account in formulating the problem the

invention sought to solve (T.641/89, T.961/96, T.713/97, T.948/01, T.833/02, T.339/03). In the case of inventions concerning a special process for use with a particular chemical substance having necessarily specific characteristics, determining the closest prior art must involve, above all, considering only those documents which describe a generically corresponding process for using precisely this particular chemical substance with its specific characteristics (T.1285/01, T.354/03, T.1652/08). This accurately and objectively reflects the actual situation in which the skilled person found himself on the priority date of the contested patent (T.793/97).

The above considerations regarding the closest prior art also apply to production processes for subject-matter other than a chemical compound. In T.325/97 the patent related to a method for manufacturing a device for controlled delivery of nicotine from an adhesive reservoir. In T.373/94 the board also applied the principles and conclusions laid down in T.641/89 where the invention related to the improvement of a manufacturing process for prefilled plastic syringes.

3.6. Consequences of choosing a certain starting point

In T.570/91 the board emphasised that although a person skilled in the art was completely free in choosing a starting point, he would of course be bound afterwards by that choice. If, for instance, the skilled person preferred and decided to start from a specific compressor piston, he could further develop that piston but at the end of that development the normal result would still be a compressor piston and not an internal combustion engine piston. In T.439/92 it was explained that a conscious choice of starting point, made in the knowledge of the respective benefits and drawbacks of the various types concerned, not only determined the subject-matter serving as a starting point but also defined the framework for further development, i.e. a further development within this particular type. A change of type during the further development of the consciously chosen type, to another type, which was previously known but had not been chosen, could then only be seen as the result of an ex-post-facto analysis (see also T.1040/93, T.35/95, T.739/95, T.255/03). It is unlikely, and normally not obvious, for the invention type originally chosen to be changed during development (T.817/94, T.749/11, T.535/10).

Following T.439/92, the board stated in T.1228/08 that, although D1 disclosed the use of hierarchical coding, which was a major aspect of the invention, this document did not represent a realistic starting point for an attack on inventive step. A conscious choice of a starting point not only determines the subject-matter serving as a starting point but also defines the framework for further development. Thus, using D1 as a starting point would mean that any further development would be carried out in the context of multicasting: it was unrealistic to suggest that, starting from this disclosure, the skilled person would go outside this framework – indeed take a technical step back – to develop a non-multicasting system.

In T.487/95 the board chose a military protective helmet as the closest prior art, pointing out, however, that this did not mean that documents describing protective helmets of a different kind (such as workers' safety helmets) could not form part of the knowledge of a person skilled in the art. The information contained in the patent which related to a known

military protective helmet (D9) represented the **primary** source of information, i.e. the most promising point of departure, from which the skilled person would attempt to arrive at the claimed subject-matter. The other documents could, however, represent important **secondary** sources of information (in this case: workers' safety helmets) from which the skilled practitioner could obtain indications and suggestions with regard to the problem addressed (see also T.149/00).

The invention in T.25/13 related to a device for fastening an actuator and a housing, for use in a motor vehicle. D4, the only document cited by the opponent, which bore the burden of proof for lack of inventive step, described a fastening device for a tumble dryer. Opponents were essentially free to choose the starting point for assessment, but their choice then had implications for the technical knowledge of the relevant skilled person.

4. Technical problem

4.1. Determination of the technical problem

R. 42(1)(c) EPC (former R. 27(1)(c) EPC 1973) stipulates that an application's description must "disclose the invention, as claimed, in such terms that the technical problem (even if not expressly stated as such) and its solution can be understood, and state any advantageous effect of the invention with reference to the background art". As long ago as T.26/81 (OJ 1982, 211), R. 27(1)(c) EPC 1973 was recognised as clearly binding. The boards' case law, and correct application of the problem and solution approach (see T.1/80, OJ 1981, 206; T.24/81, OJ 1983, 133), show that objective criteria must be used to determine the technical problem, i.e. the problem which can be seen to have been actually solved in the light of the closest prior art which may be different from the prior art which was at the disposal of the inventor (T.576/95). These objective criteria may be specifically defined by assessing the technical progress made in the subject-matter of the application against the closest prior art (T.20/81, OJ 1982, 217; T.910/90). A comparison of the problem indicated in the application with that indicated in a prior document must avoid an unduly abstract approach far removed from the practical thinking of the person skilled in the art (T.5/81, OJ 1982, 249).

In identifying the problem it is not permissible to draw on knowledge acquired only after the date of filing or priority. According to T.268/89 (OJ 1994, 50) the non-effectiveness of a prior art apparatus or method recognised or alleged only after the priority or filing date could not be drawn on in **formulating the problem**, particularly where that problem was adduced in support of inventive step in a "problem invention" (see T.2/83, OJ 1984, 265). Inventive step had to be assessed on the basis of the skilled person's knowledge before the priority or filing date (see also T.365/89).

For the purpose of the problem and solution approach, the problem must be a technical one that a skilled person in the particular technical field might be asked to solve at the priority date. The technical problem may be formulated using an aim which is to be achieved in a **non-technical field**, and which is thus not part of the technical contribution provided by the invention to the prior art (T.641/00, OJ 2003, 352; T.154/04, OJ 2008, 46); see also in this chapter I.D.9.1. "Treatment of technical and non-technical features".

In T.1639/07 the board held that the objective technical problem must be derived from physical, chemical etc. effects directly and causally related to the technical features of the claimed invention. An effect could not be validly used in the formulation of the technical problem if the effect required additional information not at the disposal of the skilled person even after taking into account the content of the application in question. See also T.584/10.

In T.377/14 the board, referring to T.344/89, held that the problem did not have to be explicitly disclosed in the application as filed; it sufficed if it was foreshadowed therein.

In T.1841/11 the board held that a problem which is not mentioned in the application in relation to the claimed feature, and which would not arise over the whole ambit of the claim, or even for those embodiments described in detail in the application, cannot be considered to be a suitable choice.

In T.632/10 the board considered that an objective technical problem solved by the invention was to implement a digital signature system compliant with the requirements of Section 17 of the German Signature Law (SigV). The appellant (applicant) argued that the SigV might not be relevant for a European patent application, for which states other than Germany could be designated. The board was unconvinced by this argument. Even if an invention happened to be obvious only for skilled persons of German nationality or residence, it would still lack an inventive step within the meaning of Art. 56 EPC 1973. The fact that the SigV was valid only within Germany thus had no bearing on its status as prior art or its relevance for the assessment of inventive step outside Germany.

In T.1422/12 claim 1 related to crystalline forms of tigecycline. The board referred to the established case law that the technical problem has to be determined on the basis of objectively established facts, since for the determination of the objective technical problem, only the effect actually achieved vis-à-vis the closest prior art should be taken into account (T.13/84, OJ 1986, 253 and T.39/93, OJ 1997, 134). In this connection, any effects may be taken into account, so long as they concern the same field of use and do not change the character of the invention (T.440/91). The formulation of the technical problem to be solved fell well within the framework of the invention as disclosed in the application in suit. That the more specific problem of improved stability with respect to epimerisation was not mentioned in the application as originally filed was irrelevant (T.39/93), since improvement of stability by avoidance of epimerisation, and, as a consequence, improved biological activity was clearly recognisable by the skilled person as a desirable effect for a tetracycline antibiotic.

In T.519/07, the board held that, where **comparative tests** were chosen to establish inventive step on the basis of an effect produced over the claimed area, the comparison with the closest prior art had to show convincingly that the effect was attributable to the feature distinguishing the invention. The aim of such comparison was to demonstrate that the technical effect had its **exclusive origin** in the feature characterising the invention in the claims (see also T.1682/15). That had not been shown in the case in point. It could not be concluded from the comparisons that the technical problem defined by the respondent (patent proprietor) had actually been solved by the claimed processes. The technical problem therefore had to be reformulated (see also T.479/06, a case concerning a

cosmetic or dermatological emulsion, in which the board observed that the claimed emulsions had been tested using a different test protocol from that applied when testing one of the emulsions disclosed in the closest prior art).

In T 2579/11 the board considered the probative value of comparative tests carried out by the patent proprietor to show that the claimed invention actually solved the problem of improving biodegradability. The proprietor had not divulged the details of the test protocol applied, citing commercial reasons. The board ultimately found that the test results were neither verifiable nor plausible and therefore insufficient to establish that the problem had been solved successfully.

In T 943/13 the board came to the conclusion that the causal relationship between the substance or composition on the one hand and the therapeutic effect achieved on the other hand was decisive for the assessment of inventive step of **further-medical-use claims**. Indeed the board considered that the objective technical problem was the provision of the claimed therapeutic effect by a different/alternative means. The board acknowledged that the objective technical problem might indeed be the provision of an alternative composition if claim 1 was a "normal" product claim directed to a substance or composition.

In T 87/08 the board stated that Art. 56 EPC requires that the assessment of inventive step is made "**having regard to the state of the art**". Accordingly, a decision is not sufficiently reasoned in the sense of R. 68(2) EPC 1973 (R. 111(2) EPC 2000) if the chain of reasoning to justify the finding of lack of inventive step merely states that a purported effect has not been achieved, i.e. this technical problem had not been solved, without reformulating the problem in a less ambitious way and without assessing obviousness of the claimed solution to that reformulated problem in the light of the cited prior art (T 1079/08, T 306/09, T 2375/10).

4.2. Alleged advantages

According to the case law of the boards of appeal, alleged advantages to which the patent proprietor/applicant merely refers, without offering sufficient evidence to support the comparison with the closest prior art, cannot be taken into consideration in determining the problem underlying the invention and therefore in assessing inventive step (see T 20/81, OJ 1982, 217; T 181/82, OJ 1984, 401; T 124/84; T 152/93; T 912/94; T 284/96; T 325/97; T 1051/97). In T 1027/08, the board added that there was no reason to deviate from this case law as it was based on the understandable rule that a patent can only properly be granted for a solution claimed as non-obvious if it actually has the alleged effect (see also in this chapter I.D.4.6.).

In view of the absence of any data confirming the alleged improvement, such an effect could not be taken into account in the formulation of the technical problem (T 2044/09).

Some beneficial effects or advantageous properties, if appropriately demonstrated by means of truly comparable results, can in certain circumstances properly form a basis for the definition of the problem that the claimed invention sets out to solve and can, in

principle, be regarded as an indication of inventive step. The only comparative tests suitable for this are, however, those which are concerned with the structurally closest state of the art to the invention, because it is only here that the factor of unexpectedness is to be sought (T 181/82, OJ 1984, 401; T 998/04; T 955/96; T 234/04; T 378/03; T 1761/07; see also in this chapter I.D.10.9.).

In T 355/97 the patent related to an improved hydrogenation process for preparing 4-aminophenol. The technical problem as indicated in the patent in suit consisted of improving the performance index of the preparation process without loss of selectivity. The patent proprietor, however, did not demonstrate properly that the purported advantages, i.e. improvement of the performance index without loss of selectivity, of the claimed invention had successfully been achieved. The board referred to the above mentioned jurisprudence and held that, since the alleged advantages lacked the required adequate support, the technical problem needed reformulation. Therefore, the objective problem could only be seen as merely providing a further method for preparing 4-aminophenol (see also T 1213/03). If the proprietor of the patent alleges the fact that the claimed invention improves a technical effect, then the burden of proof for that fact rests upon him (see also T 1213/03, T 1097/09, T 2418/10).

4.3. Formulation of the technical problem

It must be examined whether the problem defined by reference to the closest prior art has indeed been solved the claimed invention. If not, the problem must be reformulated.

When defining the objective technical problem an effect cannot be retained if it is not credible that the promised result is attainable throughout the entire range covered by a claim (T 741/91; T 626/90; T 939/92, OJ 1996,309; T 583/93, OJ 1996, 496).

If the inventive step of a claimed invention is based on a given technical effect, the latter should, in principle, be achievable over the whole area claimed (T 939/92, OJ 1996, 309; T 694/92, OJ 1997, 408; T 583/93, OJ 1996, 496).

4.3.1 No pointer to the solution

According to the established case law, the technical problem addressed by an invention has to be formulated in such a way that it does not contain pointers to the solution or partially anticipate the solution, since including part of a solution offered by an invention in the statement of the problem necessarily results in an ex post facto view being taken of inventive step when the state of the art was assessed in terms of that problem (see e.g. T 229/85, OJ 1987, 237; T 99/85, OJ 1987, 413; T 289/91, OJ 1994, 649; T 422/93, OJ 1997, 24; T 986/96; T 799/02; T 2049/11; T 2461/11).

In T 1019/99 the board stated that the correct procedure for formulating the problem is to choose a problem based on the technical effect of exactly those features distinguishing the claim from the prior art that is as specific as possible without containing elements or pointers to the solution (see also T 1557/07, T 1192/09).

In T. 910/90 the board stated that, when assessing the objective problem, the closest prior art and any technical advance achieved by the characterising features of the invention had to be taken into account. In so doing, it was not important whether this problem had already been mentioned in the closest prior art; what mattered was what the skilled person objectively recognised as the problem when comparing the closest prior art with the invention (see also T. 214/01).

4.3.2 Problem formulated in the patent application as starting point

An objective definition of the problem to be solved by the invention should normally start from the problem described in the contested patent. Only if examination shows that the problem disclosed was not solved or if inappropriate prior art was used to define the problem, is it necessary to investigate which other problem objectively exists (T. 1060/11: "established case law"). The definition of **artificial and technically unrealistic problems** is to be avoided (see T. 495/91, T. 741/91, T. 334/92, T. 813/93, T. 68/95, T. 644/97, T. 747/97, T. 946/00). This legal principle is also applicable to ex parte proceedings (T. 881/92, T. 882/92, T. 884/92). In T. 419/93 it was added that, when determining the problem, the statements relating thereto in the application should be examined for **correctness** with regard to the prior art and for their **de facto relevance** to the claimed features of the solution. Only if the problem described in the application did not meet prior art requirements and/or was not solved in accordance with the features of the invention, should it be adapted to the prior art and/or actual technical success. In this connection, T. 800/91 emphasised that in any event the formulated problem should be one which the skilled person knowing only the prior art would wish to solve. It should not be tendentiously formulated in a way that unfairly directed development towards the claimed solution. In T. 400/98, the technical problem set out in the patent had to be reformulated because it had **not been credibly solved**.

In T. 1263/11 the board observed that there was no disclosure of the terms "microscopic surface properties" and "macroscopic surface properties" in the patent in suit. It was not shown that those terms had well-defined, unambiguous definitions in the art. Consequently, they could not be used to formulate the problem to be solved.

In T. 2341/13 the invention related to the hardware implementation of an interleaver. The examining division had considered it problematic that the application suggested that the invention could be used in a communication system based on a standard that was neither publicly available at the priority date nor fully disclosed in the application. The board observed that knowledge of any communication standard was not necessary to carry out the claimed invention and that it was perfectly valid to pose the problem of obtaining interleavers for frame sizes that were not a multiple of $2^{**}(m)$. If the claimed solution to this problem was not rendered obvious by the prior art, then an inventive step was present. Whether the application sufficiently disclosed the advantages of such frame sizes was irrelevant, unless it was argued that the mere idea of using such frame sizes was itself inventive (in which case it could not be included in the problem formulation).

4.3.3 Formulation of partial problems – lack of unity

In T 314/99 the three different embodiments which were covered by claim 1 did not belong to the same single general inventive concept (Art. 82 EPC 1973). According to G 1/91 (OJ 1992, 253) lack of unity is not an issue in opposition (or opposition appeal) proceedings. In the case in point the board stated that the consequence of this conceptual lack of unity is that different aspects of the problem apply to the three embodiments and that where conceptual non-unity arises between different embodiments covered by a claim, this may necessitate the formulation of corresponding partial problems, the respective solutions of which must be assessed separately for inventive step. With respect to the requirements of Art. 56 EPC 1973 the inventiveness of the subject-matter of a claim must be denied as a whole in the event that only one of its embodiments is obvious.

4.4. Reformulation of the technical problem

4.4.1 General

The technical problem arising may have to be reformulated, in particular in less ambitious terms, if it appears in view of experimental evidence that the combination of features in the claim does not solve this problem over the whole area defined in the claim (T 20/81, OJ 1982, 217; T 39/93, OJ 1997, 134). See also T 2001/12.

It belongs to the well-established jurisprudence of the boards of appeal that where a specific problem is identified in the description, the applicant or patentee may be allowed to put forward a modified version of the problem particularly if the issue of inventiveness has to be considered on an objective basis against a new prior art which comes closer to the invention than that considered in the original patent application or granted patent specification (T 184/82, OJ 1984, 261; T 386/89). Applying the problem and solution approach, when the original technical problem defined in the application as filed has to be modified to take account of the closest prior art, the objective, more restrictive, problem is determined by the underlying remaining features of the claim (T 39/93, OJ 1997, 134). However, reformulation of the problem is only allowable, if the new problem can be deduced from the application as filed (T 13/84, OJ 1986, 253), i.e. within the limit of the original description (T 162/86, OJ 1988, 452). As a matter of principle, any effect provided by the invention may be used as a basis for reformulating the technical problem, as long as that effect is derivable from the application as filed (T 386/89, see Guidelines G-VII, 5.2 – November 2018 version). A reformulation of the problem also may be appropriate if an alleged effect of a described feature could be deduced by the skilled person from the application in the light of the prior art or if new effects submitted subsequently during the proceedings were implied by or related to the technical problem initially suggested. In relation to new effects it was not permissible to change the nature of the invention (T 344/89, T 2233/08).

In T 184/82 (OJ 1984, 261) the board said that "regarding the effect of the invention" reformulation of the problem could be allowed "provided the skilled man could recognise the same as implied or related to the problem initially suggested". The problem may thus be restated to meet a less ambitious objective (see also T 106/91, T 339/96, T 767/02). It

was also ruled in T 13/84 (OJ 1986, 253) that a reformulation of the problem was not precluded by Art. 123(2) EPC 1973 if the problem could be deduced by the skilled person from the application as filed when considered in the light of the closest prior art (T 469/90, T 530/90, T 547/90, T 375/93, T 687/94, T 845/02). In T 818/93 the board added that it sufficed if the reformulated problem could be deduced later by comparing the application with the closest art. Since features from the drawings might be incorporated into the claims, and also into the description in support of the claims (T 169/83, OJ 1985, 193), those features' effects and advantages might also be used as a basis for reformulating the problem, provided this problem could clearly be deduced from the above comparison. T 162/86 (OJ 1988, 452) added that it should still be possible in appeal proceedings to define the original problem more precisely, within the limits of the original description.

According to T 39/93 (OJ 1997, 134), the technical problem as originally presented in the application or patent in suit, which was to be regarded as the "subjective" technical problem, might require reformulation on the basis of objectively more relevant elements originally not taken into account by the applicant or patentee. This reformulation defined the "objective" technical problem. The latter represented the problem ultimately remaining, i.e. the technical effect achieved by the subject-matter (features) as defined in the claim.

Following on from this case law, the board in T 1397/08 confirmed that, in accordance with the problem and solution approach for assessing inventive step in chemistry, the technical problem could be reformulated, and in certain circumstances actually had to be, since the only factor of importance in determining the problem objectively was the result actually achieved in relation to the closest state of the art. There was nothing to prevent the problem as first formulated from being modified, even at the appeal stage, as long as the spirit of the original disclosure of the invention was respected. See also T 2371/13, T 659/15.

In T 716/07 with regard to the reformulation of the problem the board considered whether the examples in the closest prior art document and the patent in suit were comparable to the extent that the alleged effect was convincingly shown to have its origin in the distinguishing feature of the invention (T 197/86, OJ 1989, 371; T 1835/07). Then the board determined whether it was probable that this effect had been achieved over the whole range of the claims of the patent in suit (see T 1188/00), and finally whether the effect was related to the problem to be solved as disclosed in the application as filed. In this case the comparison between the examples in the prior art and those in the patent showed an unexpected effect.

In T 143/13 the board observed that, according to the problem and solution approach, it is the problem described in the patent application that is normally used as the starting point for assessing inventive step. In the decision under appeal, the step of assessing whether the problem defined in the application had been solved had been omitted. Nevertheless, the problem had been reformulated in terms that had not been invoked by the appellant (applicant). The justification provided for the reformulation of the problem was that the originally defined problem was artificial. However, the board could not see why. The reformulation of the problem in the decision under appeal was not considered to be appropriate.

In T. 564/89 the appellant submitted that any amendment of the technical problem had to be in line with Art. 123(2) EPC 1973. The board stated that this article was not concerned with the issue of whether or not an objectively reformulated technical problem could be used in the course of the so-called problem and solution approach. Art. 123(2) EPC 1973 would only come into play if an amended technical problem were incorporated into the description itself (T. 276/06).

In T. 732/89 the respondent submitted that the "hot/wet" performance of the claimed composites, although admittedly better than that of the control composition, corresponded to a completely new effect which could not be incorporated into the technical problem without contravening Art. 123(2) EPC 1973. The board did not agree with this line of argumentation and referred to T. 184/82 (OJ 1984, 261) where a redefinition of the problem regarding the effect of an invention was allowed provided that the skilled person could recognise the same as implied or related to the problem initially suggested. In the case in point the board took the demonstrated effect into account in the formulation of the technical problem and stated that in determining which effect was crucial and which was merely accidental (the so-called "bonus effect"), a realistic approach had to be taken, considering the relative technical and practical importance of those effects in the circumstances of a given case (see also T. 227/89).

4.4.2 Subsequently invoked technical effect

As a rule, additional advantages not mentioned in the application as originally filed but relating to a mentioned field of use can also be considered for the purpose of assessing inventive step, provided such advantages do not alter the character of the invention (T. 440/91, T. 1062/93, T. 67/98, T. 1983/07, T. 1422/12, T. 321/16). Conversely, an alleged technical effect of a feature is not to be taken into consideration when formulating the problem to be solved if the effect cannot be unambiguously deduced by the skilled person from the original application in the light of the closest prior art or if it is not at least hinted at in that application (T. 440/91 citing T. 386/89 and T. 344/89; see also T. 67/98, T. 532/00, T. 321/16, T. 867/13). The character of the invention is not altered if the technical problem specified in the application as filed is supplemented by such advantages, since the skilled person could consider them on account of their close technical relationship to the original problem (T. 440/91, T. 1062/93, T. 321/16).

In T. 235/04 the comparative test report did not allow any conclusion as to whether the technical benefits of the claimed composition vis à vis the closest prior art were achieved within the whole scope of claim 1. The board did not accept the formulation of the technical problem since the purported improvement had not been demonstrated to arise within the whole area that was claimed. When defining the technical problem, an effect cannot be retained if the promised result is not attainable throughout the entire range covered by the claimed subject matter. Therefore, the technical problem needed to be redefined in a less ambitious way (T. 626/90, T. 1057/04, T. 824/07).

In T. 259/05 too the board held the claimed improvement to be unproven; it had not been substantiated by tests or plausibly shown in any other way. The ambitious problem formulated could therefore not be considered successfully solved. So the invention as

defined in claim 1 was not a successful solution to that technical problem. As a result, the claimed improvement in the method's efficiency could not be taken into account for assessing the objective problem which the patent in suit sought to solve, or the inventiveness involved. The technical problem therefore had to be reformulated less ambitiously.

In T 1188/00 the board found that a reformulation relating to an effect first alleged in appeal proceedings (a more ambitious problem) could not be used to substantiate inventive step unless it was plausibly demonstrated that the alleged effect could be achieved across the whole scope of the claim. The burden of proof for this lay with the patent proprietor (see also T 134/00).

In T 357/02 the technical problem had to be reformulated in a less ambitious manner. In the board's view it followed from the minimalist character of the technical problem objectively arising from the closest prior art, which can only be formulated as a modification of that state of the art, regardless of a success or failure of the measures applied, that almost any modification of the latter process might be regarded as a feasible alternative by the person skilled in the relevant art, and therefore obvious, since each corresponding solution would be equally useful (or useless).

Another aspect was described in T 155/85 (OJ 1988, 87). According to this decision, it was not acceptable to rely on an effect which had previously been described as undesirable and of no value by the applicant, to present it suddenly as possibly representing an advantage from another point of view, and thereby to imply that the technical problem and the considerations of inventive step should take this reversal into account. A redefinition of the technical problem should not contradict earlier statements in the application about the general purpose and character of the invention (see also T 115/89). The board in case T 2245/10 recalled that the definition of a technical problem which was in contradiction to the original teaching was not allowable.

4.5. Alternative solution to a known problem

Art. 56 EPC does not require that the problem to be solved should be novel in itself. The fact that the underlying problem of the patent have already been solved by the prior art does not necessarily require redefinition of the problem for the assessment of inventive step, if the subject-matter of the patent represents an alternative solution to this problem. (T 92/92, with reference to T 495/91; see also T 780/94, T 1074/93, T 323/03, T 824/05).

According to T 588/93, for an inventive step to be present, it was not necessary to show improvement – substantial or gradual – over the prior art. Thus an earlier solution to a given technical problem did not preclude later attempts to solve the same problem in another, non-obvious way (T 1791/08).

4.6. Solving a technical problem – post-published documents

According to the established jurisprudence of the boards of appeal the assessment of inventive step is to be made at the effective date of the patent on the basis of the

information in the patent together with the common general knowledge then available to the skilled person (T. 609/02, T. 1329/04, T. 1545/08). Moreover, there can only be an invention if the application makes it at least plausible that its teaching indeed solves the problem it purports to solve. The boards have regularly considered in the context of the evaluation of inventive step whether or not "the problem is solved" (T. 939/92, OJ 1996, 309) and have in cases where they were not satisfied that this was so, i.e. that what was claimed was de facto a solution to the problem, denied an inventive step (T. 210/02, T. 1329/04) or required a reformulation of the problem (T. 939/92, T. 87/08). According to decision T. 1329/04, the verification of whether or not the claimed solution actually solves the problem, i.e. whether the claimed subject-matter actually provides the desired effect, must be based on the data in the application. Post-published evidence to support that the claimed subject-matter solves the problem to be solved is taken into account if it is already credible from the disclosure in the patent that the problem is indeed solved. In other words, supplementary post-published evidence may not serve as the sole basis to establish that the problem is solved (T. 1329/04, T. 415/11, T. 1791/11, T. 488/16). Common general knowledge at the priority date may be used to interpret the teaching in an application or a patent. Post-published evidence can only be used to back up the teaching derivable from the application (T. 716/08, T. 578/06).

In T. 716/08 the board stated that as to the quality of the evidence, "absolute proof" of the achievement of an effect is not required for the effect to be "plausible".

In T. 578/06 the board stated that the EPC requires no experimental proof for patentability and considered that the disclosure of experimental data or results in the application as filed and/or post-published evidence is not always required to establish that the claimed subject-matter solves the objective technical problem. This is in particular true in the absence of any formulated substantiated doubt. The board re-emphasised in this context however that this case law considers the establishment of plausibility only relevant when examining inventive step if the case in hand allows the substantiation of doubts about the suitability of the claimed invention to solve the technical problem addressed and when it is thus far from straightforward that the claimed invention solves the formulated problem. This is all the more clear from decisions where an inventive step was in fact denied because the **formulated problem** was **not** considered to have been solved. By way of example the board referred to T. 893/02 and T. 1329/04.

In T. 433/05 the board referred to decisions T. 1329/04 and T. 1336/04 when deciding whether the technical problem had indeed been solved by the subject matter of claim 1 at the relevant date (see also T. 1306/04, T. 710/05, T. 1396/06).

In T. 1329/04 it was stated that the definition of an invention as being a contribution to the art, i.e. as solving a technical problem and not merely putting one forward, required that it was at least made plausible by the disclosure in the application that its teaching indeed solved the problem it purported to solve. Therefore, even if supplementary post-published evidence might, where appropriate, also be taken into consideration, it could not serve as the sole basis for establishing that the application did indeed solve the problem it purported to solve. In the case before it, the board decided that the post-published evidence could not be regarded as supportive of evidence which would have been given in the application

as filed since there was none. Since the post-published evidence was considered to be the first disclosure going beyond speculation, it was not taken into consideration.

The same Board 3.3.08, confronted with a different technical situation, namely one where the quality of evidence provided in the patent in suit was such that the claimed invention was considered to be a bona fide solution to the problem to be solved, accepted the solution of the problem by also taking into consideration the disclosure in a post-published document (T. 1336/04).

Considering decisions T. 1329/04 and T. 1336/04, the board was convinced in T. 433/05 that the circumstances of the case were appropriate to take into account a supplementary post-published document when establishing whether the application indeed solved the problem it purported to solve. In the light of the disclosure in the patent in suit, which was supported by a post published document, the board was satisfied that the problem was solved by the subject-matter of the claims.

In T. 778/08 the post-published documents were taken into account because they simply provided a confirmation that the general concept of the method of the invention was sound. In reaching this conclusion, the board did not deviate from T. 1329/04. In the case in hand, the experimental data provided in the application as filed rendered the alleged effect and its solution plausible, the post-published documents could not be regarded as the first disclosure going beyond speculation, but rather additionally confirmed that the general concept of the claimed invention worked.

In T. 2371/13, however, the board held that the fact that an effect had to be regarded as implausible because it was not backed up in the application was not a good enough reason to disregard comparative tests filed later with a view to proving it. To do so for that reason would run counter to the problem and solution approach: it required that a technical problem be defined in light of the closest prior art, which was not necessarily that cited in the application. It was common, the board observed, to try to demonstrate inventive step on the basis of a technical effect not explicitly mentioned in the application as filed. The objection that the invention had yet to be achieved when the application was filed was anyway more a matter for consideration under Art. 83 EPC.

5. "Could-would approach"

To determine whether the claimed invention, starting from the closest prior art and the objective technical problem, would have been obvious to the skilled person, the boards apply the **"could-would approach"** (see also Guidelines G-VII, 5.3 – November 2018 version). This means asking not whether the skilled person **could** have carried out the invention, but whether he **would have done** so in the expectation of solving the underlying technical problem or in the expectation of some improvement or advantage (T. 2/83, OJ 1984, 265; T. 90/84; T. 7/86, OJ 1988, 381; T. 200/94; T. 885/97). When considering whether or not claimed subject-matter constitutes an obvious solution to an objective technical problem, the question to be answered is whether or not the skilled person, in the expectation of solving the problem, would have modified the teaching in the closest prior art document in the light of other teachings in the prior art so as to arrive at the claimed

invention (T.1014/07, T.867/13). So the point is not whether the skilled person could have arrived at the invention by modifying the prior art, but rather whether, in expectation of the advantages actually achieved (i.e. in the light of the technical problem addressed), he would have done so because of promptings in the prior art (T.219/87, T.455/94, T.414/98).

In T.1014/07 the board stated that since this question involves determining whether or not the skilled person would – and not could – have made a particular modification, it is necessary for answering the question to identify conclusive reasons on the basis of tangible evidence that would have prompted the skilled person to act in one way or the other. The board in T.1045/12 found that its decision, being based on prior-art documents D4 and D3, was based on "tangible evidence" (referring to T.1014/07).

It has been held that once an invention existed, it could often be shown that the skilled person could have made it by combining different elements in the prior art, but such arguments had to be disregarded as the product of ex post facto analysis (T.564/89).

According to T.939/92 (OJ 1996, 309), the answer to the question what a skilled person would have done depended in large measure on the technical result he had set out to achieve. In other words, the notional "person skilled in the art" was assumed to act not out of idle curiosity but rather with a specific technical purpose in mind.

In T.867/13 the board pointed out that what the skilled person, starting from the closest prior art and faced with the objective technical problem, would or would not do depends not solely on the disclosure of the closest prior art document, but also on the state of the art in the relevant technical field.

In T.1126/09 the board pointed out that, in accordance with the "could-would" approach, the assessment of inventive step must involve establishing, in each individual case, to what extent the skilled person had good reason, in the light of the closest state of the art or the objective problem derivable from it, to adduce further prior art and apply its teaching to the process/apparatus of the closest prior art – or, in other words, whether any factor is discernible which points towards a combination of the teachings of the citations addressed.

Technical feasibility and the absence of obstacles were only necessary requirements for reproducibility but were not sufficient to render obvious **what was actually achievable** for the skilled person (T.61/90). The fact that the inherent properties of a technical means were known to the skilled person, so that he had the intellectual possibility to apply this means in a conventional device, merely established the **possibility** of using such technical means in such a manner, i.e. that the skilled person **could** have used it. However, if it was to be established that such intellectual possibility was also a technical measure which it was obvious for the skilled person to use, it was necessary to show that there was a recognisable pointer in the state of the art to combine the known means and conventional device for achieving the intended technical aim, i.e. that the skilled person **would** have made such a combination. The existence of such a technical reason was dependent on the known properties not only of the means but also of those of the device (T.203/93, T.280/95). That it was theoretically possible for the skilled person to arrive at the invention simply means that he could have used the requisite technical means. If, however, it is to

be established that he would actually have used them, it must be possible to ascertain a pointer in the prior art which would have prompted him to do so (T.1317/08).

6. Ex post facto analysis

Many decisions of the boards of appeal warn against an ex post facto approach when assessing inventive step (see also the Guidelines G-VII, 8 – November 2018 version). This applies especially to inventions which at first sight seem obvious, to combination inventions and where the proposed solution is supposedly "simple". Correct application of the problem and solution approach avoids this inadmissible ex post facto analysis which draws on knowledge of the invention (T.24/81, OJ 1983, 133; T.564/89; T.645/92; T.795/93).

When assessing inventive step, an interpretation of the prior art documents as influenced by the problem solved by the invention, where the problem was neither mentioned or even suggested in those documents, must be avoided, such an approach being merely the result of an a posteriori analysis (T.5/81, OJ 1982, 249; T.63/97; T.170/97; T.414/98).

In T.970/00 the board stated that any ex post facto analysis, and in particular any conclusion going beyond what the skilled person would have objectively inferred from the prior art, without the benefit of hindsight knowledge of the invention, is of necessity at variance with a proper application of the problem and solution approach. Any attempt to interpret the disclosure of the closest prior art so as to distort or misrepresent, based on hindsight knowledge of the invention, the proper technical teaching of the disclosure in such a way that it artificially meets specific features recited in the claim under consideration must fail, especially as this would risk unfairly and tendentiously concealing the technical contribution of the invention and prejudice the subsequent objective determination of the technical problem solved by the claimed invention (see also T.266/07, T.1486/10).

In T.2201/10, the board found that the examining division had taken an ex-post-facto approach to analysing the facts. Even assuming that the proposed solution could be derived from common general knowledge, it went against the very essence of the teaching in the closest prior art and, therefore, would not realistically have been chosen. The problem and solution approach required that documents not relating to the technical field of the invention be disregarded, and it also precluded any analysis according to which the skilled person would have modified the closest prior art in a manner contrary to its very purpose. In other words, a finding that a claimed invention deviated from what was, in light of the aim pursued, the essence of a prior-art disclosure was enough by itself to conclude that it was inventive over that prior art (see also T.2057/12).

In T.855/15 the board held that for the assessment of obviousness no argument was required as to whether the skilled person would select a document. A consideration as to whether the skilled person would select a particular document in order to arrive at the invention as claimed would amount to hindsight reasoning, because the skilled person would have to be assumed to know the invention. The board in T.2057/12 agreed with the board in T.855/15 insofar as the closest prior art belonged to the same or a neighbouring technical field of the skilled person or to his common general knowledge. Argumentation

or evidence should be provided as to why the skilled person in a specific technical field would have indeed envisaged selecting a document in a remote field of technology as closest prior art or whether he would indeed have considered adapting a prior-art disclosure originating from his technical field to implement it in a remote technical field.

7. Expectation of success, especially in the field of genetic engineering and biotechnology

7.1. Reasonable expectation of success

In accordance with the case law of the boards of appeal, a course of action can be considered obvious within the meaning of Art. 56 EPC if the skilled person would have carried it out in expectation of some improvement or advantage (T 2/83, OJ 1984, 265). In other words, obviousness is not only at hand when the results are clearly predictable but also when there is a reasonable expectation of success (T 149/93). It is not necessary to establish that the success of an envisaged solution of a technical problem was predictable with certainty. In order to render a solution obvious it is sufficient to establish that the skilled person would have followed the teaching of the prior art with a reasonable expectation of success (T 249/88, T 1053/93, T 318/02, T 1877/08, T 2168/11, T 867/13).

In some decisions, especially in the field of biotechnology, the boards have asked whether in the cases in point it was obvious for the skilled person to try a suggested approach, route or method with a **reasonable expectation of success** (T 60/89, OJ 1992, 268). For more about biotechnological inventions and the definition of the skilled person, see also point I.D.8.1.3 below.

In T 2168/11 the board referred to the case law, according to which the expectation of success depended on the complexity of the technical problem to be solved. While for very ambitious problems requiring the consideration of all the features relied on by the respondent (patent proprietor) but not contained in claim 1, important difficulties might be expected a priori, less ambitious problems might normally be associated with higher expectation of success (see T 192/06, T 782/07).

In line with T 918/01, the board in T 1577/11 concluded that, given the superior efficacy of anastrozole, as compared with tamoxifen, in treating advanced breast cancer, there was a reasonable expectation it would also improve the treatment of early breast cancer, as compared with that achieved with tamoxifen.

In T 296/93 the board held that, in relation to inventive step, the fact that other persons or teams were working contemporaneously on the same project might suggest that it was "obvious to try" or that it was an interesting area to explore, but it did not necessarily imply that there was a "reasonable expectation of success". A reasonable expectation of success should not be confused with the understandable "hope to succeed"; it implied the ability of the skilled person to predict rationally, on the basis of the knowledge existing before a research project was started, the successful conclusion of the said project within acceptable time limits. The more unexplored a technical field of research was, the more difficult it was to make predictions about its successful conclusion and, consequently, the

lower the expectation of success (T.694/92, OJ 1997, 408). According to T.207/94 (OJ 1999, 273), the "hope to succeed" was merely the expression of a wish, whereas a "reasonable expectation of success" presupposed scientific appraisal of available facts.

In T.187/93 it was stated that even if it was obvious for the skilled person to try an experiment, it was not necessarily true that this person would have any reasonable expectation of success when embarking on it.

In T.223/92 the board said that in 1981, given the state of the art at that time, the skilled person would have opted for DNA-recombination technology only if relying, e.g., on his own good luck and inventiveness to overcome the known (and as yet unknown) problems involved, which would have caused the average skilled person to expect to fail.

In T.923/92 (OJ 1996, 564) the board had to decide whether the skilled person would have attempted, with reasonable expectation of success, to produce cDNA coding for human t-PA, or whether in this instance he would have known from his technical knowledge, before even embarking on the research, that he would be able to complete his project within an acceptable time. The board bore in mind that, as stated in T.816/90, even when it is possible to theoretically conceive a straightforward approach to solve a specific technical problem, the skilled person might be confronted with unexpected difficulties when trying to put the conceived strategy into practice. The board stated that, although hoping to succeed, the skilled person embarking on this project would have known that its successful conclusion depended not only on technical skill in putting into practice the sequence of precise steps of the theoretical experimental protocol, but to a large extent also on the ability to take the right decisions along the way whenever a difficult experimental situation so required. Under these circumstances, it could not be said that the skilled person had a reasonable expectation of success.

In T.386/94 (OJ 1996, 658), again citing T.816/90, the board ruled that, in gene technology, inventive step could not be acknowledged if, at the priority date, a skilled person could expect to perform the cloning and expression of a gene in a fairly straightforward manner, and the cloning, although requiring much work, did not pose such problems as to prove that the expectation of success was ill-founded.

Where the expression of a cloned DNA in a chosen foreign host constituted the subject-matter of the claimed invention, the question whether a reasonable expectation of success existed or not could be evaluated only by taking into account real difficulties relating to that step. Thus, in order to be considered, any allegation that features jeopardised a reasonable expectation of success had to be based on technical facts (T.207/94, OJ 1999, 273).

In T.737/96 the board was of the opinion that it was not appropriate to attempt to evaluate the expectation of success of a random technique such as mutagenesis where results depended on chance events. This was because the skilled person knew that, unless a specific selection method could be developed, which was not the case in the patent in suit, perseverance and chance played a key role in achieving success, as no form of control could be exerted over the mutation events. Under these circumstances, as in a lottery

game, the expectation of success always ranged irrationally from nil to high, so it could not be evaluated in a rational manner based on technical facts (see also T.694/92, OJ 1997, 408).

7.2. Try and see situation

When neither the implementation nor the testing of an approach suggested by the prior art involves any particular technical difficulties, the consideration that the skilled person would have at least adopted a "try and see" attitude is a reason for denying inventive step (see e.g. T.333/97, T.377/95 of 24 April 2001, T.1045/98, T.1396/06, T.2168/11). In such situations the concept of "reasonable expectation of success" does not apply (T.91/98, T.293/07, T.259/15). The skilled person would prefer to verify whether the potential solution he had conceived worked, rather than abandon the project because success was not certain ("try and see" approach).

A "try and see" situation was considered to have occurred if the skilled person, in view of the teaching in the prior art, had already clearly envisaged a group of compounds or a compound and then determined by routine tests whether such compound/s had the desired effect (T.889/02, T.542/03, T.1241/03, T.1599/06, T.1364/08). See also in this chapter J.D.9.19.6 "Enhanced effect".

In T.1396/06 the board held that, in spite of the understandable uncertainties which always characterise biological experiments, the skilled person would have had no reason to adopt a sceptical attitude in the case in hand. He would have had either some expectations of success or, at worst, no particular expectations of any sort, but only a "try and see" attitude, which does not equate with an absence of a reasonable expectation of success (see also T.759/03).

In T.293/07 the board stated that the testing of humans could not be considered to represent known routine tests and accordingly the skilled person was not in a "try and see" situation. In T.847/07 the board considered it questionable whether the skilled person would adopt a "try and see" attitude at all in cases where extensive in vivo animal and ultimately human testing would be necessary in order to determine whether or not a compound has a certain property. See also T.1545/08.

In T.259/15 the board held that the case law did not support the conclusion that the skilled person would systematically avoid a "try-and-see" approach whenever testing on human patients was involved, regardless of the circumstances of the case. In the circumstances of the case in hand, the board considered that the skilled person would test the device in question (a buprenorphine transdermal patch) on human subjects despite the uncertainties as to the maximum duration of application.

In the light of the closest prior art the board saw the technical problem to be solved in T.886/91 in the exact identification and characterisation of DNA sequences of HVB genome subtype adyw. The board pointed out that the situation in T.886/91 could not be compared with the one in T.223/92 and T.500/91, where production of a partially known protein in a recombinant-DNA system was achieved and considered inventive on the basis

of the fact that, in the specific circumstances of those cases, there was no realistic expectation of success. In the case in point the closest prior art had already disclosed the cloning and expression of the HBV genome subtype adyw. The identification and characterisation of the claimed specific sequences of the same genome involved for the skilled person nothing more than the performance of experimental work by routine means in connection with the normal practice of filling gaps in knowledge by the application of existing knowledge.

Decisions [T. 455/91](#) (OJ 1995, 684), [T. 412/93](#), [T. 915/93](#), [T. 63/94](#), [T. 856/94](#), [T. 91/98](#), [T. 111/00](#) and [T. 948/01](#) also consider this topic.

8. Skilled person

8.1. Definition of the skilled person

8.1.1 Definition

According to the case law of the boards of appeal, **the person skilled in the art** should be presumed to be an experienced practitioner who has average knowledge and abilities and is aware of what was common general knowledge in the relevant art concerned at a particular time (average skilled person). He should also be presumed to have had access to everything in the **state of the art**, in particular the documents cited in the search report, and to have had at his disposal the normal means and capacity for routine work and experimentation (Guidelines G-VII, 3 – November 2018 version). The skilled person will be an expert in a **technical field** ([T. 641/00](#), OJ 2003, 352). [T. 39/93](#) (OJ 1997, 134) explained that, whilst generally accepted definitions of the notional "person skilled in the art" did not always use identical language to define the qualities of such a person, they had one thing in common, namely that none of them suggested he was possessed of any inventive capability. It was the presence of such capability in the inventor which set him apart from the notional skilled person.

With regard to the definition of the skilled person, the board in [T. 26/98](#) (confirmed in [T. 1523/11](#)) summarised the following principles which are generally applied by the boards of appeal: if the problem prompts the skilled person to seek its solution in another technical field, the specialist in that field is the person qualified to solve the problem. The assessment of whether the solution involves an inventive step must therefore be based on that specialist's knowledge and ability (see crucial decision [T. 32/81](#), OJ 1982, 225; [T. 141/87](#); [T. 604/89](#) of 15 November 1990; [T. 321/92](#)). The skilled person can be expected to look for suggestions in neighbouring fields if the same or similar problems arise in such fields. The skilled person can be expected to look for suggestions in a general technical field if he is aware of such fields. In advanced technical fields the competent "skilled person" could be taken to be a team of experts from the relevant technical branches. Solutions to general technical problems in non-specific (general) fields are considered to form part of the general technical knowledge.

In [T. 1464/05](#) the board considered the features made available to the public by the public prior use as the closest state of the art. The board stated that, according to established

doctrine, the notional person skilled in the art referred to in Art. 56 EPC 1973 was assumed to be aware of the totality of the prior art pertinent to the relevant area of technology and in particular of everything made available to the public within the meaning of Art. 54(2) EPC 1973. The different means by which the state of the art was made available to the public ranked equally with each other. The notional skilled person was supposed to be aware of all the features of the prior use in suit that had been made available to the public. Thus, although it would be unrealistic to assume that all skilled members of the interested public would have been aware of the features made available to the public by the prior use, the notion of the skilled person under Art. 56 EPC 1973 ensured that any obvious development or application of the features of the public prior use by any particular skilled member of the interested public who had gained information on the features made available to the public by the prior use was treated under Art. 56 EPC 1973 as such, i.e. as obvious with regard to the state of the art, irrespective of whether or not other members of the interested public had actually become aware of the features of the prior use.

In T. 1030/06 the application related to a system and method for securely buffering content. The board considered that the skilled person was a person of ordinary skill in the art which meant not only having access to the state of the art and common general knowledge in the field, but also the capability to perform routine work and experimentation. Thus, the skilled person could be expected to seek out solutions and make choices to try to solve design problems that crop up.

According to the board in T. 1761/12, the position that the problem and solution approach developed through the boards' case law did not allow for considering whether or not it was necessary to retain features not differing from the closest prior art was too formalistic. Over and above the lack of imagination widely attributed to the skilled person, this position also seemed to deny them the capacity to draw conclusions from information obtained direct from the prior art.

According to T. 422/93 (OJ 1997, 25), when examining for inventive step using the "problem and solution approach", the starting point for defining the appropriate skilled person was the technical problem to be solved on the basis of what the prior art disclosed, irrespective of any other definition of the skilled person suggested in the contested patent. Since the technical problem addressed by an invention had to be so formulated as not to anticipate the solution, the skilled person to be considered could not be the appropriate expert in the technical field to which the proposed solution belonged if this technical field was different to the one considered when formulating the technical problem. Nor did the appropriate skilled person's basic knowledge include that of a specialist in the different technical field to which the proposed solution belonged, if the closest prior art gave no indication that the solution was to be sought in this other technical field.

In T. 25/13 the board stated that opponents were essentially free to choose the starting point for assessment (here D4), but their choice then had implications for the technical knowledge of the relevant skilled person. The board concluded that there were two options: either to take the skilled person in the field of the invention (motor vehicle) – who would never have consulted D4 (tumble dryers) because it was from a totally different field

– or to take D4 as the starting point, in which case the skilled person's field would be domestic appliances and the solution would not be obvious to him.

8.1.2 Competent skilled person – group of people as "skilled person"

Sometimes the "skilled person" may be a group of people, such as a research or production team. For the purposes of Art. 56 EPC 1973, the person skilled in the art was normally not assumed to be aware of patent or technical literature in a remote technical field. In appropriate circumstances, however, the knowledge of a team consisting of persons having different areas of expertise could be taken into account (T 141/87, T 99/89, T 26/98). This would be the case in particular if an expert in one particular field was appropriate for solving one part of the problem, while for another part one would need to look to another expert in a different area (T 986/96).

In T 15/15 the board held that where a new technology was about to spread into a traditional field, it was common practice to group people from both technical fields into a development team. The board was thus of the opinion that the skilled person in the case in hand consisted of a team of an orthodontist and an expert in CAD/CAM technology. This conclusion was drawn from the situation in the field before the filing/priority date, without considering any specific invention.

In T 164/92 (OJ 1995, 305, Corr. 387) it was observed that sometimes the average skilled person in electronics, particularly if he did not have an adequate knowledge of programming languages himself, might be expected to consult a computer programmer if a publication contained sufficient indications that further details of the facts described therein were to be found in a program listing attached as an annex thereto.

In T 147/02, the board observed that the skilled person in the field of drainage systems for tunnels, flood barriers, dams and hydro-electric installations, was typically an engineer or architect in the civil engineering sector who drew up plans and supervised the building work, frequently working in a team with other specialists (T 460/87, T 99/89).

Further comments on the concept of the "team of experts" are to be found in the following decisions: T 57/86, T 222/86 (in advanced laser technology, the "skilled person" as a production team of three experts in physics, electronics and chemistry respectively), T 141/87, T 295/88, T 424/90 (consideration that in real life the semiconductor expert would consult a plasma specialist), T 825/93, T 2/94, T 402/95 and T 986/96 (team consisting of a first expert in the field of mail processing and a second expert acquainted with information in the field of weighing) and T 2192/10 (team comprising a machine designer and an actuator technician).

8.1.3 Definition of the person skilled in the art in the field of biotechnology

The person skilled in the art in the field of biotechnology is well defined by the case law of the boards of appeal. His attitude is considered to be conservative. He would never go against an established prejudice, nor try to enter unpredictable areas nor take incalculable risks. The notional skilled person would perform a transfer of technology from a

neighbouring field to his specific field of interest, if this transfer involved routine experimental work comprising only routine trials (T 455/91, OJ 1995, 684; T 500/91; T 387/94; T 441/93; T 1102/00).

In T 60/89 (OJ 1992, 268) the board took the view that the skilled person in genetic engineering in 1978 could not be defined as a Nobel prize winner, even if a number of scientists working in this field at that time actually were awarded that prize. Rather he should be assumed to be a scientist (or team of scientists) working as a teacher or researcher in the laboratories which made the transition from molecular genetics to genetic engineering at that time.

This case law was confirmed in T 500/91 – "BIOGEN II". The board ruled that the average skilled person – who might also be a team of specialists in the relevant field – operated at a practical level, and the technical development which might normally be expected of him did not include solving technical problems through scientific research.

In T 223/92 the board had to consider the knowledge and capabilities of the notional skilled person in the field of genetic engineering as at October 1981, more than one year later than was the case in T 500/91. By this time, a considerably greater number of genes had been made the subject of cloning and expressing methods, and skills and experience in this technical field were developing rapidly. The knowledge of the notional person skilled in the art had to be considered as that of a team of appropriate specialists who knew all the difficulties still to be expected when considering the cloning of a new gene. However, the skilled person had to be assumed to lack the inventive imagination to solve problems for which routine methods of solution did not already exist.

From the notional skilled person nothing more can be expected than the carrying out of experimental work by routine means within the framework of the normal practice of filling gaps in knowledge by the application of existing knowledge (T 886/91, T 223/92, T 530/95, T 791/96).

In T 207/94 (OJ 1999, 273) the board stated that it had to be assumed that the average skilled person would not engage in creative thinking. Yet he or she could be expected to react in a way common to all skilled persons at any time, namely that an assumption or hypothesis about a possible obstacle to the successful realisation of a project must always be based on facts. Thus, in the board's view, an absence of evidence that a given feature might be an obstacle to carrying out an invention would not be taken as an indication that this invention could not be achieved, nor that it could.

In T 412/93 the patent related to the production of erythropoietin. The parties agreed that in this particular case the skilled person should be treated as a team of three, composed of one PhD researcher with several years' experience in the aspect of gene technology or biochemistry under consideration, assisted by two laboratory technicians fully acquainted with the known techniques relevant to that aspect. The composition of the team might vary depending on the knowledge and skills required by the particular aspect dealt with.

In T.455/91 (OJ 1995, 684) the board set out considerations on the skilled person's likely attitude to possible changes, modifications or adjustments to known products (e.g. a plasmid) or procedures (e.g. an experimental protocol). Its aim was to answer, objectively and avoiding any ex post facto analysis, the question whether it would be obvious to the skilled person to make given changes in a structure or procedure. The skilled person in this field was well aware that even a small structural change in a product (e.g. a vector, protein, or DNA sequence) or procedure (e.g. a purification process) could produce dramatic functional changes. He would therefore adopt a conservative attitude. For example, he would neither go against an established prejudice, nor venture into "sacrosanct" or unpredictable areas, nor take incalculable risks. However, within the normal design procedures, he would readily seek appropriate, manifest changes, modifications or adjustments involving little trouble or work and no or only calculable risks, especially to obtain a handier or more convenient product or simplify a procedure. See also T.867/13.

If, on the other hand, he would expect to have to perform scientific research rather than routine work in order to transfer a technology previously set up in one field of research (method of transforming *Saccharomyces cerevisiae* whole cells) to a neighbouring field (method of transforming *Kluyveromyces* whole cells), then inventive step could be acknowledged (T.441/93).

In T.493/01 the invention related to a protective antigen potentially useful in a vaccine against whooping cough. In T.455/91 (OJ 1995, 684) the skilled person in the field of biotechnology had already been defined as being cautious and conservative. The board said this did not mean he would refrain from considering information because it did not concern the mainstream of research in his field of specialisation or because it applied only to some parts of the world. His skill and knowledge were not geographically limited; in fact he would have a global point of view. Thus if, as in the case in point, a pathogen constituted a known threat in some restricted parts of the world, the skilled person would not refrain from taking prior knowledge about that pathogen into consideration or from using it as a basis for his activities.

8.1.4 Identification of the skilled person in the case of computer-implemented inventions

In T.641/00 (OJ 2003, 352) the board stated that the identification of the skilled person needs careful consideration. He will be an expert in a **technical** field. If the technical problem concerns a computer implementation of a business, actuarial or accountancy system, he will be someone skilled in data processing, and not merely a businessman, actuary or accountant (T.172/03).

In T.531/03 the board stated that, in the assessment of inventive step, features relating to a non-invention within the meaning of Art. 52(2) EPC 1973 ("non-technical features") could not support the presence of inventive step. The patentee submitted that the invention at issue required a combination of a technical and a non-technical inventive step, and that the skilled persons would therefore consist of a team of a "non-technical person" plus a technical person. The board rejected this approach and stated that an attempt to take into account the contribution of non-technical and technical aspects on an equal footing in the

assessment of inventive step would be inconsistent with the EPC, since the presence of inventive step would, in such an approach, be attributed to features which were defined in the EPC as not being an invention.

The board in T. 407/11 held that the relevant skilled person in the context of providing computer-system users with operating assistance via a user interface (e.g. error messages or warnings) was an expert in software ergonomics concerned with the user-friendliness of human-machine interfaces rather than an expert in software programming or in computer technology in the strict sense.

8.2. Neighbouring field

Two landmark decisions, T. 176/84 (OJ 1986, 50) and T. 195/84 (OJ 1986, 121) addressed in detail the problem of the relevant technical field, i.e. the question of the extent to which neighbouring areas beyond the specific field of the application might be taken into consideration when assessing inventive step. According to T. 176/84, when examining for inventive step, a skilled person would, as well as considering the state of the art in the specific technical field of the application, look for suggestions in neighbouring fields or a broader general technical field if the same or similar problems arose, and if he could be expected to be aware of such general fields. T. 195/84 added that the state of the art also had to include prior art in a non-specific (general) field dealing with the solution of any general technical problem which the application solved in its specific field. Such solutions of general technical problems in non-specific (general) fields had to be viewed as forming part of the general technical knowledge which a priori was to be attributed to those skilled persons versed in any specific technical field. These principles were applied in a large number of decisions.

In T. 560/89 (OJ 1992, 725) the board took the view that the skilled person would also draw on prior art in other fields which were neither neighbouring nor broader general fields, if prompted to do so because the materials used were related or because of public debate about a technical problem common to both fields. Expanding on this, T. 955/90 added that, in practice, the person skilled in a broader general field would also draw on the narrower, more specialised field of the known main application of the general technology in search of a solution to a problem lying outside the special application of that technology (T. 379/96).

According to T. 454/87 a skilled person specialising in a particular technical field (gas chromatography equipment) would, in the course of his normal professional activity, also observe developments in equipment used in a related technical field (absorption spectral analysis).

In T. 891/91 the board stated that a skilled person in the field of lenses for ophthalmic use, confronted with the technical problem of adhesion and abrasion resistance of a coating made on a surface of the lens, would also refer to the state of the art in the more general field of coated plastic sheets in which the same problems of adhesion and abrasion resistance of the coating arose and of which he was aware.

According to the board in T.1910/11, whether the prior art and the claimed invention belonged to neighbouring technical fields within the meaning of T.176/84 was less a question of whether the relevant implementation parameters were identical than a question of the degree of similarity between the respective problems, boundary conditions and functional concepts. Applying this to the case in hand, it observed that automotive electronics and avionics were traditionally considered to be neighbouring technical fields because they involved similar problems (e.g. interference resistance, robustness and reliability), boundary conditions (e.g. mobility) and functional concepts (e.g. physical/logical separation of the communications systems for safety and maintenance data in the vehicle).

In T.767/89, regarding carpets, the board ruled that wigs were neither a neighbouring technical field nor a broader general one which included the former field. So wigs were not a related technical field in which the person skilled in carpets would have been prompted to seek solutions. The two inventions addressed different problems; the user requirements were not comparable.

Because of the differing security risks, a skilled person could not be expected to search in the field of bulk-goods packaging for ideas for the design of a closure for a means of conveying money (T.675/92).

Further comments on the concept of relevant field are to be found in several other decisions, including the following: T.277/90 (in dentistry, moulding technology and prosthodontics are neighbouring technical fields), T.358/90 (discharging the content of a portable toilet did not lead the skilled person to the field of filling a tank of a chain saw by means of a special kind of container), T.1037/92 (a person skilled in the art of making fuse links for programmable ROMs would also have consulted the documentation in the field of ultraminiaturised integrated switches), T.838/95 (the pharmaceutical and cosmetic fields were immediate neighbours), T.26/98 (the board did not consider the field of electrochemical generators to be a neighbouring field of iontophoresis because, though both fields relied on electrochemical processes, such processes had substantially different purposes and applications and, consequently, had to satisfy different requirements), T.1202/02 (the manufacture of mineral fibres and that of glass fibres were two closely related technical fields irrespective of differences between the raw materials respectively used), T.365/87, T.443/90, T.47/91, T.244/91, T.189/92, T.861/00.

On a different aspect, with regard to the applicant's reference to a remote state of the art, the board gave the following ruling in T.28/87 (OJ 1989, 383); if reference is made in the introduction to the description of an application or a patent to a state of the art which cannot objectively be classified as a relevant field, that state of the art cannot in the course of examination for patentability be applied to the applicant's or patent proprietor's disadvantage as a neighbouring field merely on account of that reference.

8.3. Skilled person – level of knowledge

The same level of skill has to be applied when, for the same invention, the two questions of sufficient disclosure and inventive step have to be considered (T.60/89, OJ 1992, 268;

T. 373/94, **T. 694/92** (OJ 1997, 408) added that, although the same level of skill is applied for both **Art. 56** and **Art. 83 EPC 1973**, the two starting points differ; for inventive step purposes, the skilled man knows only the prior art; for sufficiency of disclosure, he knows the prior art **and** the disclosed invention.

According to **T. 426/88** (OJ 1992, 427) a book providing general teaching in a general technical field covering the invention's specific technical field was part of the general knowledge of a specialist in that specific technical field. When books, representing common general knowledge, described a basic general technical theory or methodology and exemplified the same with specific applications in certain technical fields only, these did not limit the general scope and relevance of such disclosures so as to exclude possible applications in other fields. The appellant had argued that the book, written in German, was not a general reference book consulted by experts in that field in Great Britain. The board, however, adhered to the definition of the state of the art given in **Art. 54 EPC 1973**, according to which no account was taken of the location at which the skilled person exercised his profession.

In **T. 1688/08** the board stated that the language of a patent document alone cannot be decisive for the question of whether or not the skilled person considers the technical content of that document. Otherwise, there would be a differentiation between skilled persons according to the language(s) they speak. This would be against the objective assessment of the inventive step.

In **T. 766/91** the board summarised the normally accepted view that common general knowledge was represented by basic handbooks and textbooks on the subject in question. It was knowledge that an experienced person in this field was expected to have, or at least to be aware of, to the extent that he knew he could look it up in a handbook if he needed it. Statements in such works were used as convenient references to show what was common knowledge. The information as such did not as a rule become such knowledge through publication in a given handbook or textbook; rather by the time it appeared in such works it was already generally known. For this reason, publication in an encyclopaedia, say, could normally be taken as proof that the information was not only known but was common general knowledge. The assertion that something was part of the common general knowledge therefore needed only to be substantiated if challenged by another party or the EPO (**T. 234/93**, **T. 590/94**, **T. 671/94**, **T. 438/97**, **T. 1253/04**, **T. 1641/11**). Where an assertion that something was part of the common general knowledge is challenged, the person making the assertion must provide proof that the alleged subject-matter indeed forms part of the common general knowledge (**T. 438/97**, **T. 329/04**, **T. 941/04**, **T. 690/06**).

In **T. 378/93** the board confirmed this case law, adding that the same applied to articles in scientific periodicals addressed primarily to qualified professionals and enjoying worldwide repute.

In **T. 1540/14** the board held that the common general knowledge of the skilled person is not normally established on the basis of the content of patent documents.

In T. 939/92 (OJ 1996, 309) it was explained that the state of the art could also perfectly well reside solely in the relevant common general knowledge, which, in turn, need not necessarily be in writing, i.e. in textbooks or the like, but might simply be a part of the unwritten "mental furniture" of the average skilled person. In the case of any dispute, however, the extent of the relevant common general knowledge had to be proven, e.g. by documentary or oral evidence.

Numerous publications in the specialist press over a fairly short time, reporting on meetings and research in a particularly active field of technology, could reflect common general knowledge in this field at that time (T. 537/90).

In T. 632/91 the board stated that evidence which did not comprise a comparison of the claimed subject-matter with the state of the art might nevertheless rebut a prima facie assumption that there existed some common general knowledge which would have allowed the skilled person to disregard structural differences in chemical compounds.

8.4. Everyday items from a different technical field

In T. 1043/98 the patent concerned an inflatable gas-bag for a vehicle restraint system, one part being club-shaped and the other generally butterfly-shaped. According to the appellant, the skilled person would immediately arrive at the claimed gas-bag from his knowledge of tennis-ball or baseball construction. This raised the issue of the application of features or solutions drawn from another technical field but which could be considered "everyday items".

In T. 397/87 the board had already pointed out that there was no obvious reason why a skilled person trying to solve a non-trivial problem should have been led to the claimed process by simple examples from everyday life which were unrelated to the problem in question. In T. 349/96, too, the board was unable to see why the fact that different transport containers were used for beer bottles in an everyday context should prompt a skilled person to invent a spinning/winding machine combination with an integrated transport system even if the many citations from the relevant technical field were unable to do this (see also T. 234/91).

In T. 234/96, however, the board concurred with the examining division's view that the skilled person dealing with the practicalities of motorising a dispenser drawer for washing powder had in mind as a model the disc tray of a CD player with push-button electromotor operation, which, at the time of filing the application, was familiar to anyone and which therefore suggested the subject-matter of claim 1. In the board's view, the fact that washing machines and CD players were intrinsically different items serving different purposes did not suffice to prevent the skilled person concerned with the construction of washing machines from taking into consideration the basic principle of automatic tray operation in CD players when designing a dispenser drawer for washing powder.

From a comparison of the above-mentioned decisions, the board in T. 1043/98 concluded that the relevance of such items for inventive step depended very much on the circumstances of the individual case. It agreed that persons skilled in developing the gas-

bags in question would include tennis or baseball players. It could not, however, share the appellant's view that to solve the problem addressed by the invention the skilled person would draw on what he might know about tennis-ball or baseball construction. The main reason was that the gas-bag was not intended to be spherical in shape. It was therefore unlikely that the skilled person would take as his starting point an object which was the epitome of a sphere (see T 477/96, where the board also concluded that everyday experience was not relevant to the technical field of the invention).

9. Assessment of inventive step

9.1. Treatment of technical and non-technical features

The boards of appeal have been concerned with the assessment of inventive step in cases where the invention consisted of a mix of technical and non-technical features. Decision T 154/04 (OJ 2008, 46) analysed the case law relating to the patentability of inventions and summarised the main principles concerning mixed inventions as follows: for examining patentability of an invention in respect of a claim, the claim must be construed to determine the technical features of the invention, i.e. the features which contribute to the technical character of the invention. It is legitimate to have a mix of technical and "non-technical" features appearing in a claim, in which the non-technical features may even form a dominating part of the claimed subject matter. Novelty and inventive step, however, can be based only on technical features, which thus have to be clearly defined in the claim. Non-technical features, to the extent that they do not interact with the technical subject matter of the claim for solving a technical problem, i.e. non-technical features "as such", do not provide a technical contribution to the prior art and are thus ignored in assessing novelty and inventive step. Finally, for the purpose of the problem-and-solution approach, the problem must be a technical problem which the skilled person in the particular technical field might be asked to solve at the relevant priority date. The technical problem may be formulated using an aim to be achieved in a non-technical field, and which is thus not part of the technical contribution provided by the invention to the prior art. This may be done in particular to define a constraint that has to be met (even if the aim stems from an a posteriori knowledge of the invention).

These principles have indeed a clear and consistent basis in the EPC and in the case law of the boards of appeal and the Enlarged Board of Appeal, in particular. In this connection, the Enlarged Board of Appeal noted in G 3/08 (OJ 2011, 10) that it was not aware of any divergence in this case law, suggesting that the boards were in general quite comfortable with it, and concluded that it would appear that the case law had created a practicable system for delimiting the innovations for which a patent may be granted (see also T 116/06, T 1769/10).

9.1.1 Technical character of an invention

In order to be patentable, the subject-matter claimed must therefore have a "technical character" or to be more precise – involve a "technical teaching", ie an instruction addressed to a skilled person as to how to solve a particular technical problem using particular technical means (T 154/04, OJ 2008, 46). Having technical character is an

implicit requisite of an "invention" within the meaning of Art. 52(1) EPC 1973 (requirement of "technicality"). Art. 52(2) EPC 1973 does not exclude from patentability any subject matter or activity having technical character, even if it is related to the items listed in this provision since these items are only excluded "as such" (Art. 52(3) EPC 1973) (T 154/04, OJ 2008, 46). Technical character results either from the physical features of an entity or (for a method) from the use of technical means. While an invention as a whole may possess technical character, it may nevertheless legitimately include both technical and non-technical features (T 641/00, OJ 2003, 352, T 1543/06). Decisive for the presence of a (potentially patentable) invention is the inherent character of the claimed subject-matter (T 154/04).

The case law identifies the requirement of technical character as **separate to and independent** of the remaining requirements of Art. 52(1) EPC 1973, in particular novelty and inventive step, compliance with which can therefore be assessed without having recourse to the prior art (T 154/04). The legal definition of Art. 56 EPC is to be put into context with the remaining patentability requirements of Art. 52 to 57 EPC these articles implying the general principles that patents shall be available for inventions in all fields of technology and that technical character is a sine qua non for an invention within the meaning of the EPC (T 931/95, OJ 2001, 441; T 935/97, T 1173/97, OJ 1999, 609; T 641/00, OJ 2003, 352; T 914/02, T 154/04, OJ 2008, 46, T 1227/05, OJ 2007, 574). According to T 208/84 (OJ 1987, 14), one indication of technical character is that the method has an **overall technical effect**, such as controlling some physical process (see also T 313/10). Thus, following T 258/03, an invention claiming technical aspects possesses overall technical character, even if it is "mixed" (with both technical and non-technical aspects) (T 859/07, T 188/11, T 414/12, T 1331/12).

In T 914/02 the board held that the involvement of technical considerations is not sufficient for a method which may exclusively be carried out mentally to have technical character. Technical character may be provided through the technical implementation of the method, resulting in the method providing a tangible, technical effect, such as the provision of a physical entity as the resulting product or a non-abstract activity, such as through the use of technical means. The board rejected a claim directed to an invention involving technical considerations and encompassing technical embodiments on the grounds that the invention as claimed could also be exclusively performed by purely mental acts excluded from patentability under Art. 52(2)(c) EPC (see T 619/02, OJ 2007, 63; T 388/04, OJ 2007, 16).

In T 388/04 (OJ 2007, 016) the board took the view that subject-matter or activities that are excluded from patentability under Art. 52(2) and (3) EPC 1973 remain so even where they imply the possibility of making use of unspecified technical means.

In T 930/05 the application was concerned with a method for modelling a process network. The board held that the method lacked technical character because though the claimed subject-matter comprised technical embodiments, implementations that could be deemed non-technical were also conceivable.

In [T.2079/10](#) the application was concerned with an electronic control apparatus and method for controlling alarm systems of a cellular structure. The board held that a purely non-technical interpretation of the claim's subject-matter was not possible because both the input and output grids had to be considered. While the activation signals generated on the output side could also be used to control alarm systems based on monetary values, the physical sensor signals on the input side always produced technical parameters that had to be borne in mind when interpreting the claim's subject-matter.

In [T.339/13](#) the application was concerned with a virtual pet that was capable of giving "haptic feedback" producing, for instance, tactile sensations, such as vibrations or pulses, or visual/audio effects. The board noted that the owner of a toy had to be willing to accept the toy's behaviour as real. The board accepted that in the context of virtual pets achieving the reliable and reproducible perception of a physical interaction with the real pet was a technical problem. Moreover, the board found that the invention solved this problem with technical means, namely a reciprocating cursor movement and haptic feedback.

In [T.1375/11](#) the invention concerned a gaming and/or entertainment device. It held that the problem underlying the claim was how to improve user ergonomics – specifically how to improve the visibility of bets placed, thereby increasing user convenience in order to enable users to play fatigue-free while also continuously keeping track of play progress. The board was in no doubt that how to improve **ergonomics** was a technical problem, citing [T.1296/05](#). It also referred to the approach taken in [T.862/10](#), in which it had been held, that both the problem and its solution were technical because they depended not on psychological or subjective factors, but on technical parameters (based, among other things, on human physiology) that could be precisely defined.

The board in [T.548/13](#) held that the only distinguishing feature, requiring the security features to show different views of the same image on the front and back of a value document, was non-technical. It conceded that it made the document more difficult to counterfeit, but two different motifs could just as easily be used.

The issue of technical character is analysed in detail in chapter [I.A.1.1](#). "Technical character of an invention".

9.1.2 Inventions having both technical and non-technical features

"Mixed" inventions are inventions having both technical and non-technical features, where "non-technical" relates to matter which under [Art. 52\(2\) EPC](#) is not to be regarded as an invention within the meaning of [Art. 52\(1\) EPC](#) ([T.1543/06](#)). In claims comprising technical and non-technical features, each feature has to be evaluated to see if, in the context of the invention, it contributes to the technical character of the claimed subject-matter, since this is relevant for assessing inventive step (Guidelines G-II, 2 – November 2018 version).

It is legitimate to have a mix of technical and "non-technical" features appearing in a claim, in which the non-technical features may even form a **dominating part** of the claimed subject matter ([T.26/86](#), OJ 1988, 19; [T.769/92](#), OJ 1995, 525; [T.641/00](#), OJ 2003, 352; [T.531/03](#); [T.154/04](#), OJ 2008, 46; [T.1784/06](#)).

When assessing the inventive step of such a mixed-type invention, all those features which contribute to the technical character of the invention are taken into account. These also include the features which, when taken in isolation, are non-technical, but do, in the context of the invention, contribute to producing a technical effect serving a technical purpose, thereby contributing to the technical character of the invention. However, features which do not contribute to the technical character of the invention cannot support the presence of an inventive step (T 641/00). Such a situation may arise, for instance, if a feature contributes only to the solution of a non-technical problem, e.g. a problem in a field excluded from patentability (Guidelines G-VII, 5.4 – November 2018 version).

In T 26/86 (OJ 1988, 19) the board held that an invention must be **assessed as a whole**. If it makes use of both technical and non-technical means, the use of non-technical means does not detract from the technical character of the overall teaching. The EPC does not ask that a patentable invention be exclusively or largely of a technical nature; in other words, it does not prohibit the patenting of inventions consisting of a mix of technical and non-technical elements even if the technical part is not the dominating part of the invention. The board, although allowing a mix of technical and non-technical features to be claimed, considered the technical part of the invention as the basis for assessing inventive step (see T 641/00, OJ 2003, 352, point 4 of the Reasons; see also T 209/91).

The inventive step requirement of Art. 52(1) and 56 EPC 1973 is assessed using the well-established problem-solution approach, which is fundamentally technical in nature (T 172/03). This requires analysis of the invention in terms of a technical solution to a technical problem. When applied to "mixed" inventions, such an approach must necessarily differentiate between an invention's technical and non-technical features.

According to the established case law, features of an invention that do not have a technical effect or do not interact with the remaining features of the invention so as to result in a technical functional contribution cannot be considered to contribute to an inventive step within the meaning of Art. 56 EPC. This is not only the case when the features themselves do not contribute to the technical character of the invention (T 641/00, OJ 2003, 352; T 258/03, OJ 2004, 575; and T 531/03; see also T 456/90, T 931/95, T 27/97, T 258/97, T 1121/02 and T 1784/06), but also when the features may in principle be qualified as being of a technical nature but do not have any technical function in the context of the claimed invention (T 619/02, OJ 2007, 63) (see for instance T 72/95, T 157/97, T 158/97, T 176/97). In addition, this is so regardless of whether the features are themselves obvious or not (see T 72/95, T 157/97, T 158/97 and T 176/97).

In T 641/00 (OJ 2003, 352), the board had already held that features of the invention which did not form part of the technical solution to the technical problem had to be disregarded in the assessment of inventive step (T 931/95, OJ 2001, 441); T 1121/02, T 1543/06, T 336/07, T 859/07, T 859/07). In T 531/03 the board confirmed the principles set out in T 641/00 and stated that, in the assessment of inventive step, features relating to a non-invention within the meaning of Art. 52(2) EPC 1973 (so-called "non-technical features") could not support the presence of an inventive step (see also T 1543/06). In T 258/03 (OJ 2004, 575), the board held that the invention was to be assessed by taking account only of those features which contributed to a technical character. The features that made

a technical contribution therefore needed to be determined. In T.1543/06 the board stated that the principle as expressed in T.641/00 (OJ 2003, 352) could be also reformulated as follows: an invention which **as a whole** falls outside the exclusion zone of Art. 52(2) EPC 1973 (i.e. is technical in character) cannot rely on excluded subject matter alone, even if novel and non-obvious (in the colloquial sense of the word), for it to be considered to meet the requirement of inventive step (see also T.336/07).

The presence of an inventive step can only be established on the basis of the technical aspects of both the distinguishing features of, and the effects achieved by the claimed invention over the closest state of the art (T.641/00, OJ 2003, 352) (see also T.619/02, OJ 2007, 63). The presence of an inventive step cannot rely on excluded (non-technical) subject matter alone, however original it may be (see also T.336/07).

It is the established case law of the boards of appeal (see G.3/08, OJ 2011, 10; T.258/03, and T.424/03, T.313/10) that claimed subject-matter specifying at least one feature not falling within the ambit of Art. 52(2) EPC is not excluded from patentability by the provisions of Art. 52(2) and (3) EPC. Features which would, taken in isolation, belong to the matters excluded from patentability by Art. 52(2) EPC may nonetheless contribute to the technical character of a claimed invention, and therefore cannot be discarded in the consideration of the inventive step. This principle was already laid down, albeit in the context of the so-called "contribution approach", in one of the earliest decisions of the boards of appeal to deal with Art. 52(2) EPC, namely T.208/84 (point 4 ff. of the Reasons) (see also T.1784/06).

In T.258/03 (OJ 2004, 575) the board noted that, taking into account both the fact that a mix of technical and non-technical features may be regarded as an invention within the meaning of Art. 52(1) EPC 1973, and the fact that prior art should not be considered when deciding whether claimed subject-matter is such an invention, one compelling reason for not refusing subject-matter consisting of technical and non-technical features under Art. 52(2) EPC 1973 is simply that the technical features may in themselves turn out to fulfil all the requirements of Art. 52(1) EPC 1973. It is often difficult to separate a claim into technical and non-technical features, and an invention may have technical aspects which are hidden in a largely non-technical context. Such technical aspects may be easier to identify within the framework of the examination as to inventive step, which, in accordance with the jurisprudence of the boards of appeal, is concerned with the technical aspects of an invention. Thus, in addition to the restrictive wording of Art. 52(3) EPC 1973 limiting the applicability of Art. 52(2) EPC 1973, there may be practical reasons for generally regarding mixes of technical and non-technical features as inventions within the meaning of Art. 52(1) EPC 1973.

The methodology applied by the boards of appeal of the EPO in dealing with "mixed" inventions has been summarised in T.1543/06 (see also T.859/07).

9.1.3 Problem and solution approach when applied to "mixed" inventions

a) General issues

The boards of appeal use the problem and solution approach to determine whether an inventive step is involved. This requires analysis of the invention in terms of a technical solution to a technical problem. Since both the solution and the problem solved by an invention have to be of a technical nature, the problem and solution approach might raise questions when the invention comprises non-technical aspects or elements. Such difficulties are to be resolved by taking due care to define the **technical field** to which the invention belongs, the scope of technical expertise and skills expected to be applied by the technical person in that particular technical field, and the correct formulation of the technical problem actually solved (T.1177/97). Such an approach must necessarily differentiate between technical and non-technical features when applied to "mixed" or hybrid inventions (T.1543/06).

b) The Comvik approach

The Comvik approach was applied in T.641/00 (OJ 2003, 352). It is a conventional application of the problem and solution approach where the differences with respect to the closest prior art are determined and only those that contribute to the technical character are considered for inventive step. It is well established that non-technical elements do not contribute to inventive step. That is the basic principle of T.641/00 (see T.1463/11, T.630/11).

Comvik sets out an approach to ensuring that non-technical issues do not influence the decision on inventive step. It is to include the non-technical elements in the statement of the technical problem to which the skilled person seeks a solution. Most often, this is in the form of non-technical requirements (T.630/11).

The Comvik approach may be more appropriate where the technical part is more substantial and/or relevant prior art exists. It has the advantage that any non-technical feature known from this prior art will not appear as a difference and does not need to be considered in the subsequent steps, thus not requiring the step of judging whether it makes a technical contribution. Furthermore, this approach is less abstract since the claimed features can be analysed against concrete prior art (see T.756/06 and T.928/03). Thus, when assessing the inventive step of the subject-matter of such a claim, all features of a technical character are taken into account, whereas features which do not form part of a technical solution to a technical problem have to be disregarded in this assessment (T.641/00, OJ 2003, 352; T.1344/09; T.1543/06). The board stated that "... where a feature cannot be considered as contributing to the solution of any technical problem by providing a technical effect it has no significance for the purpose of assessing inventive step."

In T.1461/12 the board noted that the appellant had taken issue with the fact that the assessment of inventive step based on T.641/00 involved referring to Art. 52(2) and (3) EPC – and thereby allegedly mixed the requirements of Art. 52 and 56 EPC in an inappropriate manner. In this respect, the board pointed out that the "contribution

approach" is typically understood as a test determining whether the difference between the claimed invention and the prior art lies exclusively in a field excluded from patentability under Art. 52(2) EPC and, if so, finding that claimed invention as a whole does not comply with Art. 52(2) and (3) EPC. That is, according to the contribution approach, compliance of an invention with Art. 52(2) and (3) EPC is determined only in view of its contribution over the prior art. This approach was abandoned in T.1173/97 (OJ 1999, 609, point 8 of the Reasons; see also G.3/08, OJ 2011, 10, point 10.6 of the Reasons), which found that compliance with Art. 52(2) and (3) EPC can be established by features already known in the art. The approach based on T.641/00 (the Comvik approach) relates to the assessment of whether an invention comprising technical and non-technical features involves an inventive step over the prior art. Evidently, an inventive step vis-à-vis the prior art depends on the "contribution" that the claimed invention makes over the prior art. Establishing this contribution is necessary in any method of assessing inventive step, T.641/00 included, but is not equivalent to the "contribution approach".

The board specified that an inventive step can only be acknowledged for an invention which makes a technical contribution to the art (see, inter alia, T.38/86, OJ 1990, 384; T.1173/97; T.1784/06), i.e. **a contribution in a technical field**. Furthermore, the jurisprudence of the boards of appeal has developed the understanding that the subject-matter excluded from patentability by way of example in Art. 52(2) and (3) EPC concerns fields considered to be non-technical (see T.931/95, OJ 2001, 441; and T.1173/97). It is true, therefore, that the established way of assessing inventive step under Art. 56 EPC makes reference to Art. 52 EPC. However, this does not mean that the assessment of both requirements is "mixed" (see on this point T.1784/06, point 2.2 of the Reasons). Contrary to the appellant's argument, the **assessment** of the requirements of Art. 52 and 56 EPC **remains separate**.

In T.528/07 the invention, a computer system, consisted of a mixture of technical and non-technical features. The board stated that in order to examine this type of subject-matter the board would normally apply the "Comvik approach" (see T.641/00). The appellant had, however, argued that since Art. 52(1) EPC had been brought into line with Art. 27(1) TRIPS, it had to be interpreted in the light of the object and purpose of TRIPS and that would require a modification of the Comvik approach. The board held that under Art. 27(1) TRIPS a patent shall only be granted if it is new and involves an inventive step. TRIPS however does not stipulate how these requirements are to be applied. The TRIPS member states are free to adopt different standards for each patentability requirement, such as inventive step. The Comvik approach is one facet of the standard applied by the EPO.

In T.531/03 the board stated that an attempt to take into account the contribution of non-technical and technical aspects on an equal footing in the assessment of inventive step would not be in conformity with the EPC, since the presence of inventive step would in such an approach be attributed to features which are defined in the EPC as not being an invention.

In T.912/05 the board noted that, according to the principles set out in decision T.641/00 (OJ 2003, 352) and confirmed in T.258/03 (OJ 2004, 575), an invention within the meaning of Art. 52(1) EPC is to be assessed with respect to inventive step by taking account of only

those features which contribute to its technical character, whereas features making no such contribution cannot support the presence of inventive step. Although the board agreed with the case law referred to above, it found that in the case at issue it was not necessary to seek to separate features that were essentially business-related, and thus not relevant for the solution of a technical problem, from those features that, as essentially technical, should be taken into account when assessing inventive step. It concluded that the assessment of the inventive step of a business-related method might be possible without a preliminary clear-cut separation between business-related features and technical features.

In T. 756/06 the board noted that another approach is also generally followed by the boards of appeal (see also T. 1344/09). In the approach followed in T. 931/95 (OJ 2001, 441), there is an initial analysis of the technical character of the features of the claim and then a consideration of the inventive step of only those features. This approach is typically used for inventions that are essentially business methods running on more or less notoriously known computer hardware.

c) Non-technical features and technical contribution

Art. 56 EPC requires a non-obvious technical contribution.

In T. 1784/06 the board confirmed the Comvik approach that only features contributing to the technical character of claimed subject-matter enter into the examination for inventive step (T. 641/00, OJ 2003, 352; T. 1834/10). As patents can be granted only for technical subject-matter, the consequence is that a (non-obvious) contribution which justifies the grant of a patent has to have a technical character. It would appear paradoxical to recognise an inventive step on the basis of a non-technical innovation (such as an organisational, administrative, commercial or mathematical algorithm) having no technical implication other than the (obvious) desire for its implementation on a general-purpose computer. Where an intrinsically non-technical solution (here: a mathematical algorithm) seeks to derive a technical character from the problem solved, the problem must be technical. Otherwise, the solution remains non-technical and does not enter into the examination for an inventive step (T. 566/11). The board agreed with the statement that a non-technical problem can have a technical solution. However, where an intrinsically non-technical solution (mathematical algorithm) seeks to derive a technical character from the problem solved, the problem must be technical. According to the appellant, claimed subject-matter as a whole should be examined for the presence of an inventive step once the subject-matter as a whole has been found to meet the technology criterion of Art. 52(1), (2) and (3) EPC. The appellant argued that Art. 56 EPC 1973 should be applied independently of Art. 52(1), (2) and (3) EPC because Art. 52(2) EPC has to be applied independently of Art. 56 EPC. The board pointed out that Art. 52(1) EPC has always been understood as referring to technical inventions. It also noted that Opinion G. 3/08 (OJ 2011, 10) of the Enlarged Board of Appeal backed the Comvik approach rather than raising any objection to it (points 10.13.1 and 10.13.2 of the Reasons).

In T. 336/14 the question which arose first was whether the distinguishing features of constituted presentations of information as such within the meaning of Art. 52(2)(d) and

(3) EPC and thus were non-technical features which do not contribute to the technical character of claim 1. The board was aware of decisions proposing the concept of "technical novelty" (see G 2/88, OJ 1990, 93; T 154/04, OJ 2008, 46; T 619/98). The board, however, followed the well-established approach of treating potentially non-technical features under the umbrella of inventive step (see e.g. T 641/00, OJ 2003, 352).

The board noted that features relating to subject-matter excluded under Art. 52(2) EPC may only contribute to an inventive step if they bring about an overall technical effect, i.e. if they contribute to the technical character of the claim by interacting with its technical features to solve a technical problem. Otherwise, they are to be disregarded in the assessment of inventiveness (see e.g. T 641/00, T 154/04, T 1143/06). This is, in principle, also applied in prominent national decisions of the German Federal Court of Justice (BGH) concerned with the matter of "presentations of information" (see e.g. BGH, X ZR 3/12, GRUR 2013, 275 – Routenplanung; BGH, X ZR 27/12, GRUR 2013, 909 – Fahrzeugnavigationsystem) and the Court of Appeal of England and Wales dealing with "programs for computers" (see Court of Appeal decision of 8 October 2008 – Symbian Ltd v. Comptroller General of Patents [2008] EWCA Civ 1066). The board stated that, in the assessment of whether a feature provides a technical contribution, the feature is not to be taken by itself, but its technical character is to be decided by the effect it brings about after being added to an object which did not comprise that feature before (T 119/88, OJ 1990, 395, point 4.1 of the Reasons). Therefore, the board had to determine whether the distinguishing features of claim bring about a credible technical effect and hence solve a technical problem.

In T 1121/02 the board referred to T 931/95 (OJ 2001, 441) and T 641/00 (OJ 2003, 352) and confirmed that features making no contribution to technical character could not support the presence of an inventive step. In T 258/03 (OJ 2004, 575), the board held that the invention was to be assessed by taking account only of those features which contributed to a technical character (see eg. T 784/06, T 2050/07). The features that made a technical contribution therefore needed to be determined.

In T 1145/10 the board stated that where specific technical features or functionality of the standard computerised system are required to implement the non-technical features, those specific well-known technical features and functionality should be clearly identified.

The closest prior art is usually chosen on the basis of the technical problem to be solved and/or the technical features of the invention. The closest prior art, which is part of the state of the art, does not normally have to include non-technical features of the claim (see T 1379/11). On the other hand, features which would, when taken in isolation, be considered non-technical may nonetheless impose technical requirements or contribute to the technical character of the invention (see e.g. G 3/08, OJ 2011, 10, point 12.2.2 of the Reasons; T 1145/10). Such features should be taken into account when choosing a starting point for assessing inventive step (see also T 1930/13). The non-technical purpose of an invention may determine the technical environment needed (see T 1145/10).

In T 483/11 the board held that a feature does not automatically inherit the technical character of the context in which it occurs. The feature must, itself, make a contribution to the technical context or the technical aspects of the invention (see also T 1722/12).

In T 2488/11 the board held that logging or documenting the execution details of tests carried out in a laboratory, irrespective of the technicality of the tests themselves was not technical. The board also held that the mere automation of a non-technical task by means of notorious technical means cannot involve an inventive step.

d) Non-technical features and interaction with technical subject matter

In T 154/04 the board stated that a non-technical feature may interact with technical elements so as to produce a technical effect, e.g. by its application in the technical solution of a technical problem. Non-technical features, to the extent that they do not interact with the technical subject matter of the claim for solving a technical problem, i.e. non-technical features "as such", do not provide a **technical contribution** to the prior art and are thus ignored in assessing novelty and inventive step. This is the approach used by board in T 154/04 (OJ 2008, 46) to determine the technical features in a claim if technical and non-technical aspects are tightly intermingled in a mixed type claim, as is typically the case with computer-implemented inventions (see, for example, decisions T 619/02 and T 172/03) (see also T 641/00, OJ 2003, 352; T 1505/05; T 477/08; T 1358/09).

In T 603/89 (OJ 1992, 230) the board pointed out that the subject-matter of a "mix" claim is not excluded from patentability under Art. 52(2) and (3) EPC 1973 when, but only when, the **non-technical elements interacted** with the known technical elements in order to produce a technical effect (see T 26/86, OJ 1988, 19). In the absence of such an interaction – when the technical elements were only a support for the non-technical elements but did not otherwise co-operate therewith – the invention did not make use of technical means and could not therefore be granted (see T 158/88, OJ 1991, 566; T 1670/07).

e) Technical implementation of excluded subject-matter

In T 336/07 the board held that the mere fact that subject-matter (here rules for playing games), which is excluded per se under Art. 52(2)(c) EPC 1973, is technically implemented could not form the basis for inventive step. Inventive step can be based only on the particular manner of implementation of such subject matter. To this end it is therefore necessary to ask how the per se excluded subject matter was implemented. A consideration of the particular manner of implementation has to focus on **any further technical advantages** or effects associated with the specific features of implementation over and above the effects and advantages inherent in the excluded subject-matter (see also T 1543/06). The board concluded that the subject-matter of the claims did not involve an inventive step (on the technical implementation of game rules, see also T 1782/09 and T 1225/10). In these two decisions the board stated that "game rules" form part of "the regulatory framework agreed between [or with] players concerning conduct, conventions and conditions that are meaningful only in a gaming context. They govern the conduct and actions of the players during game play.

In [T.1543/06](#) the board stated that it could not have been the legislator's purpose and intent on the one hand to exclude from patent protection excluded subject matter, while on the other hand awarding protection to a technical implementation thereof, where the only identifiable contribution of the claimed technical implementation to the state of the art is the excluded subject-matter itself. It was noted that here the term "contribution" encompasses both **means** (i.e. tangible features of the implementation) and **effects** resulting from the implementation. In that case, [Art. 52\(2\) EPC](#) would be reduced to a mere requirement as to form, easily circumvented. The board believed it was intended as substantive in nature, whatever considerations may have been the source of this exclusion at the time of its adoption. It followed that **the mere technical implementation** of excluded subject-matter per se could not form the basis for inventive step (see also [T.1793/07](#)). The board concluded that inventive step could be based only on the particular manner of implementation. To this end it was therefore necessary to ask how the per se excluded subject-matter (e.g. a game or business method) is implemented ([T.859/07](#), [T.414/12](#)).

In the context of the problem-solution approach this can be rephrased as a fictional technical problem in which the per se excluded subject matter appears as an aim to be achieved, see [T.641/00](#) (Headnote II). Where such excluded subject matter is novel such a formulation of the problem seemingly implies that such matter may be regarded as a given in the assessment of inventive step, which thus appears to depart from what is in fact a hidden starting point. The board viewed this fiction as an artefact of the systematic use of the problem-solution approach for assessing inventive step and the need to differentiate between excluded and non-excluded matter. This should not detract from the basic tenet that excluded subject-matter cannot form the sole basis for a patentable invention. A consideration of the particular manner of implementation must focus on **any further technical advantages** or effects associated with the specific features of implementation over and above the effects and advantages inherent in the excluded subject-matter ([T.336/07](#)). The latter are at best to be regarded as incidental to that implementation.

The board went on to state that the explicit requirement of a **"further" technical effect** was first formulated for computer-related inventions in decisions [T.1173/97](#) (OJ 1999, 609) (see also [T.935/97](#)), but the same principle holds also for other categories of excluded subject-matter which may inherently possess some "technical" effect. In fact, inherent and arguably technical effects may be easily identified for practically all excluded subject-matter, for example such a simple one as reducing time when using or performing it. This is why it needs to be stressed that the **"further" technical effect** can not be the same one which is **inherent** in the excluded subject-matter itself ([T.2449/10](#), [T.1225/10](#), [T.1547/09](#), [T.1782/09](#), [T.2127/09](#), [T.1331/12](#)). This consideration of the specific implementation must, moreover, be from the point of view of the relevant skilled person under [Art. 56 EPC](#), who may be identified on the basis of the invention's technical character. This was analogous to the approach of [T.928/03](#) (point 3.2 of the Reasons), which considered the actual contribution of each feature to the technical character by, for each feature, stripping away its non-technical content. Thus, "the extent to which the characterizing features contribute to the technical character ... in relation to the effects achieved by those features" had to be determined ([T.1023/06](#), [T.336/07](#) and [T.859/07](#)). The approach in [T.1543/06](#) was based foremost on [T.641/00](#) (OJ 2003, 352) ([T.1331/12](#)).

In T.1173/97 (OJ 1999, 609) the board held that a computer program product is not excluded from patentability under Art. 52(2) and (3) EPC 1973 if, when it is run on a computer, it produces a **further technical effect** which goes beyond the "normal" physical interactions between program (software) and computer (hardware)" (see point 9.4 of the Reasons). The board also held that, for the purpose of determining the extent of the exclusion under Art. 52(2) and (3) EPC 1973, the "further" technical effect could, in its opinion, be known in the prior art. Determining the technical contribution which an invention achieves with respect to the prior art is therefore more appropriate for the purpose of examining novelty and inventive step than for deciding on possible exclusion under Art. 52(2) and (3) EPC (see also T.1461/12, T.556/14).

In T.1755/10 the board noted that in the light of Art. 52(1), (2) and (3) EPC, Art. 56 EPC 1973 requires a **non-obvious** technical contribution (see e.g. T.641/00, OJ 2003, 352; T.1784/06). However, non-technical aspects cannot meet that requirement. In the case at issue, as the overall goal of the claimed method (determining commissions) was not technical, the software concept could not derive any (further) technical character from that goal. In fact, the board judged that no "further" technical effect was present at all. The board made it clear that, in the absence of any other potential "further" technical effect, the mere use of a specific software solution did not amount to a technical implementation (which would have to be considered in the inventive step examination). It held that the frequent general argument that modified software causes a modified behaviour of the computer and should for that very reason (eo ipso) be considered as a technical implementation means was insufficient. Hence, a **"software implementation fallacy"** might be added to a pertinent gallery established recently by the board (see T.1670/07). The board also held that even a more specific program structure within the data model did not constitute a technical implementation by itself as the alleged technical effect was limited to the general observation that modified software results in a modified operation of the computer. This was just another way of saying that software interacts with hardware and thus was not sufficient to establish a "further" technical effect. Consequently, even the more specific programming structure did not enter into the examination for an inventive step.

In T.928/03 the board stated that in applying the Comvik approach **in a fair manner**, its purpose must be borne in mind: on the one hand, the approach is to make sure that non-technical aspects do not support a finding of inventiveness; on the other hand, actual contributions to the technical character by any feature of an invention must be taken into account when assessing inventive step. In this context, a game rule constraint has to be distinguished carefully from its technical implementation (T.1461/12).

In T.1834/10 the board held that the combination of two types of non-inventions (presentation of information, computer program) is not enough to define a technical contribution (T.1755/10, "software implementation fallacy").

9.1.4 The aim to be achieved in the formulation of the technical problem

For the purpose of the problem-and-solution approach developed as a test for whether an invention meets the requirement of inventive step, the problem must be a technical one

(T. 641/00). The definition of the technical problem is difficult if the actual novel and creative concept making up the core of the claimed invention resides in the realm outside any technological field, as is frequently the case with computer-implemented inventions. Defining the problem without referring to this non-technical part of the invention, if at all possible, would generally result either in an unintelligible vestigial definition, or in a contrived statement that does not adequately reflect the real **technical contribution** provided to the prior art (T. 154/04, OJ 2008, 46).

In T. 641/00 (OJ 2003, 352) the board considered the formulation of the technical problem. Although the technical problem to be solved should not be formulated to contain pointers to the solution or partially anticipate it, merely because some feature appeared in the claim did not mean it was automatically excluded from appearing in the formulation of the problem (see point 7 to the Reasons). In particular where the claim referred to an aim to be achieved in a non-technical field, this aim might legitimately appear in the formulation of the problem as part of the framework of the technical problem which was to be solved in order to avoid taking into account a non-technical contribution when assessing inventive step. The board referred to its decision T. 1053/98, where it had considered it necessary to formulate the technical problem in such a way that "there was no possibility of an inventive step being involved by purely non-technical features". Such a formulation of the problem could refer to the non-technical aspect of the invention as a given framework within which the technical problem was posed. Thus, the board allowed an **aim to be achieved** in a non-technical field to appear in the formulation of the problem as part of the framework of the technical problem that is to be solved, in particular as a constraint that is to be met (see e.g. T. 2063/09). Such a formulation had the additional, desirable effect that the non-technical aspects of the claimed invention, which generally relate to non-patentable desiderata, ideas, and concepts and belong to the phase preceding any invention, are automatically cut out of the assessment of inventive step and cannot be mistaken for technical features positively contributing to inventive step. Since only technical features and aspects of the claimed invention should be taken into account in assessing inventive step, i.e. the innovation must be on the technical side, not in a non-patentable field (see also decisions T. 531/03 and T. 619/02), it was irrelevant whether such a non-technical aim was known before the priority date of the application, or not (see T. 154/04). In the case at issue, the object of the invention as stated in the patent specification was to eliminate inconveniences caused by distributing costs for service and private calls or among different users. That object had to be reformulated to arrive at the technical problem of implementing the GSM system in such a way as to allow user-selectable discrimination between calls for different purposes or by different users (see also in this respect T. 509/07).

The board noted that this approach, although not made explicit before the Comvik decision T. 641/00, was in line with the case law of the boards of appeal as shown, for example, from the analysis of some earlier decisions in decision T. 764/02. In T. 1769/10 the board stated that the case law, as summarised in T. 154/04, had created a practicable system for delimiting the innovations for which a patent may be granted (G. 3/08, OJ 2011, 10).

In T. 1284/04 the board held that the Comvik approach does not consider the non-technical constraints as belonging to the prior art, but rather as belonging to the conception or

motivation phase normally preceding an invention, since they may lead to a technical problem without contributing to its solution. Such aspects have never been taken into account in assessing inventive step, irrespective of whether or not they were known from the prior art (see e.g. T 958/03 and T 506/06).

In T 1463/11 the board noted that if the essential idea of the invention lies in a non-technical field (usually one excluded by Art. 52(2) EPC, such as business, programs, or presentations of information), the objective technical problem often amounts to a statement of requirements that any implementation must meet. The assessment of what is and what is not technical is, therefore, a critical step in the formulation of the objective technical problem. A non-obvious difference over the prior art leads to a positive outcome, if it is deemed technical; but a non-obvious difference that is deemed non-technical leads to a negative outcome. This often leads to opposing definitions of the problem and must therefore be analysed precisely. The formulation of the objective technical problem in terms of non-technical requirements raises the question of what requirements the business person (for example) can actually give to the technically skilled person. Naturally, any requirement that is purely a business matter can be included. However, in the assessment of inventive step, the business person is just as fictional as the skilled person of Art. 56 EPC. The notion of the skilled person is an artificial one; that is the price paid for an objective assessment. So it is too with the business person, who represents an abstraction or shorthand for a separation of business considerations from technical. A real business person, a real technically-skilled person, or a real inventor does not hold such considerations separately from one another.

In T 630/11 the invention provided a "gaming server" with which various online casinos communicate, with the aim of reducing waiting time for players. The issue was how the non-technical aim of reducing waiting time was translated to a (technical) invention and whether there came a point at which technological issues so predominate that further non-technical considerations are no longer separable from them.

The board noted that T 1463/11 warned against allowing the notional business person to require technical means and thus to take technical decisions.

In T 144/11 the board stated that what the board had held in T 1463/11 demonstrated that a careful analysis of which parts of a claimed feature involve a business requirement could help to resolve the grey area between technical and non-technical features. A corollary of this approach, and what is seen in practice, is that a problem of the type "implement the business requirement" will normally never lead to an allowable claim. Either the implementation will be obvious or have no technical effect, or if not, the implementation will have a technical effect that can be used to reformulate the problem essentially to "achieve the effect of the implementation". However, the implementation-type problem is just a starting point that might have to be modified when the implementation is considered. It helps when a technical problem is not apparent at the outset. Examining the business requirements like that and correctly establishing what is to be implemented ensures that all technical matter arising from the idea of the invention and its implementation is taken into account for inventive step. In the Board's view, another constraint is that the technical skilled person must receive a complete description of the business requirement, or else

he would not be able to implement it and should not be providing any input in the non-technical domain.

In T. 2052/12 the invention dealt with parking meters that could credit money on smart cards, but also stored a repayment limit on the smart card to prevent theft. The board held that the claimed method involved technical features carried out by the data carrier, in particular the storing, setting and reducing of the repayment limit, the checking of the reimbursement value and its contingent addition to the memory value, and the checking of key information identifying the communication facility's credit authorization. It held that these technical features brought about technical effects beyond the mere implementation of the claimed method in such a way as to achieve the aims corresponding to the non-technical features.

9.1.5 Credible technical effects

The assessment of inventive step can only be based on those elements and aspects of the invention in respect of which a technical effect can be established. Whether an invention causes a technical effect is essentially a question of fact (T. 1461/12).

In T. 1958/13 board was not satisfied that they could be regarded as objectively credible technical effects for the purpose of formulating the objective problem to be solved (with reference to T. 1567/05, T. 1841/06 and T. 407/11; see also T. 336/14). While the EPO has a duty to determine such facts in examination proceedings, the onus is upon the applicant to cooperate in said determination, in particular in the event of doubt (T. 258/97, point 7 of the Reasons; see also T. 27/97, T. 953/04 and T. 1044/07).

Claim 1 was directed to a terminal made up of a touch-screen display and a controller **configured for detecting gestures** on that device. The appellant argued that the so-called "single-drag gesture" according to claimed feature had the effect of making text editing more convenient or simpler for the user and thus better compared to the solution of D2. The board regarded such gesture definition – whether deemed to be technical or non-technical – as a preliminarily obtained precondition, i.e. a user-specific fact, to be taken into account in the user interface design as belonging to the conception or motivation phase normally preceding an invention (see e.g. T. 482/02 of 13 December 2005; T. 1284/04). Although the board deemed those effects, in principle, to be technical effects, since in the end they **aim at providing tools** which serve or assist user activities (see e.g. T. 643/00), the question whether they were actually achieved depended exclusively on **subjective user skills or preferences**. Therefore, the board was not satisfied that they could be regarded as objectively credible technical effects for the purpose of formulating the objective problem to be solved (see also T. 1567/05, T. 1841/06 and T. 407/11; see also T. 77/14 on gesture-based functions).

In T. 953/04 the board followed decision T. 258/97 and noted that it is incumbent on the appellant to cooperate in the determination of the relevant technical features of an invention in the event of doubt. If not, these features are to be ignored in assessing inventive step if the doubts regarding their technical character cannot be resolved (see also decision T. 27/97). Against the background of continuing doubts regarding the

technical content of the invention and **lacking cooperation** of the appellant in clarifying the issue, the board considered itself barred from arriving at a positive judgment on inventive step so that the appeal could not be allowed.

In T 823/07 the board, following decision T 1143/06, stated that the manner how cognitive content is presented to the user may only contribute to the technical solution of a technical problem if the manner of presentation (exceptionally) shows a **credible technical effect** (see also T 1575/07, T 1741/08, T 1562/11). Non-technical features and aspects of an invention should not be given any weight in assessing inventive step. If they belong to the general framework in which the invention evolves, they may be used in formulating the relevant technical problem (see decision T 641/00, OJ 2003, 352; see also T 77/14). In the present case, however, there was no proof of any such technical effect of the concept of presenting information, beyond the alleged advantages which concern the mental and cognitive activities of the user. The only credible technical effects result from the computer implementation of this concept. This circumstance distinguishes the case from the decisions cited by the appellant in support of its arguments (T 643/00, T 928/03 and T 333/95). In all these decisions, the board concluded on the existence of a technical contribution over the prior art. The technical contribution resulted from overcoming physical limitations of the size and resolution of computer screens (T 643/00, T 928/03) and from the functions of a "new input device" conferring technical character (T 333/95). None of the decisions derives the technical character of a feature or activity from the mental effort required or any similar effect; these are only secondary considerations. Moreover, the board noted that in the context of inventive step, caution is required in applying old decisions concerning non-technical subject-matter like decision T 333/95 since the relevant case law has experienced some important development as explained in decision T 154/04. In the case at issue, the only relevant technical aspects of the invention were standard programming features for implementing the idea of displaying search results in connection with supplier logos on a computer system. The programming and implementation of this idea was obvious in the light of the prior art. For these reasons, the invention did not meet the requirement of inventive step.

In T 258/97 the invention related to an image communication apparatus. The board referred to T 27/97, where it was stated that an abstract algorithm was relevant to inventive step only if a technical effect could be established which was causally linked to the algorithm, such that the technical effect provided a contribution to the solution of a technical problem and thereby conferred a "technical character" on the algorithm. Therefore, the board ruled that an assessment of inventive step could only be based on those elements and aspects of the invention in respect of which a technical effect could be established. Whether an invention caused a technical effect was essentially a question of fact.

9.1.6 Assessment of features relating to a presentation of information

When deciding if a feature relating to the presentation of information is technical or not, what has to be considered is whether or not it contributes to solving a technical problem. The fact that mental activities are involved does not on its own render the subject-matter

non-technical (T.643/00, T.336/14). However, a feature that solely addresses a user's **subjective preferences** does not solve a technical problem (T.1567/05).

For further information on the technical character of features relating to the presentation of information and display of data, see chapter I.A.2.3. "Aesthetic creations" and I.A.2.6. "Presentation of information".

a) Mental activities based on data visualisation

The jurisprudence of the boards of appeal provides little support for the idea that screen representations inherently address technical problems (T.1143/06, T.95/86). A feature which relates to the manner in which cognitive content is conveyed to the user on a screen normally does not contribute to a technical solution to a technical problem. An exception would be if the manner of presentation can be shown to have a **credible technical effect** (T.1143/06, T.1575/07, T.1741/08 and T.1562/11). Features aimed exclusively at **improvements regarding the way information is perceived or processed** by the human mind are regarded as non-technical (see e.g. T.1567/05, T.125/04, T.579/11). A **GUI layout** (Graphical User Interface) as such is considered to be non-technical, being a "presentation of information" (Art. 52(2)(d) EPC; T.1741/08 citing T.1143/06). See also T.1214/09.

Features concerning the graphic design of user interfaces do not have a technical effect, because their design is not based on technical considerations, but on general intellectual considerations as to which design is particularly appealing to a user (Guidelines G-II, 3.7.1 – November 2018 version). For example, the colour (see T.1567/05, T.726/07, T.1734/11), shape (T.677/09), size (T.823/07, T.1237/07), layout (T.756/06, T.1741/08, T.1214/09), arrangement of items on the screen (T.643/00, T.1237/10) or the information content of a message displayed is usually not a technical aspect of a graphical user interface. An exception would be if these features contribute to achieving a particular technical effect (T.1741/08, T.1143/06).

A feature defining a presentation of information produces a technical effect if it credibly assists the user in performing a technical task by means of a continued and/or guided human-machine interaction process (T.336/14 and T.1802/13). Such a technical effect is considered credibly achieved if the assistance to the user in performing the technical task is objectively, reliably and causally linked to the feature. This would not be the case if the alleged effect depends on subjective interests or preferences of the user (Guidelines G-II, 3.7 – November 2018 version).

In T.1185/13 the board stated that graphical user interfaces generally do not contribute to a technical solution to a technical problem. An exception would be if the manner of presentation could be shown to have a credible technical effect i.e. if the GUI together with the content presented credibly assists the user in performing a technical task by means of a continued and/or guided human-machine interaction process.

In T.244/00 the board stated that the graphic design of menus was, as a rule, not a technical aspect of a menu-driven control system. Nor was the practical use of such menus

genuinely a problem with which the skilled person, in his function as a technical expert, was confronted. For the purpose of the problem and solution approach, the problem had to be a technical problem which the skilled person in the particular technical field might have been asked to solve at the priority date. The board therefore concluded that, in the case at issue, the technical problem had to be formulated in a more limited way than on the basis of the alleged advantages of moving a cursor diagonally over the TV screen (see T 154/04, OJ 2008, 46; T 125/04, T 1143/06).

In T 1237/10 the board pointed out that the displayed arrangement of images as defined by claim 1, including its temporal changes (a calendar-type layout), constituted a presentation of information, which is excluded "as such" from patentability under Art. 52(2)(d) EPC. Such a presentation of information contributes to inventive step only to the extent to which it interacts with the technical subject-matter of the claim for solving a technical problem (see T 154/04, OJ 2008, 46, and T 1214/09). The claimed presentation of images was aimed at showing the images to the user essentially for informational purposes and not, for example, at enabling a new mechanism for inputting an image selection.

The board considered that, in the context of the claimed invention, the idea of sequentially replacing the images shown in a display region by other images classified into the same time slot was not technical. Dealing with limited available space is part and parcel of the design of presentations of information for human viewing and is therefore per se not an indication of technicality (cf. decision T 1562/11). Although the issues of image size and resolution might play a role in the idea's implementation, the idea itself was independent of such issues. The objective technical problem solved by the claimed selection means was therefore that of implementing this idea. The board came to the conclusion that the skilled person would have trivially implemented it by providing suitable software "selection means" for sequentially replacing the images shown in each display region. The skilled person would hence have arrived at the subject-matter of claim 1 without the exercise of inventive activity. Thus the subject-matter of claim 1 lacked inventive step (Art. 52(1) and 56 EPC).

In T 643/00, the underlying GUI was configured, upon a user instruction, to simultaneously display hierarchically encoded image data in a side-by-side manner at a low resolution in order to make the search process easier for the user. Although human activities were involved in solving the problem, which activities might relate to the information contents of images looked for and might be motivated by personal interests and/or other non-technical preferences, the board considered that the claimed features relating to the format of images displayed were not presentations of information as such. The board noted that it was true that non-technical aspects may be found in the design and the use of an interface through which the user interacts with a system (see decision T 244/00). Indeed, presenting information through a user interface, if the only relevant effect of the presentation relates to the visually attractive nature of the graphic design or artwork, does not have technical character. However, in its decision the board had not excluded the possibility that an arrangement of menu items (or images) on a screen might be determined by technical considerations. Such considerations might be intended to enable the user to manage a technical task, such as **searching and retrieving images** stored in an image processing

apparatus, in a more efficient or faster manner, even if an evaluation by the user on a mental level was involved. Although such evaluation per se did not fall within the meaning of "invention" pursuant to Art. 52 EPC 1973, the **mere fact that mental activities were involved** did not necessarily qualify subject-matter as non-technical, since any technical solutions in the end were intended to provide tools which served, assisted or replaced human activities of different kinds, including mental ones. The board referred to T.1177/97 where it was stated that the use of a piece of information in a technical system, or its usability for this purpose, may confer a technical character on the information itself in that it reflects the properties of the technical system, for instance by being specifically formatted or processed. Additionally, the board referred to T.1194/97 where it was stated that **functional data** (line numbers, coded picture lines, addresses and synchronisations) recorded on a record carrier to be used in a picture retrieval system were to be distinguished from the **cognitive content** encoded. Even if the overall information could be interpreted in an infinite number of different ways in other technical or human contexts, this did not detract from its technical function in the relevant context of the claimed invention (see also T.424/03). Finally, the prior art lacked any clear hint of the claimed combination of image processing functions, so that the presence of inventive step as required by Art. 56 EPC had to be acknowledged.

In T.543/14 the board held that providing a visual indication of technical conditions of a machine is a technical feature, according to the case law of the boards of appeal (see T.528/07, T.781/10 and T.887/12).

In T.336/14 claim 1 of the invention was concerned with a user interface for an extracorporeal blood treatment machine. The board stated that in the assessment of inventive step of a claim which comprises technical and non-technical features ("mixed invention") and in which the non-technical features relate to cognitive content presented to the user of a graphical user interface (GUI), i.e. relate to "what" is presented rather than "how" something is presented, it has to be analysed whether the GUI together with the content presented credibly assists the user in performing a technical task (related to "why" that content is presented) by means of a continued and/or guided human-machine interaction process (see point 1.2.4 of the Reasons).

The board noted that it was immediately apparent that the information presented according to features of claim 1, i.e. the operating instructions and the corresponding pictographs, were **cognitive rather than functional data** in the sense of T.1194/97, since they directly address the user of the blood treatment machine and were consequently meaningful only to a human mind. Further, the distinguishing features were related to the content of the information, i.e. to "what" was presented, rather than to the manner in which the information was presented, i.e. to "how". Next, the question was whether the underlying user interface and the content presented credibly assisted the user in performing a technical task by means of a continued and guided human-machine interaction process. So, this question was basically related to "why" (i.e. "for what purpose") the content was presented. In other words, it had to be established whether the information presented constituted "technical information", which credibly enabled the user to properly operate the underlying technical system and thus had a technical effect, or rather "non-technical

information", which was exclusively aimed at the mental activities of the system user as the final addressee.

The board noted that not everything that supports a technical task has itself a technical character (cf. T.1741/08). Rather, the information of relevant features was evidently not related at all to any internal system state concerning the proper functioning of the underlying machine in the sense of T.115/85, let alone to a desirable or valid state within the meaning of T.362/90 or T.887/92. Thus, in accordance with T.1143/06, making reference to T.619/98, an action (possibly) performed by a user in response to a message concerning the technical functioning of an apparatus did not necessarily render technical the information conveyed (T.1143/06). The board came to the conclusion that the information provided according to the relevant features could not credibly support a **continued and guided human-machine interaction** process. Thus, it could not assist the user in performing the technical task. It only addressed the human mental process of an "average user", however the latter was supposed to be defined based on **personal skills and preferences** (see e.g. T.407/11). This had to be considered a non-technical effect.

In T.1802/13 the focal question was whether the distinguishing feature at issue had a technical effect or whether it related merely to presentations of information as such within the meaning of Art. 52(2), (d) and (3) EPC. In this context, the board noted that the superimposition of both the monitored data ("electrode leadwire") and the calculated data ("predicted volume of activation") on the patient's brain atlas was evidently concerned with "how" specific cognitive data was actually presented rather than "what" is presented. The board recalled T.1143/06 (see above), relied on by several boards and the Guidelines and stated that that similar to the issue of "what" was presented (see e.g. T.336/14), the main issue to be established – regarding the technicality of the manner in which (i.e. "how") information is presented – was whether the underlying user interface together with the manner in which cognitive content was presented credibly assisted the user in performing a technical task by means of a continued and guided human-machine interaction process (basically related to the question "for what purpose" the content is presented) (see for instance T.928/03).

The board noted, however, that feature i) corresponded to presenting cognitive content which addresses solely the user's mental process instead of credibly and causally assisting the user (surgeon) in performing the task of neurosurgical operations via a continued and/or guided human-machine interaction process. It is established jurisprudence of the boards of appeal that "lowering the cognitive burden of a user" per se cannot in principle be considered to be a technical effect (see e.g. T.1741/08, T.1539/09 and T.1237/10). Accordingly, the board held that feature i) related to presentations of information as such, i.e. to a non-technical feature, which has to be disregarded in the assessment of inventive step (see also T.1749/06).

In T.690/11 the invention concerned a dialysis system which comprised a display device, a web server and web browser operating with the display device to display information that could guide an operator through the setup procedure for performing a dialysis treatment and then illustrate the progress of that treatment. In the board's opinion, the claimed

features possessed more than mere information content directed exclusively to the human mind. The claimed display related to the interaction between the system and the operator and hence, implied technical means for the transmission and handling of respective signals contributing to the correct operation of the system. This conferred a technical character on the claimed features which had thus to be considered in the assessment of novelty and inventive step.

In T. 125/04 the board stated that, in general, the task of **designing diagrams** is non-technical. This is so even if the diagrams arguably convey information in way which a viewer may intuitively regard as particularly appealing, lucid or logical. In T. 125/04 the invention, like T. 643/00 above, also concerned an **arrangement of images** but was different in that only the information conveyed by the images, ie their "cognitive content" (see T. 1194/97, OJ 2000, 525), was relevant. The new features had to do with how this content was represented. Unlike T. 643/00, the invention provided no information about the computer system itself, such as the location where the data are stored. According to decision T. 641/00 (OJ 2003, 352), features of a claim making no contribution to the technical character of an invention cannot support the presence of an inventive step. Implementing the claimed steps by merely providing means for carrying out these steps is obvious. Accordingly, the board could not find that the steps performed by the features in claim 1 had any technical effects which went beyond those obtained by the normal use of a computer. It followed that the subject-matter of claim 1 lacked an inventive step.

In T. 49/04 the application related to a method and an apparatus for enhancing the presentation of a text in a natural language on a (computer) display. The board followed T. 643/00 rather than T. 125/04 and stated that technical aspects could not be ruled out in the design and use of a graphic interface. Furthermore, the presentation of natural language text on a display in a manner which improved readability, enabling users to perform their task more efficiently, related to how, i.e. by what physical **arrangement of the text**, cognitive content was conveyed to the reader and could thus be considered as contributing a technical solution to a technical problem. Therefore, the board concluded that the claimed features, viewed as a whole, did not relate to a non-invention listed in Art. 52(2) EPC 1973 as such.

In T. 1214/09 the appellant had argued that the **arrangement of thumbnail file** images defined by feature (i) contributed to improved evaluation of a large number of thumbnail file images by the user and thereby solved the problem of how to enable more efficient image retrieval. The appellant referred to decisions T. 49/04 and T. 1749/06. In decision T. 49/04, a particular way of dividing text segments based on linguistic considerations was considered to produce a technical effect in that it improved the readability of text on a display. The deciding board did not consider it relevant that the improvement in readability was essentially of a cognitive nature. In decision T. 1749/06, providing an icon with a three-dimensional appearance by modifying its edge with alternate dark and light stripes was found to be a technical effect. The deciding board was of the view that the test "happens in the brain of the viewer", which had been invoked by the examining division, was not useful for deciding whether a feature contributed to the technical character of a claim. The board recognised that both of these decisions could be understood as challenging the notion that **improving a human's cognitive evaluation** of certain information by

changing the manner in which the information is presented is non-technical. The board, however, noted that the alleged effect of feature (i), i.e. the improved evaluation of thumbnail file images by the user, was due solely to the claimed arrangement of thumbnail file images. In the board's judgment, this arrangement was not based on considerations other than those proper to the field of designing presentations of information for human viewing and is hence not an expression of any technical principle. The board therefore considered the alleged effect not to be a technical effect. The board held that, since in the context of this invention any **improvement** in the efficiency of image retrieval can only be the result of the non-technical improvement in the user's evaluation of the displayed thumbnail file images, feature (i) did not contribute to a technical solution of the problem of enabling more efficient image retrieval (see T 1143/06 and T 1741/08). The board therefore followed the approach taken in decision T 1143/06 and found that feature (i) at most contributed to the technical character of the invention through the details of its implementation (see for instance T 2045/10).

In T 1370/11 the board stated that the argument that a computer program or computer implemented method is inventive because it is faster than an earlier one is on its own insufficient to establish an inventive step. More specifically, the improved speed of a computer program is not by itself a technical contribution to the art (see also T 42/10). For a computer-implemented method or a computer program to be patentable it must be established that it has a "further" technical effect and solves a technical problem independently of its absolute or relative computing time. Only then, and only if the alleged speed-up affects an established technical effect, can it be argued that the speed-up contributes to a technical effect and thus to inventive step (T 641/00).

In T 651/12 the board stated that what were meant in Art. 52(2)(a) EPC were merely abstract mathematical methods, i.e. calculations for the sake of the calculation. However, in the case at issue, which was essentially the technical implementation in a map display apparatus of the method for displaying a bird's eye view map, the outcome of the calculation was used for a technical purpose, namely to **display information in an ergonomically improved manner**. The board further stated that also the calculation as such in that case had in the board's judgment clear technical aspects: the technical effect of reducing the need for data storage and enhancing the calculation speed, which were considered to provide a technical solution to a technical problem.

In T 1235/07 the invention used a tree diagram to view and navigate through the dimensions and levels of data in a multidimensional database. The board took a wider view of "presentation of information" than just the actual information that is displayed, the so-called cognitive content, to include also structural aspects of how the information is displayed. This broader meaning was supported by almost the only reference to the presentation of information in the travaux préparatoires. In the board's view, such additional aspects can only contribute to inventive step if they have technical character. The board noted that there was jurisprudence in this field holding that similar presentations of information are not technical. In particular, T 1143/06 concluded that representing, by the speed of an element moving on a display, the relevance of data in a database to sort statements had no technical effect. The case was similar in that the information was presented to the user in a way that made it easier to evaluate and the user could then

respond by selecting and displaying data. The board noted that the information was known per se, but only differed in the visual form in which it was displayed; i.e. speed of a moving element instead of in tables. In the board's view, the case before it was even less convincing because the invention was merely a visual display of a known analysis technique using known means, whereas in T. 1143/06 the idea of varying the speed of the element was at least not known. The board found that the solution was the implementation of user choices using known techniques that would be matters of routine design. Accordingly, the claimed invention did not involve an inventive step.

In T. 1741/08 the application was concerned with a method of entering data into a data processing system. The question was whether a technical effect could be attributed to a particular layout of a Graphical User Interface (GUI). It was undisputed that according to the established case law of the boards of appeal, the subject-matter of a claim cannot be inventive if there is no additional technical effect over and above any technical effects present in the closest prior art. The appellant argued that the required technical effect was to be seen in the reduction of computer resources resulting from the layout of icons which made it easier, particularly for an inexperienced user, to identify the stage reached in a process of data input requiring a number of steps and sub-steps. The board made clear that "lowering the cognitive burden of the user" is not of itself a technical effect (T. 1143/06 followed, T. 49/04 not followed). It found that the reduction in use of resources would be caused by the way the brain of the user perceives and processes the visual information given by a particular way of presenting information. The appellant also argued that there was a chain of effects. But in terms of technical effects this was a broken chain. The board did not accept that such a broken chain could be used as evidence of the required technical effect overall. Following T. 1143/06, the board considered a **GUI layout as such to be non-technical**, being a "presentation of information" (Art. 52(2)(d) EPC). In the case at issue, the **arrangement of icons** displayed was intended to convey information, namely at which step in the input process the user found him- or herself. The board stated that the mere fact that a particular **choice of information to display or of how to display** it is particularly clear, lucid, or "lowers the cognitive burden" of the user was not sufficient to demonstrate that the choice has a technical effect (see also T. 306/10). The case law of the boards of appeal was entirely consistent with this principle. The fact that not all GUI-related applications are considered to be inventive does not mean that there is a contradiction between the decisions. As to the one possible exception, T. 49/04, a single case deviating from the general case law was not a sufficient reason for a referral to the Enlarged Board of Appeal (see G. 3/08, OJ 2011, 10, point 10.12 of the Reasons). The cases T. 643/00, T. 928/03 and T. 333/95 which had been cited by the appellant were different from the case under consideration in that there was something other than the **simple choice** of what information to display and with what layout to display it, so that in these exceptional cases the displayed information might play a part in the assessment of inventive step of the claimed invention. The board made it clear that not everything that supports a technical task itself has a technical character.

T. 333/95 concerned using a computer to produce animations. In order to produce a scene in which a particular object moves, the selected object takes the place of the cursor, so that the user can move it around with the mouse as desired, while the system records the movements of the mouse and translates them into a script of commands for moving the

object in the later display of the animated scene. However, the board in that case clearly considered the feature of "making said graphics object the current cursor" as a technical feature per se. This "graphics object cursor" replaced the normal cursor (also technical) and its movements were recorded and translated into a kind of programming language. There was at least a technical effect in allowing the user to move the selected object around under control of the mouse. The decision did not say that every GUI design that makes user's inputting more efficient has a technical character (see T 1741/08).

In T 1073/06, the underlying GUI was configured, upon user input, to display objects of a **simulation model**, including graphical link representations to improve the ease of a user's comprehension of the model. The contribution of the claimed subject-matter to the prior art was related to the utilisation of association data stored in the memory to cause the link between the objects in the simulation model to be displayed with the associated graphical link representation. The deciding board held that "an improvement in the comprehension of a model is a purely mental effect, so that the problem solved was not seen as being technical. The claimed 'graphical link representations' related to the state of the simulation model, rather than to the state of the claimed simulation apparatus, and thus constituted presentations of information and are therefore also non-technical" (see T 336/14).

In decision T 489/14 (G 1/19) the following questions were referred to the Enlarged Board of Appeal for decision:

1. In the assessment of inventive step, can the computerimplemented simulation of a technical system or process solve a technical problem by producing a technical effect which goes beyond the simulation's implementation on a computer, if the computer-implemented simulation is claimed as such?
2. If the answer to the first question is yes, what are the relevant criteria for assessing whether a computer-implemented simulation claimed as such solves a technical problem? In particular, is it a sufficient condition that the simulation is based, at least in part, on technical principles underlying the simulated system or process?
3. What are the answers to the first and second questions if the computer-implemented simulation is claimed as part of a design process, in particular for verifying a design?

In T 1834/10 the contribution provided by the application had non-technical and technical aspects: a web page is made more attractive to potential customers by presenting images in a lively manner, and the images to be presented are selected and displayed automatically so that the presentation can be changed rapidly. The board noted that a web page designer may consider various approaches of selective content presentation as promising with respect to attracting customers' attention. However innovative an attractive content selection may be, it related to a presentation of information which was a priori non-technical (Art. 52(2)(d) EPC), even if it **lowers a user's cognitive burden** (T 1741/08) or prompts the user to start some technical action (**broken technical chain**, T 1741/08, T 1670/07). The desire to present a selection of images, to limit the selection to a predetermined number of images and to present the selected images in some **preferred layout** is a non-technical aim. The meaning of the display data does not convey any

technical character to the presentation. Effects resulting from an image presentation depend on the user's perception and/or constitute indirect technical effects and/or relate to administrative and economic aspects. The board noted that the only aspect that can enter into the examination for an inventive step is a technical implementation of the desired image presentation. However, program elements (tags, widgets) for transferring parameters from a markup language document to a page-generating program (e.g. browser) were well-known and were only used by the application in suit for their conventional purpose. The board had general doubts about whether a piece of software serving a non-technical purpose (presentation of information) can be considered as a technical implementation; such software rather constitutes a computer program as such (Art. 52(2)(c) EPC) as it fails to provide any further technical effect beyond the elementary interaction between software and hardware (T.1173/97, OJ 1999, 609). The combination of two types of non-inventions (presentation of information, computer program) is not enough to define a **technical contribution** (T.1755/10, "software implementation fallacy").

In T.677/09 the appellant argued that in the context of vehicle information systems and the user action of actuating the component, the information provided about differences between vehicles went beyond the mere provision of the information because it resulted in enhanced safety, which was technical. The board considered that such an effect would depend on the content of the information and the user's reaction to it. This effect was thus not the **direct effect of the feature** and could not be used to formulate the technical problem. The board noted that the appellant invoked non-technical aspects as a reason for not modifying the prior art and that in T.1670/07, this kind of argument was referred to as a "**non-technical prejudice fallacy**" (point 16 of the Reasons). The fact that this was not possible followed from the fact that the non-technical features relating to the information content could not contribute towards an inventive step at all. The question was not whether the skilled person would consider providing these features because that had already been decided in formulating the technical problem, but whether it would be obvious to implement the features in the claimed manner. The appellant pointed out that in data processing a signal generally has cognitive information content, but according to the jurisprudence nevertheless has technical character. However, the board considered that this technical character was due to the so called "functional data" implied by the signal, which inherently comprises technical features that interact with those of the system in which the signal is operating, such as synchronising data (see for example T.1194/97, point 3.3 of the Reasons). In the case at issue, there were no such inherent technical features of the difference information so that in the board's view it did not have a functional part, but remained purely cognitive.

The appellant considered that such an approach would rule out patents for all types of advanced driver assistance systems. The board did not share this concern as it is easy to imagine systems with features that might have a **direct technical effect**, such as giving information about the status of the engine, or about an imminent collision, or how to park the vehicle. The board noted that the information did not specifically relate to any technical condition of the vehicle, but simply differences between "features of a component", the effect of which depended on the information and covered any number of non-technical possibilities, such as the **colour** or the **shape** of the component. Accordingly the board held that the claim in question did not involve an inventive step.

In T.1567/05 the examining division argued that computing the largest stress value was obvious since this value would determine whether a building structural component was likely to fail or not, and the use of colours to represent ranges of values was well-known to the skilled person. In the board's view, however, there was no need to assess the degree of originality of these features since they have no technical effect. Art. 52(2) EPC includes "presentations of information" in the list of subject-matters that shall not be regarded as inventions. As was noted in decision T.154/04 (point 8 of the Reasons), this list covers subject-matters whose common feature is a substantial lack of technical character. That this is true for presentations of information was observed in decision T.119/88 (OJ 1990, 395), which states in point 4.2 of the Reasons that the classification of objects by colour represents a non-technical effect. Thus, the indication of "strength levels" in the form of predetermined display colours – which is a classification – has no technical effect and cannot contribute to an inventive step. Nor does the choice of information to be presented have a technical effect. Art. 52(2)(d) EPC does not distinguish between different kinds of information. Therefore the presentation (as such) of any information must be regarded as a "non-invention". It is thus irrelevant that the present invention is arranged to display the largest stress value for each building structural component (rather than some other stress value). Although relating to technical phenomena, the stress values are mere pieces of information aimed exclusively at the human mind. Further, the problem indicated in the description was not of a technical character because it depends on the skills and preferences of the particular group of users for whom the invention is intended (see also e.g. T.579/11).

In T.1734/11 the board stated that a reduction of user interaction does not necessarily convey technical character to the means for achieving the reduction (following T.1741/08). For example, a travel agent who acts as an intermediary between providers of travel services and a prospective traveller also has the effect of reducing the interaction between the end consumer and the providers of those services. The travel agent collects and processes information, and presents the results to the customer in a suitable form. This is, in the board's view, an administrative process which can be performed without technical means and without the need of technical skill. Inputting information to a machine and **reducing the burden of doing so**, while these may be technical tasks a priori (at least in the sense that they are not listed in Art. 52(2) EPC), not everything that supports a technical task has itself a technical character. On the other hand, presenting (i.e. outputting) information was deemed to be non-technical a priori (Art. 52(2)(d) EPC). However, in contrast to the presentation of the state of a technical machine, which may have technical character (T.115/85, OJ 1990, 30), the board considered that the presentation of pricing information, for example by **colour coding**, no matter how skilful that might be, is a non-technical aspect even if it helps the user to conduct a price-sensitive travel query more efficiently.

In T.726/07 the feature in question was the **use of a colour** to represent a state of the cache. The board stated that even assuming that this could be considered as representing "conditions prevailing in an apparatus" in the sense of T.115/85 (OJ 1990, 30), the board considered that the **use of a colour** was a common and obvious implementation of a status indication.

b) Display of data and user preferences

In T. 756/06 the board noted that the indication of internal states of a technical system, in the form of visual feedback for human interaction with the system, has been acknowledged to be technical by the boards in the past (see e.g. T. 115/85 (OJ 1990, 30; T. 362/90). This finding has been confirmed by more recent cases, in particular in T. 643/00, where the design of a GUI (Graphical user interface) was seen in the context of the technical process of fast and efficient image retrieval in an image processing apparatus. On the other hand, in cases where the GUI design aimed exclusively at the mental activities of a viewer, in particular at preparing the relevant data for a non-technical decision making process by the user as the final addressee, no technical contribution has been acknowledged beyond its mere implementation. For example, in T. 125/04, the vectorial presentation of information on the screen informing the customer about the properties of a product was aimed exclusively at the non-technical mental activity of selecting a desired product and making a purchasing decision. In the case before it, the board considered that the **layout** of the schedule was for the user's mental use, i.e. according to the **user's requirements and preferences**, rather than for a technical purpose in a technical process. Although the appellant mentioned the possibility of user input of the first time span, the board considered that this only resulted in a subjective **improvement** of the appearance of the schedule and was not a part of any technical process.

In T. 1841/06 the board stated that the aim and object of the invention was at best the result of balancing various **mental preferences of the user** but it was per se not a technical problem. Having the option of choosing between an original language and the preferred language might be felt as an inconvenience by one user but as an advantage by another. The invention brought about a mental simplification and subjective advantage for some users but it did not provide any objective advantage nor any technical advance in any field of technology. Such purely subjective preferences like any other non-technical aspects of an invention do not form a valid basis for a technical and inventive contribution over the prior art. Accordingly, the invention failed to meet the requirement of inventive step (see above T. 1958/13).

In T. 478/06 the claimed invention was a method of providing access to geographic information in a computer system. The board noted that, generally, any aspects that are based on the subjective interests, personal preferences and (business/commercial) activities or circumstances of the user are non-technical in nature. Thus the board agreed that managing, i.e. using depending on wishes, personal and geographical information was non-technical. Also, the choice of where to provide a control button was a matter of user preference, and/or the commercial circumstances such as which program was available to be modified. The same goes for the second aspect of prompting the user, when the map information was displayed, to indicate if directions were required. In the board's view this was technically no different from the basic function of offering directions, differing at most by a presentation of information in the form of a question, and by the point in time that the directions were offered, which was a matter of user preference, neither being a technical consideration. Finally, **the information content** itself was, of course, also non-technical and could not play a role in assessing inventive step (see also T. 1528/12). The board came to the conclusion that in the case before it, the choice of

where to put the control button was a purely non-technical consideration, such as the user's preferences, or the commercial circumstances of which program was available to be modified. It had no technical effect on the final outcome of displaying the map information, even if it did imply a particular technical implementation.

In T.115/85 (OJ 1990, 30) the board took the view that giving visual automatically about conditions prevailing in an apparatus or system was basically a technical problem.

In T.1000/09 the application addressed a need for a vehicle monitoring and reporting system that combined real-time vehicle performance data with **specific user preferences** for different types of data that could be captured by the system, such that a user could implement a maintenance plan that fitted their specific business plan for their vehicles. Data associated with the operation of a vehicle was gathered, processed to determine a probability of vehicle failure, and presented to the user. The board held that the failure probability information defined in claim 1 was only determined for presentation to the user, who could then decide to take technical action. The cognitive content of the presentation was not a technical feature, and it did not become technical even if it prompted the user to start a technical action (broken technical chain, T.1741/08, T.1670/07). The board also stated that setting user preferences for categories and ranges of data to be displayed in a convenient manner aims at a presentation of information, the latter being a priori non-technical (Art. 52(2)(d) EPC), even if it lowers a user's cognitive burden (T.1741/08). The cognitive meaning of the display data did not convey any technical character to the presentation. Effects resulting from a user-defined data presentation depended on the user's perception and/or constituted **indirect technical effects** and/or related to organisational and economic aspects. Regarding the technical, inputting side of the man-machine interface, the desire to provide it with inputting means for controlling the data output was driven by the obvious needs of users. The board judged that the system as defined in claim 1 did not involve any inventive step.

In T.862/10 the board referred to its case law (T.1143/06 and T.1741/08) and held that choosing the location of the display object in function of the urgency of the message was non-technical. In other words, the choice of where to put an object on a computer display depending on a value assigned to that object (its "urgency") could not be considered to have a further technical effect. Furthermore, the board also held that continuously moving the display object could serve no other objective purpose than that of presenting information as such. It therefore produced no further technical effect (i.e. no technical effect apart from the normal physical changes which inherently take place in a computer display) and did not contribute to the presence of an inventive step (see also T.1562/11). In contrast, feature (3) in claim 1 of the auxiliary request solved the objective problem of making it easier for the user to quickly locate the position of the display object on the display screen. In this context both the problem and the means to solve it were considered technical. They did not depend on psychological or other subjective factors but on technical parameters that can be precisely defined.

9.1.7 Assessment of features relating to meta methods for software production

Purely conceptual aspects of software design and development will normally not contribute to an inventive step according to the jurisprudence of the boards of appeal (T 983/10; see e.g. T 49/99, T 1171/06 and T 354/07).

In T 354/07 the application related to a process for producing software programs by means of a computer system. The board pointed out that software development and manufacture takes place in several stages from demand analysis through various design phases to production. All these stages essentially involve intellectual activity comparable to an engineer's design work, even if it is supported by programming tools and what is being designed is a technical system. While the design and programming of complex systems in particular require the active involvement of engineers and the application of technical knowledge, the eventual result to which each of these development phases is directly geared is not the technical solution of a technical problem but a requirements specification, a data, process and/or function model, or a program code. This assessment applies in particular to meta methods, which are concerned with the process of software production itself on an even more abstract level. For instance, they give the software developer instructions as to how the design process should be structured and organised or what modelling methods are to be used. These kinds of conceptual processes and meta methods for software production generally have no technical features relevant for patentability and thus cannot provide a basis for inventive step, unless, in an individual case, a direct causal connection can be proved with a technical effect which is relevant to the solution of a technical problem. No such technical effect could be ascertained in the case in question.

In T 42/10 and T 1281/10 claim 1 defined a method which, based on outcomes of games, calculated indications of the skills of the players by passing messages between nodes of a factor graph. The board had to determine to what extent the features of the claim had a technical character and could contribute to inventive step. The board referred to the decision of the Court of Appeal of England and Wales in *Re Gale's Application* [1991] RPC 305. The board's approach to assessing questions of what is and what is not technical about a computer-implemented method was, in this case, to ask the same questions as Nicholls LJ in *Re Gale's Application*. The first was what does the method as a whole do, and does it produce an overall technical result? The second was; if there is no overall technical result, does the method at least have a technical effect within the computer? If both questions were answered in the negative, no technical problem had been solved and there could be no inventive step. The board's view regarding technicality could be summarised as follows; the overall aim of keeping players interested is not technical. The intermediary aim of assessing and comparing playing performance is not technical. The representation of performance by probability distributions, and the updating of them, are mathematical methods. The use of factor graphs with message-passing is a matter of mathematics or abstract computer science. The board concluded that the only technical feature defined in this claim was the (computer) processor. The subject matter of claim 1, therefore, did not involve an inventive step if it would have been obvious to the skilled person, who had the task of implementing the method, to use a computer processor.

In T.1539/09 the invention related to a graphic programming language and environment that was designed to allow a user to write code without much training or expertise. The board took the view that reducing a programmer's intellectual effort was not a technical effect. This applied all the more since the effect was likewise sought for all programs developed, regardless of their purpose (see T.741/11). The board stated that the activity of programming – in the sense of writing code – is a mental act, at least to the extent that it is not used in an actual application or environment to produce a technical effect. Therefore the definition and provision of a programming language does not per se contribute to a technical solution, even if the selection of a programming language helps to reduce the programmer's intellectual effort (see also T.2270/10).

In T.1630/11 a method for simulating a multi-processor system in an electronic device was found to lack inventive step. The appellant had argued that the invention enabled users "to efficiently model and simulate a multi-processor system". The board noted that the major part of claim 1 was concerned with the expressions of a graphical programming environment which were found in T.1539/09 (point 5 of the Reasons) not to contribute to inventive step (see also T.2270/10, point 7 of the Reasons). The board followed its earlier jurisprudence according to which modifications to a programming language or system that enable the programmer to develop a program with greater ease and thus, presumably, speed and accuracy, do not make a technical contribution to the art.

9.1.8 Assessment of features relating to mathematical algorithms

Mathematical algorithms may contribute to the technical character of an invention only in so far as they serve a technical purpose (see e.g. T.1784/06, point 3.1.1 of the Reasons; T.1358/09, T.306/10, T.566/11, T.2035/11 and T.2249/13). In T.1784/06 the board stated that as the algorithm is a mathematical (inter alia Boolean) method and mathematical methods as such are deemed to be non-inventions (Art. 52(2) and (3) EPC), a technical character of the algorithm could be recognised only if it served a technical purpose (see e.g. T.1227/05, OJ 2007, 574).

At issue in T.625/11, was a method to establish at least one threshold value of a parameter for operating a nuclear reactor with a view to making better use of the reactor's capacity. The board found that establishing a threshold value for the first operating parameter lent the claim a technical dimension going beyond the mere interaction of the numerical-simulation algorithm and the computer system, the established parameter having a purpose closely linked to operating a nuclear reactor, regardless of whether or not it was actually used for that. The board thus acknowledged that the approach taken in T.1227/05 (OJ 2007, 574) was appropriate.

In T.1358/09 claim 1 defined a method for classifying text documents essentially in terms of an abstract mathematical algorithm. The board noted that a mathematical algorithm contributes to the technical character of a computer-implemented method only in so far as it serves a technical purpose (see T.1784/06). In the case in point, the algorithm served the general purpose of classifying text documents. The classification of text documents was certainly useful, as it could help to locate text documents with a relevant cognitive content, but in the board's view it did not qualify as a technical purpose. Whether two text

documents in respect of their textual content belong to the same "class" of documents was not a technical issue. The board noted that the same position was taken in decision T.1316/09, which held that methods of text classification per se did not produce a relevant technical effect or provide a technical solution to any technical problem. The board pointed out that not all efficiency aspects of an algorithm are by definition without relevance for the question of whether the algorithm provides a technical contribution. However, such technical considerations must go beyond merely finding a computer algorithm to carry out some procedure (see G.3/08, OJ 2011, 10; see also T.2418/12, T.22/12).

In T.2418/12 the board's stated, among other things, that the consideration that an intermediate result produced by an earlier algorithmic step may be re-used in a later step is an algorithmic rather than a technical consideration, as it does not require considerations about the internal functioning of a computer. This was in line with the case law of the boards of appeal, which generally holds that **algorithmic efficiency** is not a technical effect (cf. T.1784/06, T.42/10, T.1370/11).

In T.2035/11 the application mainly related to navigation systems that could be tailored to a user's particular wishes. The focus of the application was on the route-planning functionality of a navigation system. The board held that the subject-matter of claim 1 lacked an inventive step within the meaning of Art. 52(1) and Art. 56 EPC. Optimisation algorithms are mathematical methods, excluded "as such" from patentability under Art. 52(2) and (3) EPC. It noted that **mathematical algorithms may contribute to the technical character** of an invention only in so far as they serve a **technical purpose** (see e.g. decision T.1784/06). The purpose of the algorithm was the mere display of an optimal path to the user for cognitive processing. The user could act on the information, but did not need to. As stated in decision T.1670/07, a technical effect may arise from either the provision of data about a technical process, regardless of the presence of the user or its subsequent use, or from the provision of data (including data that on its own is excluded, e.g. produced by means of an algorithm) that is applied directly in a technical process. In the case at issue, the data was produced by means of an algorithm and was not applied directly in a technical process, so that neither possibility applied. The board's reasoning did not rely on a particular suggestion in the prior art, but on the finding that the proposed algorithmic change had no technical motivation and that its implementation was, uncontestedly, trivial. In so far as it was the appellant's view that technicality was irrelevant for the assessment of inventive step, this view was contrary to the established case law. The board noted that the German Federal Supreme Court had come to a similar conclusion in respect of a navigation system offering the user the possibility to exclude road segments based on a user-selectable property such as the road segment being a toll road (see BGH, 18 December 2012, X ZR 3/12, GRUR 2013, 275 – Routenplanung).

Methods of text classification per se did not produce a relevant technical effect or provide a technical solution to any technical problem (T.233/09, T.1316/09, and T.1358/09).

9.2. Combination invention

9.2.1 Existence of a combination invention

In assessing the inventive step involved in an invention based on a combination of features, consideration must be given to whether or not the state of the art was such as to suggest to a skilled person precisely the combination of features claimed. The fact that an individual feature or a number of features were known does not conclusively show the obviousness of a combination (T. 37/85, OJ 1988, 86; T. 656/93; T. 666/93; T. 1018/96). The question is not whether the skilled person, with access to the entire prior art, **could** have made the combination according to the invention, but whether he actually **would** have done so in expectation of an improvement (T. 2/83, OJ 1984, 265; T. 713/93; T. 223/94; T. 406/98). When assessing inventive step in a combination invention, the decisive criterion is not whether individual elements of the combination were known and obvious from prior art, but whether the state of the art would lead a skilled person to this particular overall combination of (possibly already known) features. Were this not so, it would be impossible for a combination consisting exclusively of known individual features to involve an inventive step (T. 388/89, T. 717/90, T. 869/96).

A mere aggregation of features must be distinguished from a combination invention.

The existence of a combination invention requires that the relationship between the features or groups of features be one of **functional reciprocity** or that they show a combinative effect beyond the sum of their individual effects. In T. 1054/05 the board stated that two features interact **synergistically** if their functions are interrelated and lead to an additional effect that goes beyond the sum of the effects of each feature taken in isolation. It is not enough that the features solve the same technical problem or that their effects are of the same kind and add up to an increased but otherwise unchanged effect (see also T. 926/11, in which it was found there was no synergistic effect between the feature groups). See also in this chapter I.D.9.2.2.

In T. 406/98 the board found that as a rule, particularly when large numbers of citations were involved, it was necessary to ask **why** the skilled person would consider documents in that specific combination, and whether, **not knowing the invention**, he had reason to do so. In this case, a complete solution to the problem required deliberate selection from a large number of citations.

In T. 55/93 the appellant's argument, according to which the alleged invention should have been regarded as a mere aggregation of solutions of two independent partial problems which were not interrelated, was not accepted by the board. In the case in point, not only could the primary problem underlying the contested patent neither be found nor be derived from the prior art documents, but also the claimed features complemented each other. The board stated that the features were functionally linked together, which was the actual characteristic of a combination invention. It was wrong to select, on the basis of a plurality of partial problems to be solved, the respective constructional means used in the apparatus combination, or the steps of the method worded in terms of functional features, which by working together provided a solution to the problem taken as a whole. The non-

obviousness of a combination claim turned on the simultaneous application of all its features (T 175/84, OJ 1989, 71). A combination effect was also acknowledged in T 120/88, T 731/94, T 434/95, T 897/95, T 1201/13.

9.2.2 Partial problems

In patent law terms, the existence of a combination of features, i.e. of a combination invention, is to be viewed differently from the mere existence of partial problems, i.e. of an aggregation of features. According to current case law, partial problems exist if the features or sets of features of a claim are a mere aggregation of these features or sets of features (juxtaposition or collocation) which are not **functionally interdependent**, i.e. do not mutually influence each other to achieve a technical success over and above the sum of their respective individual effects, in contrast to what is assumed in the case of a combination of features. What has to be established is whether each set of features is separately obvious in the light of the prior art (T 389/86, OJ 1988, 87; T 387/87; T 294/90; T 363/94; T 926/11; T 1587/14). It should also be borne in mind that solutions to partial problems in differing technical fields must be assessed on the basis of the knowledge and expertise of the person skilled in the art where the solution is found (T 32/81, OJ 1982, 225; T 324/94).

In T 389/86 (OJ 1988, 87) the relationship between the two groups of features was not one of functional reciprocity. The board ruled that in such circumstances no combinative effect could be advanced in support of inventive step; rather the question was whether each group, taken singly, was obviously derivable from the prior art. For the subject-matter of the claim to be inventive, it sufficed if one of these groups was (see also T 345/90, T 701/91, T 94/05, T 450/06, T 102/08, T 619/08, T 2097/10).

In T 1836/11, the patent concerned a two stage turbocharger for an internal combustion engine. The respondent (patent proprietor) argued that the backsweep and dual feed worm features could not be considered separately since they synergistically contributed to the stated aim of increasing efficiency. The board did not see any synergy between the two features. That the features both served the same overall purpose did not establish, in the board's view, a functional reciprocity between the two.

In T 130/89 (OJ 1991, 514) the technical problem intended to be solved by the claimed invention also consisted of two technically independent partial problems, each solved independently by one of the claimed subject-matter's features. The board held that the independence of the claimed subject-matter's features (each producing a different effect) meant that in assessing inventive step the two closest states of the art had to be considered to enable each of the two partial problems to be defined. It concluded that since each of the partial problems was solved by means which merely performed their known functions, each partial solution was obvious and the invention thus lacked inventiveness. In T 597/93 the board again saw no inventive step in combining the claim's two features – both known per se – since they related to the solving of two entirely separate partial problems. It cited T 687/94 which held that in such cases the solutions could be assessed separately against the prior art (see also T 315/88, T 65/90, T 2110/08).

In T. 711/96 the board found that characterising features (a) and (b) functioned completely independently of each other; there was no functional interplay (combination) between them. Although the setting for one value (e.g. spread) could indirectly affect that for the other (e.g. quantity), in that spread and quantity could both be adjusted upwards to maintain constant distribution, the two features were not directly related. In other words, the characterising features did not necessarily influence each other, although they could do. The board therefore assessed the inventive step of the two features separately, and concluded that both partial problems were obvious (see also T. 1585/07).

In T. 410/91 the board of appeal stated that no inventive step was involved since, although all the measures in claim 1 contributed to an increase in the efficiency of the plant, that contribution was based on known, different individual effects which resulted in these measures being executed in a manner expected by the skilled person. The subject-matter of claim 1 therefore involved the stringing-together of known measures which displayed their characteristic effects; no **synergistic** effect based on a combination of the individual measures was discernible in the sense of a mutual influence on their respective operation (see also T. 144/85, T. 141/87, T. 407/91, T. 1277/01).

In T. 204/06 the board recalled that the "could-would approach" involves asking whether the skilled person would have – as opposed to could have – taken a certain step towards the invention in expectation of some improvement or advantage (T. 2/83, OJ 1984, 265). This approach should not be taken to mean that inventions involving known design choices are non-obvious if only the number of choices is sufficiently great. It does imply, however, that if the skilled person expects some advantage of each feature in a claim and obtains no more than this advantage, then the claimed feature combination is obvious. It follows that any combination of features having known advantages (and disadvantages) is obvious unless it provides an unexpected effect (see also T. 2044/09).

9.3. Combination of teachings

In T. 1014/07 the examining division considered the subject-matter of claim 1 as obvious for the reason that each of the claimed features had been disclosed in the prior art. However, the board stated that the mere existence of teachings in the prior art is not a conclusive reason for explaining that the skilled person would have combined these teachings in order to solve the problem that he or she is confronted with. For the determination of the obviousness or non-obviousness of claimed subject-matter, it is not decisive that teachings are known – it must be decided whether or not the skilled person would have combined the known teachings such as to arrive at the claimed subject-matter when attempting to solve the underlying technical problem. Thus, the combination of known teachings may result in non-obvious subject-matter, namely when the skilled person is not motivated, for example by promptings in the prior art, to make such a combination. Under these circumstances the presence of any special effect arising from the combination is not necessary to establish an inventive step.

9.4. Technical disclosure in a prior art document

In line with the established case law of the boards of appeal, when investigating inventive step it should be borne in mind that the technical disclosure in a prior art document should be considered in its entirety, as it would be done by a person skilled in the art and that it is not justified arbitrarily to isolate parts of such document from their context in order to derive from them technical information which would be distinct from the integral teaching of the document (T 56/87, OJ 1990, 188; T 768/90; T 223/94; T 115/96; T 717/96; T 414/98). According to T 95/90, **different parts of text in a document** can be combined if there is nothing to stop the skilled person from doing so. Any ex post facto analysis of a document, i.e. any attempt to misinterpret the disclosure of the prior art so as to distort the proper technical teaching of the disclosure in order to arrive at the claimed subject-matter, should be avoided since this would conceal the real technical contribution of the invention (T 1967/08).

9.5. Features not contributing to the solution of the problem

According to the established case law of the boards of appeal, features which do not contribute to the solution of the problem set in the description are not to be considered in assessing the inventive step of a combination of features (T 37/82, OJ 1984, 71). According to this decision, in assessing the inventive step of a combination of features, consideration had to be given to a feature only if the applicant had provided evidence that it contributed, either independently or in conjunction with one or more of the other features, to the solution of the problem set in the description (see also T 65/87, T 144/90, T 206/91, T 226/94, T 912/94, T 15/97, T 471/98, T 442/02). Therefore, only those claimed features are to be considered which contribute causally to the solution of the problem (T 285/91). In T 294/89 the board stated that the additional feature provided no surprising advantage and did not make any contribution to solving the problem indicated. Hence, the said additional feature was not relevant for assessing the inventive step of the combination of features claimed.

In T 589/95 the terms of the solution of the technical problem extended into an area of use where it had been admitted that the relevant problem was known not to arise in practice. The board stated that, for such an area, the features of the solution did not contribute to the solution of the technical problem and could not be taken into account in the assessment of inventive step.

With reference to T 119/82, the Board 3.3.05 held in T 72/95, T 157/97, T 176/97 and T 158/97 that similar considerations applied to technically non-functional modifications. An inventive step could not be claimed on the basis of a non-functional modification of a known device. If a known device was modified by adding a feature which had no technical function, this modification could not be inventive (see also in this chapter I.D.9.1. "Treatment of technical and non-technical features").

In T 1009/12 the board took the view referring to T 206/91 that an ineffective concentration of a compound was considered as an arbitrary feature not contributing to the solution of the underlying problem and therefore not further considered. Since there were no further

distinguishing features it was not feasible to identify the technical problem to be solved and the claim lacked inventive step.

Even if there is no pointer or suggestion in the prior art towards the addition of a distinguishing feature, if said modification is not linked to a particular functionality, then it cannot per se constitute the basis for acknowledging an inventive step (T. 2044/09).

9.6. Substitution of materials – analogous use

According to T. 21/81 (OJ 1983, 15), it had to be regarded as forming part of his normal activities for a skilled person to select, from the materials known to him as suitable for a certain purpose, the one which was the most appropriate. The skilled person should therefore be at liberty, within the constraints of standard technical progress, to use alternative means known by him to have the same effect (T. 324/94). In T. 410/92 the board also held that using higher-quality materials in the design of single-phase synchronous motors with a double-pole permanent-magnet rotor was obvious. The appellants had argued that the skilled person using the superior materials available to him would be confronted with baffling starting problems. The board however concluded that the skilled person's encountering known problems when using newly developed materials would not deter him from using them in order to achieve specific, desired improvements, particularly since the means of overcoming such problems could be derived from the prior art.

The Headnote in T. 192/82 (OJ 1984, 415) read as follows: If an article is known as a combination or mixture of components fulfilling known functions, the generation and application of an improved novel component for the same purpose may be patentable as such and also as an improved article incorporating the same. If the component in question forms, on the other hand, part of the state of the art together with its relevant properties, the incorporation thereof in the same article will be obvious in view of its predictable beneficial effect ("analogous substitution").

In this connection the board also established in T. 130/89 (OJ 1991, 514) that the use of a known material on the basis of its known properties and in a known manner to obtain a known effect in a new combination was not normally inventive ("similar use"). Exceptions to this principle might be allowed in special cases, e.g. where a selection brought unexpected advantages, a known prejudice was overcome or unforeseen difficulties were encountered, such as the need to alter another component (see also T. 1216/05, T. 330/07, T. 422/09).

Following these decisions, the board summarised as follows in T. 213/87: in the absence of any unexpected effect, the mere substitution of an element by another known for its relevant properties to provide that known effect could not be regarded as patentable.

9.7. Combination of documents

It would not be obvious to a skilled person to combine an isolated, very old document (i.e. 50 year old document), which had not given rise to a trend in the art and whose teaching

ran counter to the present trend, with the document reflecting the closest state of the art (T. 261/87, T. 366/89, T. 404/90).

In T. 278/14 the board rejected the argument that the need to combine three pieces of prior art in order to arrive at the claimed process confirmed the presence of an inventive step. The board held that there was no general principle which determines that in order for a lack of inventive step to be established only two documents may be combined.

In T. 745/92 the board pointed out that the disclosure of two prior documents – even if they were classified under the same IPC classification – could only be combined so as to result in a finding of lack of inventive step if such combination would have been obvious to a skilled person seeking to solve the problem underlying the claimed invention (T. 104/95, T. 395/00).

In T. 715/09 the respondent submitted that the skilled person versed in the art of glow plugs would not, as part of his common knowledge, be aware of plasma deposition technology. Support for this submission was that glow plugs and surface treatment techniques were in two completely different classes according to the international patent classification scheme. The board disagreed and stated that IPC classification alone was no reason for determining whether or not two pieces of prior art could be combined. The mere fact that two documents had the same classification was no reason for saying the combination of the teachings was obvious (T. 745/92). Likewise the mere fact that the technologies had been given different IPC classes did not necessarily mean that they could not be combined.

In T. 454/13 the invention concerned a sample block apparatus and a method for maintaining a microcard on a sample block. The problem to be solved consisted in improving temperature uniformity between the plurality of samples on a single microcard. According to appellant 2 (opponent), the solution was obvious in view of a combination of document D1 with any of documents D6 to D8. Concerning D6 to D8, the board observed that they were from a technical field remote from the field of biological testing, i.e. these documents all concerned the manufacturing of semiconductor devices and therefore could not give any hint as to how to solve the problem of improving temperature uniformity between a plurality of samples of biological material located on a microcard. As the issue of biological samples was not normally encountered in the field of semiconductor manufacturing, the skilled person would have no incentive to look for a solution in that field. The board concluded that the skilled person would have been dissuaded from consulting documents D6 to D8.

In T. 552/89 the board confirmed that, when assessing inventive step, it was not permissible to combine the teachings of different documents within the state of the art in order to establish the obviousness of a claimed invention, unless it would have been obvious for the skilled person to do so at the time of filing. When a problem defined by reference to the closest prior art as disclosed in a primary document consisted of individual problems, board of appeal case law stated that the skilled person could be expected to take account of solutions to the individual problems proposed in different secondary documents in the same or neighbouring technical fields. Thus, the teachings of secondary

documents might be combined with the disclosure of the closest prior art if such secondary documents provided solutions to specific individual problems forming part of the objective problem in progressing from the closest prior art, in particular when such individual solutions were merely aggregated together in the claimed invention (see also T.302/02, T.881/09).

In T.302/02 the board added that, if an invention consisted of a new combination of features taken from different technical areas, a discussion whether or not it was obvious would normally involve at least as many documents as technical areas combined in it. The board adopted the approach taken in T.552/89, according to which a technical problem might be formed of "individual problems". The number of individual problems obviously depended on the degree of detail of the claim under consideration and the cited decision did not suggest that beyond a certain number the presence of an inventive step might be taken for granted. On the contrary, it was said to be obvious to try to solve the individual problems as long as the corresponding solutions were "merely aggregated together" in the claim.

In T.881/09 the board stated that since the teachings of both documents stood in heavy discrepancy to each other, in view of their incompatibilities a combination of these documents was not obvious (T.552/89) but rather artificial and could only be the result of an ex post facto analysis.

9.8. Chemical inventions

9.8.1 Problem and solution approach in chemical inventions

In a number of chemistry decisions the problem and solution approach – based on landmark decisions T.1/80 (OJ 1981, 206), T.24/81 (OJ 1983, 133) and T.248/85 (OJ 1986, 261) – involves the following steps:

- a) establishing the closest prior art;
- b) defining the problem in the light of that prior art;
- c) identifying the solution;
- d) demonstrating the success of the solution;
- e) optionally reformulating the problem;
- f) examining the obviousness of the solution in view of the state of the art.

Demonstrating the success of the solution and reformulating the problem are particularly important steps (see T.231/97, T.355/97).

9.8.2 Structural similarity

To deny inventive step for novel chemical compounds because of their structural similarity to known chemical compounds amounted to an allegation that a skilled person would have reasonably expected the same or similar usefulness of both the known and the novel compounds as the means for solving the technical problem underlying the application in question. Such an expectation would be justified, if the skilled person knew, be it from

common general knowledge or from some specific disclosure, that the existing structural differences of the chemical compounds concerned were so small that they would have no essential bearing on those properties, which were important for solving the said technical problem and could be disregarded (T. 852/91, see also T. 358/04).

In T. 643/96 the board held that the concept of bioisosterism did form part of the common general knowledge of those skilled in the art, but that it had to be applied with caution when deciding upon inventive step. In the field of drug design, any structural modification of a pharmacologically active compound was, in the absence of an established correlation between structural features and activity, expected a priori to disturb the pharmacological activity profile of the initial structure. This also held true for an alleged case of bioisosterism, which was one option of a structure-activity relationship, as long as it was not an established case of bioisosterism (see also T. 548/91). In T. 643/96 it was held that, when deciding upon inventive step in relation to pharmacologically active compounds, what was essential was not whether a particular substructure of a chemical compound was replaced by another known isosteric one, but whether information was available on the impact of such a replacement on the pharmacological activity profile of the specific (group of) compound(s) concerned (see also T. 467/94, T. 156/95).

In T. 2402/10 the board stated that in the field of drug design any structural modification of a pharmacologically active compound is, in the absence of an established correlation between structural features and activity, a priori expected to disturb the pharmacological activity profile of the initial structure (see T. 643/96, T. 548/91).

In T. 930/94 the board held that knowledge of the fact that one specific member of a class of chemical compounds did not lead to the effect achieved by several other members of this class, did not, without additional indications, mean that such an effect could be attributed to all the compounds in this group. In such circumstances, the effect in point did not lead to a recognition of the existence of a technical concept that could be generalised (T. 641/97, T. 209/98, T. 853/03).

In T. 989/93 the board stated that, in the absence of the appropriate common general knowledge, no conclusions are possible on the basis of the known properties of one group of chemical compounds (here: benzene derivatives) regarding the properties of a different group of chemical compounds (here: naphthalene derivatives).

9.8.3 Broad claims

Art. 56 EPC 1973 requires the claimed invention, i.e. the proposed technical solution for a given technical problem, not to be obvious to a skilled person from the state of the art. If the inventive step of a claimed invention is based on a given technical effect, the latter should, in principle, be achievable over the whole area claimed (T. 939/92, OJ 1996, 309; T. 694/92, OJ 1997, 408; T. 583/93, OJ 1996, 496). Art. 69 EPC and its Protocol do not provide a basis for excluding from a claim embodiments that fall under its literal wording (T. 1296/13 citing T. 223/05).

T.939/92 (OJ 1996, 309) contained fundamental rulings on broad claims in the field of chemistry. The board held that in view of the state of the art the technical problem which the patent in suit addressed was the provision of further chemical compounds with herbicidal activity. It was necessary for all the claimed compounds to possess this activity. Moreover, the question as to whether or not such a technical effect was achieved by all the chemical compounds covered by such a claim, might properly arise under Art. 56 EPC 1973, if this technical effect turned out to be the sole reason for the alleged inventiveness of these compounds. The appellants' submission that the test results contained in the description showed that **some** of the claimed compounds were indeed herbicidally active could not be regarded as sufficient evidence to lead to the inference that substantially **all** the claimed compounds possessed this activity. In such a case the burden of proof rested with the appellants. The requirements of Art. 56 EPC 1973 had not therefore been met (**T.268/00**, **T.1188/00**, **T.320/01**, **T.1064/01**, **T.924/02**).

Following **T.939/92** (OJ 1996, 309), the board stated in **T.668/94** that the technical problem could only be taken into account in the assessment of inventive step if it could be accepted as having been successfully solved, i.e. if it were credible that substantially all the claimed compounds possessed the plant growth regulating activity. When only some and not substantially all claimed compounds exhibited a particular technical effect, the conclusion had to be that the invention as broadly defined in the independent claim was not a solution to the technical problem of achieving the given technical effect, with the consequence that the alleged technical effect of some of the claimed compounds was to be disregarded when determining the objective problem underlying the invention and thus when assessing inventive step.

In **T.942/98** the problem as per the application was the preparation of improved selective herbicides. The board referred to the above-mentioned case law and did not agree with the applicant that, in the case in hand, he merely had to show an improved effect at the direct interface between prior art and the application in order to demonstrate, without providing further details, that such an improvement applied without qualification for the entire breadth of the claim. The appellant's position, in the board's view, amounted to allowing the applicant to decide how broad a claim could be, whether or not an improvement in the effect of all the compounds claimed was actually credible.

9.8.4 Intermediate products

In decision **T.22/82** (OJ 1982, 341) the board ruled that the preparation of new intermediates for a surprisingly advantageous complete process for the preparation of known and desired end products was inventive.

Again in **T.163/84** (OJ 1987, 301) intermediate chemical products were held to be patentable on the grounds that their further processing to the known end products involved an inventive step. The board however held that a new chemical intermediate did not become inventive merely because it was prepared in the course of an inventive multi-stage process and was further processed to a known end-product; there had to be other factors as well, such as that the process for preparing the new intermediate had enabled it to be

prepared for the first time and had done so inventively and other methods of preparing it had appeared to be ruled out.

In T. 648/88 (OJ 1991, 292) the board disagreed with the view expressed in T. 163/84, pursuing instead the line taken in T. 22/82. An intermediate intended for the preparation of a known end-product was deemed to be inventive if its preparation took place in connection with inventive preparation or inventive further processing or in the course of an inventive complete process (confirmed in T. 1239/01).

In T. 65/82 (OJ 1983, 327) it was explained that new intermediates which take part in (non-inventive) analogy processes for sequent products (i.e. end products or intermediates of various kinds), must – in order to qualify as intermediates – provide a structural contribution to the subsequent products. Even where this condition is met, such intermediates are not thereby unconditionally inventive, i.e. not without taking the state of the art into consideration. As state of the art in relation to intermediates there are two different areas to be taken into account. One is the "close-to-the-intermediate" state of the art. These are all compounds identified from their chemical composition as lying close to the intermediates. On the other hand the "close-to-the-product" state of the art must also be taken into account, i.e. those compounds identified from their chemical composition as lying close to the subsequent products.

In T. 18/88 (OJ 1992, 107) the applicants had argued that the insecticidal activity of the known end products was significantly superior to that of another known insecticide with a similar structure; this was sufficient to establish an inventive step for the intermediate products, even if the end products were not novel and/or inventive. The board, referring to T. 65/82 (OJ 1983, 327), rejected the applicants' argument on the following grounds: claimed intermediates must themselves be based on an inventive step to be patentable. Whether, under certain circumstances, new and inventive subsequent products might support an inventive step of intermediates was not the question here, because the subsequent products in this case were either not novel or not inventive. The superior effect of subsequent products which were neither novel nor inventive was not sufficient to render the intermediates inventive (T. 697/96, T. 51/98).

9.8.5 Predictable improvements resulting from amorphous forms as compared to crystalline forms

In T. 777/08 (OJ 2011, 633) the claims in question related to a particular polymorph (form IV) of crystalline atorvastatin hydrate. The board considered that the amorphous form of atorvastatin, as obtained according to the processes of documents (1) and (2) represented the closest state of the art. The appellant defined the problem to be solved in view of this prior art as lying in the provision of atorvastatin in a form having improved filterability and drying characteristics. Having regard to the experimental results reported in document (25), which demonstrated shorter filtration and drying times for form IV compared to the amorphous form, the board was satisfied that this problem had been solved. It also found that the skilled person in the field of pharmaceutical drug development would have been aware of the fact that instances of polymorphism were commonplace in molecules of interest to the pharmaceutical industry, and have known it to be advisable to screen for

polymorphs early on in the drug development process. Moreover, he would be familiar with routine methods of screening. Consequently, in the absence of any technical prejudice and in the absence of any unexpected property, the mere provision of a crystalline form of a known pharmaceutically active compound could not be regarded as involving an inventive step.

9.8.6 Synergistic effects

In T.1814/11 the problem to be solved was to provide an alternative synergistically active fungicidal composition based on prothioconazole. The board concluded that synergistic effects were not foreseeable, i.e. even if a combination of two specific compositions had a synergistic effect as in document 1, such synergy could not necessarily be expected if the structure of one of the two compositions were modified. **Synergy** was not in principle foreseeable and therefore could not be attributed to a specific mechanism of action and/or structure. The board dismissed the respondent's suggestion of **trial-and-error** experimentation as inappropriate in this case.

9.9. Equivalents

According to established board of appeal case law, equivalents which are not disclosed in a published document must not be considered in assessing novelty, as this properly belongs to the examination for inventive step (see T.167/84, OJ 1987, 369; T.446/88; T.517/90; see also Guidelines G-VI, 2 – November 2018 version). In T.697/92 the board dealt with the concept of "equivalent means", according to which two means were equivalent if, despite having different embodiments, they fulfilled the same function with regard to the same result. Both means performed the same function if they shared the same basic idea, i.e. if they applied the same principle in the same way. The result was the totality of the technical effects produced by the means. In order to be considered as equivalents, the means had to achieve the same kind and quality of result. A means was thus not equivalent if, because of its different embodiment, it led to a result of the same kind but of a different quality or degree of effectiveness. The result did not necessarily even have to be better; it was sufficient for it to be different, since it was not the result itself which was patentable but the means by which it was achieved (see also T.818/93, T.929/02).

9.10. Selection inventions

In T.2623/11 the board stated that for selection inventions, only if the selection is connected to a particular technical effect, and if no hints exist which lead the skilled person to the selection, may an inventive step be accepted. In the case in hand, there was no support in the application for the claimed selection being connected to any particular technical effect. Moreover, hints existed in the state of the art which led the skilled person to the selection.

9.11. Problem inventions

The discovery of an unrecognised problem may in certain circumstances give rise to patentable subject-matter in spite of the fact that the claimed solution is retrospectively trivial and in itself obvious (see T 2/83, OJ 1984, 265; T 225/84). The posing of a new problem did not represent a contribution to the inventive merits of the solution if it could have been posed by the average person skilled in the art (T 109/82, OJ 1984, 473). It also had to be taken into consideration that it was the normal task of the skilled person to be constantly occupied with the elimination of deficiencies, the overcoming of drawbacks and the achievement of improvements of known devices and/or products (see T 15/81, OJ 1982, 2; T 195/84, OJ 1986, 121). In T 532/88 the board confirmed the established principle that to address a problem simply by looking for ways of overcoming difficulties arising in the course of routine work did not constitute inventiveness. Following this case law, the boards held in T 630/92, T 798/92, T 578/92, T 610/95, T 805/97, T 1417/05 and T 2303/11 that the posing of the problem could not confer any inventive merit on the claimed subject-matter. Inventive step was however acknowledged in T 135/94, T 540/93 (pet doors), T 1236/03, T 764/12, T 1201/13 and T 2321/15 on the ground (also) that the posing of the problem was not obvious.

The absence of a hint in the prior art that there might still be a desire for further improvement does not mean that an unrecognised problem has been discovered (T 252/10).

In T 971/92 the board emphasised that the appreciation of conventional technical problems which formed the basis of the normal activities of the notional person skilled in the art, such as the removal of shortcomings, the optimisation of parameters or the saving of energy or time, could not involve an inventive step. The appreciation of a technical problem could thus only contribute to the inventive step in very exceptional circumstances. However, if an applicant nevertheless wished to rely on an assertion that the inventive activity resided in the recognition of a technical problem to which the solution was admittedly obvious, then the minimum requirement to be met was that this technical problem be clearly and unambiguously disclosed in the application as filed (T 43/97, T 1417/05).

In T 566/91 the invention related to a soft nystatin pastille formulation for treatment of candidiasis in the oral cavity. In the case in point the board did not agree with the submission by the appellants that the technical problem underlying the contested patent consisted in the unrecognised problem of poor patient compliance, as the average skilled person could have posed that problem where – as in that particular case – one necessarily came to light when an object or product was used. Consequently, a problem which amounted to no more than noticing obvious non-compliance with an obvious desideratum in a given situation, namely poor patient compliance using nystatin formulation as a result of the unpleasant taste of the active substance, could not be retained as the actual problem to be solved.

In T 764/12 the technical contribution of the patent in suit resided in identifying a problem which was hitherto not recognised in the prior art, namely the need for protection during

storage at ambient environmental conditions of a chewing gum base comprising environmentally degradable polymers. The arguments of the opponent that the claimed invention lacked inventive step because coating was well known to reduce degradation over time were not relevant. Referring to T. 2/83 (OJ 1984, 265) the board acknowledged an inventive step because the perception of the problem had to be considered as being the main contribution to the inventive merits of the solution claimed.

9.12. New use of a known measure

When determining inventive step in the case of a new use of a known measure, the boards of appeal examine whether or not the problem which has been solved with a known measure in a known case differs from the problem posed in the case to be decided. If this examination reveals that there is no fundamental difference between the two problems, it can in principle be concluded that there is no inventive step if the known measure is adopted (see in particular T. 39/82, OJ 1982, 419; T. 142/84, OJ 1987, 112; T. 332/90; T. 485/91; T. 25/97). In T. 39/82 (OJ 1982, 419) the board stated that it could not be considered obvious for the skilled person to use a known measure in a different context since the problems differed fundamentally from one another.

Referring to T. 39/82 (OJ 1982, 419) the board confirmed in T. 818/93 that in a **combination invention** all the features might be known per se – the invention resided in the way the features were interrelated, both structurally and functionally. In assessing the inventive step of the combination in question it was therefore of no consequence that a suitable structure was already known, provided its use and application in the conditions, and circumstances disclosed in the patent were not suggested by the cited prior art.

In T. 741/92 the invention involved the new use of a known means, namely a particular mesh structure. In the case of such inventions the board took the view that it was of little importance that the means was known per se if new properties and purposes came into play in its use. The known means was used in the invention to obtain a result not previously known or obvious.

Summing up in T. 301/90, the board held that it was a generally accepted principle in the assessment of inventive step that, whereas the use of a known measure to achieve a known result on the basis of the expected inherent effect was not normally inventive, the indication of a new and non-obvious technical result, which could be achieved through these known effects (for application to the field of chemistry, see T. 4/83, OJ 1983, 498 and to the field of physics, see T. 39/82, OJ 1982, 419) might nevertheless convert the use of this known measure into a new and non-obvious tool for solving a new technical problem. It might thus represent an enrichment of the art and imply an inventive step (see T. 1096/92, T. 238/93).

In T. 590/90 the respondents argued that both the measures taken that distinguished the technical teaching of the contested patent from that of document 1 were already part of the prior art, and their application to the process described in document 1 was obvious. However, the board held that the application of a measure known as such, contrary to warnings given in several documents, was not obvious. Since this measure involved an

inventive step, the overall process of claim 1 encompassing that measure likewise involved an inventive step: the modification of a known process by two measures, at least one of which was not obvious, rendered the entire process inventive.

9.13. Obvious new use

In T 112/92 (OJ 1994, 192) document (1), as the closest prior art, referred to the use of glucomannan as a thickener for an ungelled processed food product, but did not mention its function as a stabiliser. The board applied the principles set out in T 59/87 (OJ 1991, 561) to the case in hand and stated that even if glucomannan did act as an emulsion stabiliser in preparing the product in accordance with document (1), this use would have been a hidden use. It came to the conclusion that the use of a substance as a stabiliser for emulsions, if not inextricably linked with its use as a thickening agent, was at least very closely related. The board held that it would have been obvious for the skilled person, knowing that glucomannan was effective as a thickening agent for emulsions, at least to try to find out if it was also effective as a stabiliser. Although T 59/87 had found that a claim to an inherent but hidden later use of a known substance could be novel, the subject-matter of such a claim would still lack inventive step if the prior art indicated a well-established link between the earlier and later uses (see also T 544/94).

9.14. Need to improve properties

In its Headnote to T 57/84 (OJ 1987, 53) the board stated: if a product is required to manifest a particular property (in this case a highly fungicidal effect) under various conditions, the superiority of the invention will depend on whether or not that property is improved under all conditions liable to be encountered in practice and particularly under the various conditions evolved in order to test it (in this case exposure to water and wind). If comparative tests are cited in support of that superiority, it is their combined results that have to be considered. The decisive factor is whether the invention outperforms the substance used for comparison in the tests as a whole (in this case, results in the need to use a significantly lower concentration of the pollutant substance), even if the substance used for comparison proves better in one of the tests.

Following T 57/84, it was stated in T 254/86 (OJ 1989, 115) that an invention which relied on a substantial and surprising improvement of a particular property did not also need to show advantages over the prior art with regard to other properties relevant to its use, provided the latter were maintained at a reasonable level so that the improvement was not completely offset by disadvantages in other respects to an unacceptable degree or in a manner which contradicted the disclosure of the invention fundamentally (see also T 155/85, OJ 1988, 87). It was thus not necessary for there to be an improvement in every respect (T 302/87, T 470/90).

In T 155/85 (OJ 1988, 87) it was further pointed out that subject-matter falling structurally between two particular embodiments of cited disclosure and displaying, in all relevant respects, effects substantially between those known for the same embodiments, lacked inventive step in the absence of other considerations.

9.15. Disclaimer

For information on disclaimers, see in particular chapter II.E.1.7. "Disclaimers".

9.16. Optimisation of parameters

In key decision T 36/82 (OJ 1983, 269), the board stated that inventive step was not considered to be constituted by efforts directed at the concurrent optimisation of two parameters of a particular device by the simultaneous solution of two equations which were known per se and respectively expressed those parameters as functions of certain dimensions of the device. The fact that it had proved possible to find a range of values for the dimensions in question which provided an acceptable compromise between the two parameters could not be considered surprising where there were indications in the prior art suggesting that favourable results might be obtained by the method of calculation applied.

In T 263/86 the invention related to a spectacle lens with an astigmatic effect. The board pointed out that the relationship between residual astigmatism, focussing error and frequency response could be assumed to be known by a spectacles expert. The board therefore saw the quality formula as merely the result of simultaneous optimisation of a number of lens properties which led to a compromise lying within the skilled person's discretion. However, such compromises in the case of a parameter optimisation were not deemed to be surprising and their discovery was thus not considered to involve an inventive step.

In a number of other decisions, all of which referred to T 36/82 (OJ 1983, 269) the subject-matter was found not to involve an inventive step, particularly when the problem addressed was to find a suitable compromise between different parameters (T 38/87, T 54/87, T 655/93, T 118/94). In T 410/87 the board stated that it was part of the activities deemed normal for the skilled person to optimise a physical dimension in such a way as to reach an acceptable compromise, serving the intended purpose, between two effects which were contingent in opposing ways on this dimension (see also T 409/90, OJ 1993, 40; T 660/91; T 218/96; T 395/96; T 660/00).

In T 73/85 the board stated that the very fact that the problem of improving the property in question was solved not – as was normal – by means of a specific change in structural parameters, but by amending process parameters, had in fact to be considered surprising. In this case it did not matter that the individual reaction conditions claimed in the disputed patent were known per se; more important was whether the skilled person, in expectation of the sought-after optimisation had suggested, or – in the absence of possible predictions – had tried as a matter of priority, the combination of measures known per se claimed.

In T 500/89 the board established that the fact that individual parameter areas taken per se were known did not imply that it was obvious to combine them specifically to solve the problem according to the contested patent. The combination of the individual parameter areas was not the result of merely routine optimisation of the process according to document 1, as there was nothing in said document to suggest this combination.

9.17. Small improvement in commercially used process

In T 38/84 (OJ 1984, 368) the board of appeal pointed out that the achievement of a numerically small improvement in a process commercially used on a large scale (here enhanced yield of 0.5%) represented a worthwhile technical problem which should not be disregarded in assessing the inventive step of its solution as claimed (see also T 466/88, T 332/90). In T 155/85 (OJ 1988, 87) the board added that it was correct to say that even small improvements in yield or other industrial characteristics could mean a very relevant improvement in large-scale production, but the improvement had to be significant and therefore above margins of error and normal fluctuations in the field in consequence of other parameters. In T 286/93 the invention related to a process for manufacturing wrapping paper and board. The results for the process had shown that the machine speed and the mechanical quality of the paper obtained had improved by some 3 % vis-à-vis a process in which the order in which aluminium polychloride and cationic starch were added had been reversed. Since a process of this kind was obviously intended for the production of paper on an industrial scale, even a small improvement had to be regarded as significant.

9.18. Analogy process – envisageable product

The effect of a process manifests itself in the result, i.e. in the product in chemical cases, together with its internal characteristics and the consequences of its history of origin, e.g. quality, yield and economic value. It is well-established that analogy processes are patentable insofar as they provide a novel and inventive product. This is because all the features of the analogy process can only be derived from an effect which is as yet unknown and unsuspected (problem invention). If, on the other hand, the effect is wholly or partially known, e.g. the product is old or is a novel modification of an old structural part, the invention, i.e. the process or the intermediate therefore, should not merely consist of features which are already necessarily and readily derivable from the known part of the effect in an obvious manner having regard to the state of the art (T 119/82, OJ 1984, 217; see also T 65/82, OJ 1983, 327).

According to T 2/83 (OJ 1984, 265), so-called analogy processes in chemistry are only claimable if the problem, i.e. the need to produce certain patentable products as their effect, is not yet within the state of the art.

In T 1131/05 the board deemed a process claim directed to an analogy process to be new and inventive.

T 595/90 (OJ 1994, 695) was concerned with the inventiveness of a product which could be envisaged as such but for which no known method of manufacture existed. Accordingly, a product which could be envisaged as such with all characteristics determining its identity including its properties in use, i.e. an otherwise obvious entity, might nevertheless become non-obvious and claimable as such, if there was no known way or applicable (analogous) method in the art for making it and the claimed methods for its preparation were therefore the first to achieve this and do so in an inventive manner (T 268/98, T 441/02, T 1175/14).

In T 803/01 the board concluded that by analogy with T 595/90, the decisive question in the case in point was whether the polylactide in the claimed degree of purity was achievable at the priority date of the application in suit or whether there was an obvious way leading to it. But as this was not the case, the board concluded that the claimed subject-matter involved an inventive step.

In T 233/93 the combination of properties defining the claimed products had been a desideratum which the skilled community had striven to achieve. These properties, however had been considered to be irreconcilable. The board stated that such a desired product, which may appear obvious per se, may be considered non-obvious and be claimable as such, if there is no known method in the art to make it and the claimed methods for its preparation are the first to produce it and do so in an inventive manner (T 1195/00).

In T 661/09 the board concluded that the features actually claimed merely expressed obvious desiderata at an abstract level.

9.19. Examples of lack of inventive step

9.19.1 Foreseeable disadvantageous or technically non-functional modifications

In some decisions the subject-matter was found not to involve an inventive step, when the invention was the result of a foreseeable disadvantageous modification of the closest prior art (T 119/82, OJ 1984, 217; T 155/85, OJ 1988, 87; T 939/92, OJ 1996, 309; T 72/95; T 694/13).

The board in T 119/82 (OJ 1984, 217) had already found that disadvantageous modifications did not involve an inventive step if the skilled person could clearly predict these disadvantages, if his assessment was correct and if these predictable disadvantages were not compensated by any unexpected technical advantage. More recently, the board in T 2197/09 confirmed that inventive step cannot be acknowledged on the basis of a purely disadvantageous modification of the closest prior art.

9.19.2 Technical standards

In T 519/12 the board held that it had to be expected of the skilled person that he would exercise his skills in the framework of technical standards in force in his field of activity. No inventive activity could be derived from a feature that simply reflected the contents of such a technical prescription.

9.19.3 Reversal of procedural steps

The mere reversal of procedural steps in the production of component parts could not provide justification for inventive step (T 1/81, OJ 1981, 439).

9.19.4 Purposive selection

If, for a particular application of a known process, the skilled person could obviously use a material generally available on the market and suitable for the purpose, and was also highly likely to use it for reasons irrespective of its characteristics, such use should not be considered as inventive on account of those characteristics alone. It stood to reason that if carrying out such a step was itself already obvious for other reasons, the natural choice of the particular means on the market-place was devoid of mental or practical effort, or of "purposive selection", in the absence of anything to the contrary (T 513/90, OJ 1994, 154; see also T 659/00).

No inventive step is entailed in accepting a lower yield likely when using a more readily available raw material (e.g. where industrial hemp is substituted for marijuana (cannabis), the latter being more readily available for legal reasons) (T 636/09).

9.19.5 Automation

In T 775/90 the board ruled that mere automation of functions previously performed by human operators was in line with the general trend in technology and thus could not be considered inventive (T 1175/02, T 438/06, T 734/13, T 711/14).

The mere idea of executing process steps automatically, e.g. replacing manual operation by automatic operation, was a normal aim of the skilled person (T 234/96).

In developing an automated process from a known manual process, apart from simply automating the individual steps of the manual process, the skilled person will also incorporate the facilities that automation typically offers for the monitoring, control and regulation of the individual process steps, provided they fall within the definition of technical skill (T 850/06).

9.19.6 Enhanced effect

According to the case law of the boards of appeal enhanced effects could not be adduced as evidence of inventive step if they emerged from obvious tests (T 296/87, OJ 1990, 195; T 432/98; T 926/00; T 393/01).

In T 308/99 the claimed use was based on a thoroughly obvious property of known substances. The slightly enhanced effects associated with the claimed use in comparison with substances used in prior art emerged from obvious tests.

In T 104/92 the board held that work involving mere routine experiments, such as merely conventional **trial-and-error** experimentation without employing skills beyond common general knowledge, lacked inventive step.

In T 253/92 the subject-matter of claim 1 related to a process for the manufacture of a permanent-magnet alloy. In the board's view, a skilled person would have regarded it as

obvious to try out a variety of alloys known from the prior art to be of similar composition to those of the better examples and to measure their magnetic properties.

In T 423/09 the board stated that the enhanced effect did not emerge from routine tests but from the practice to be followed according to the rules and recommendations of the handbook. The skilled person following the recommended practice prescribed in this handbook, and thus acting only routinely would inevitably obtain this enhanced effect, which therefore could not be taken as an indication of inventive step.

9.19.7 Simplification of complicated technology

In T 61/88 the board indicated that, in the face of an optimal but sophisticated solution to a technical problem, the skilled person could not be denied the capacity to recognise that less complicated alternatives generally achieved less perfect results and consequently to envisage such alternatives, at least in situations in which the advantages of decreased complexity could reasonably be expected to outweigh the resulting loss of performance (T 817/94).

In T 505/96 the board concluded that the simplification of complicated technology in situations in which the advantages of decreased complexity could reasonably be expected to outweigh the resulting loss of performance must be considered to be part of the normal work of the person skilled in the art.

9.19.8 Choice of one of several obvious solutions

A merely arbitrary choice from a host of possible solutions cannot be considered inventive (T 939/92, OJ 1996, 309; T 739/08; T 1175/14). In T 400/98 the board stated that applying one of the possible solutions which were available to the skilled person requires no particular skills and hence does not involve an inventive step (T 107/02).

In T 588/99 the board stated that in the particular situation where a document explicitly defines any compound having a certain activity as a suitable component of a detergent composition, and urges the skilled person to look for such compounds in publications of other technical fields such as biochemistry and medicine, it requires no inventive activity to solve the technical problem of providing an alternative to the compositions disclosed in such prior art by replacing the explicitly specified compounds having the given activity with any other such compounds which may be found by exploring the other technical fields.

In T 190/03 of 29 March 2006 the board stated that in connection with the obviousness of a solution chosen from various possibilities, it is sufficient that the one chosen is obvious and not necessarily relevant that there are several other possible solutions. The board referred to T 939/92 (OJ 1996, 309) where it was stated that (albeit in the field of chemistry) an arbitrary selection of a solution from a number of possibilities in the absence of a hint to do so is not inventive if not justified by a hitherto unknown technical effect that distinguishes the claimed solution from the other solutions. In the case before it, the board could not see any unknown or surprising effects, but only immediately predictable ones. The board in T 1941/12 stated inter alia: the two specific strains chosen in claims 1 and 6

represented an arbitrary selection of strains already known from the prior art to provide the desired effect of strengthening natural immune defences. Such **an arbitrary selection, by the very fact of it being arbitrary**, did not involve any inventive step. This was even more so since the two specific strains chosen were known from the prior art as commercially available.

In T 892/08 the board referred to the established case law whereby, when the technical problem is simply that of providing a further composition of matter or a further method, i.e. an alternative to the prior art, any feature or combination of features already conventional for that sort of composition of matter or method represented an equally suggested or obvious solution to the posed problem. The boards have repeatedly established that the simple act of arbitrarily selecting one among equally obvious alternative variations is devoid of any inventive character (see also T 311/95).

9.19.9 Several obvious steps

If the technical problem that the skilled person has set himself to solve brings him to the solution step by step, with each individual step being obvious to him in terms of what he has achieved so far and what remains for him to do, the solution is obvious to the skilled person on the basis of the prior art, even if two or more such steps are required, and it does not involve an inventive step (T 623/97, T 911/98, T 558/00, T 1514/05).

9.19.10 Selection from obvious alternatives

In T 1072/07 the application related to an oxygen-fired front end for a glass forming operation. The prior art documents proposed two possibilities for solving the problem of choosing the fuel for the burners and thus two types of burners, an air-gas fired burner or an oxygen-gas fired burner. The board concluded that to solve the problem (how to select a suitable type of burner), the person skilled in the art had to make a choice between two well-known possibilities. Either choice, which in a particular situation would be based on balancing the advantages of the specific type of burner being selected, such as efficiency in its operation, with its disadvantages, such as technical adaptations required and costs involved, was obvious, since the types of burner to be chosen from were well-known.

In T 1045/12 the appellant (applicant) argued that the solution to the objective technical problem taught by D3 was one of several, equally likely options and that the board had to provide a reason why the skilled person would have selected the claimed option. The board disagreed. The fact that there were other options had no bearing on the obviousness of one specific option. Furthermore, if all options were equally likely, then the invention merely resulted in an obvious and consequently non-inventive selection among a number of known possibilities.

9.19.11 Putting the closest prior art device into practice

In T 405/13 the invention was a meter with rapid response glucose sensor. The question was whether or not the skilled person, while putting the meter of D10 (biosensing meter) into practice, would arrive at a value falling within the claimed range (for a similar approach

see T.408/12 and T.315/97 of 21 June 2002). In the board's view, no inventive step could be seen in including in the reasonably broad time range as required by the timing circuit of the meter of D10 the claimed value of 5 seconds after the detection of sample application, the less so since reducing measurement time had to be considered as an obvious desire of the user.

9.19.12 Animal testing and human clinical trials

In T.1493/09 the board found that the skilled person seeking to solve the problem formulated (provision of a broadly effective vaccine against HPV, especially providing broad protection against cervical cancer) would have considered not only formulations for immediate use in human clinical trials but also additional animal testing. It took the view that its assessment according to the problem and solution approach applied for the same reasons to claim 1 of auxiliary request 1 (directed to the second medical use of the vaccine composition and including the therapeutic effect "prevention or treatment of a disorder related to HPV infection" as an explicit feature), and concluded accordingly that it too lacked inventive step.

10. Secondary indicia in the assessment of inventive step

10.1. General issues

According to established case law of the boards of appeal, a mere investigation for indications of the presence of inventive step is no substitute for the technically skilled assessment of the invention vis-à-vis the state of the art pursuant to Art. 56 EPC. Where such indications are present, the overall picture of the state of the art and consideration of all significant factors may show that inventive step is involved but this need not necessarily always be the case (see T.24/81, OJ 1983, 133 and T.55/86). Secondary indicia of this kind are only of importance in cases of doubt, i.e. when objective evaluation of the prior art teachings has yet to provide a clear picture (T.645/94, T.284/96, T.71/98, T.323/99, T.877/99). Indicia are merely **auxiliary considerations** in the assessment of inventive step (T.1072/92, T.351/93).

In T.754/89 – "EPILADY" the board detailed its reasons for ruling that an inventive step was involved. Although factors such as commercial success, the overcoming of prejudice, the age of the documents cited, the cost of advertising and the creation of a new market segment, the satisfaction of a long-standing need, the existence of imitations and forms of infringement had received considerable attention, particularly in the parties' written submissions, the technical facts of the case were such that secondary indications of inventive step had lost any relevance.

In T.915/00 the board held that commercial implementation, licensing and the recognition of the inventor's merits by the scientific community constituted further convincing secondary indicia for the presence of inventive step.

In T.1892/12 the board observed that the boards had in some cases taken account of "secondary indicia" that an inventive step was involved but had not so far done so for the

purposes of establishing that it was lacking. According to Art. 56 EPC, an invention shall be considered as involving an inventive step if, having regard to the state of the art, it is not obvious to a person skilled in the art. In view of the negative definition in Art. 56 EPC, the board considered that inventive step could never in fact be proven but that secondary indicia might sometimes show it was plausible. A lack of inventive step by contrast could actually be proven by conclusively showing that a solution was obvious. So proving a lack of inventive step was possible, in principle, and indeed necessary where such a lack was alleged; it was then not enough to point to secondary indicia.

10.2. Technical prejudice

According to the case law of the boards of appeal (see T 119/82, OJ 1984, 217; T 48/86), inventiveness can sometimes be established by demonstrating that a known prejudice, i.e. a widely held but incorrect opinion of a technical fact, needs to be overcome. In such cases, the burden is on the patentee (or patent applicant) to demonstrate, for example by reference to suitable technical literature, that the alleged prejudice really existed (T 60/82, T 631/89, T 695/90, T 1212/01). A high standard of proof to demonstrate prejudice is required (T 1989/08).

A prejudice in any particular field relates to an opinion or preconceived idea widely or universally held by experts in that field. The existence of such prejudice is normally demonstrated by reference to the literature or to encyclopaedias published before the priority date. The prejudice must have existed at the priority date, any prejudice which might have developed later is of no concern in the assessment of inventive step (T 341/94, T 531/95, T 452/96, T 25/09).

Generally speaking, prejudice **cannot** be demonstrated by a statement in a single patent specification, since the technical information in a patent specification or a scientific article might be based on special premises or on the personal view of the author. However, this principle does not apply to explanations in a standard work or textbook representing common expert knowledge in the field concerned (T 19/81, OJ 1982, 51; T 104/83; T 321/87; T 392/88; T 519/89; T 453/92; T 900/95; T 1212/01). In T 515/91 the board regarded "ABC Naturwissenschaft und Technik" as a standard work (see also T 461/92, T 152/93). In T 943/92 the existence of a prejudice was supported by a specialist book which reflected the technical knowledge in the special field of the contested patent. This book did not contain the opinion of just one specialist author, but that of experts in the field, as it had resulted from the collaboration of "numerous recognised scientists, technicians and practitioners as well as associations and institutes". General critical remarks in one textbook were not sufficient to substantiate an alleged prejudice, if a plurality of prior art documents pointed to the opposite (T 134/93).

Generally speaking, established board of appeal case law is **very strict** when it comes to recognising the existence of a prejudice. A solution put forward as overcoming a prejudice must clash with the prevailing teaching of experts in the field, i.e. their unanimous experience and notions, rather than merely cite its rejection by individual specialists or firms (T 62/82, T 410/87, T 500/88, T 74/90, T 943/92, T 531/95, T 793/97, T 2453/09). A declaration by a technical expert in the field was not interpreted as evidence that there

was a prejudice in the prior art at the priority date; rather, this declaration was taken as the opinion of one expert, issued almost ten years after the priority date (T. 2044/09). The fact that a disadvantage is accepted or the prejudice simply ignored does not mean that a prejudice has been overcome (T. 69/83, OJ 1984, 357; T. 262/87; T. 862/91).

The board in T. 1989/08 observed that this meant the standard of proof was almost as high as that required for common general knowledge in the art. For example, it is not enough that the opinion or idea is held by a limited number of individuals or that it is a prevalent view within a given firm, however large. In the case in hand all the evidence offered in support of the alleged prejudice amounted to no more than ten documents, all of which were either specialist papers or patents. This small number of publications intended for a select readership in the field was in itself a tenuous basis for asserting prejudice (see also T. 25/09).

In T. 1212/01 the patent related to pyrazolopyrimidinones for the treatment of impotence (Viagra). The patentee referred to some thirty scientific articles in order to demonstrate the existence of a technical prejudice that drugs lowering blood pressure were a cause of impotence rather than a form of treatment for that condition. The board, however, stated that the contents of such a selection from the prior art could not be considered per se as creating a technical prejudice against oral treatment of male erectile dysfunction. Such a prejudice could only be established by proving that, in relation to the technical solution, a relatively widespread error or misapprehension about the technical invention existed among skilled workers in the relevant field before the priority date of the patent in suit. This was not the situation in the case in hand.

In T. 550/97 the respondent (patent proprietor) had argued that, years after the invention, technically less advanced solutions had been filed for and marketed as a means of integrating different mobile radio networks. However, the board did not consider the fact that arguably less advanced solutions had been developed later, to be evidence of inventive step, as there was no reason to assume that later development was attributable to a technical prejudice which the invention had needed to overcome.

In T. 347/92 the board pointed out that the finding of a relatively small operating window in an area which, according to the teaching of the most recent publications, was considered inaccessible, could not be considered obvious to a person skilled in the art.

One form of secondary indicia in the nature of a "technical prejudice" is a **development of the art in a different direction** (T. 24/81, OJ 1983, 133; T. 650/90; T. 330/92).

In T. 883/03 the board found that the teaching that could have led to the characterising feature of claim 1 had long formed part of the state of the art; yet for all that time experts had been "**blind**" to that knowledge. In the case in point that was a further indication of the inventiveness of the solution proposed in claim 1.

In T. 872/98 the board pointed out that the presence of secondary indicia might also be attested by the fact that a competitor had, shortly after the priority date, filed a patent

application with the German Patent Office in which the invention took an entirely different direction to the European application.

In T 779/02 the board indicated that a prejudice could be proved by the fact that the closest prior art and the invention were separated by a long period of time (over 16 years in the case in hand), during which time the only solutions pursued led away from the invention, and the solution provided by the invention only becoming acceptable to experts in the field after this time.

10.3. Age of documents – time factor

The age of documents known long before the filing date might only be an indication of an inventive step if a need for the solution of an unsolved problem had existed for the entire period between the date of the documents and that of the invention (T 79/82, T 295/94). Nevertheless, the long period of time to be considered was not the period that had elapsed between the publication of a document and the filing of the European patent application disclosing the teaching of that document, but that between the time the problem became apparent and the date of filing of the European patent application providing a solution (T 478/91).

A period of 23 years between the publication date of the document deemed to be the closest prior art and the priority date of the contested patent in an economically significant and frequently studied field could normally be viewed as an indication of the presence of inventive step (T 273/92). In T 203/93 and T 795/93 a period of 11 years was considered to be an indication in support of inventive step, in T 986/92 a period of 70 years, in T 478/91 80 years and in T 626/96 60 years. See also T 774/89, T 540/92, T 957/92, T 697/94, T 322/95, T 255/97, T 970/97, T 6/02, T 2271/08.

In T 330/92 the documents reflecting the general knowledge available to experts in the field of the application (injection mould technology for cashcard holders) had been published at least 17 years before the filing date of the contested patent. The board of appeal pointed out that the elements which could have led to the feature combination of claim 1 had thus long been known in the prior art. Nevertheless the experts had for all this time been "blind" to these findings. Nor had other applicants in the same field made use of the knowledge in question.

In T 1077/92 the board faced the unusual situation of a problem and its ready solution having co-existed for 100 years in general, and more recently in a field of intensive research, and still the seemingly obvious step had not been taken. The board concluded that, as no other explanation could be found, this must have been because inventive insight was needed (T 617/91).

In T 123/97 the failure to adopt an obvious solution to the technical problem underlying the patent in suit may have resulted from a variety of causes; for example, there may have been a commercial reason for not adopting this new technique, because the old technique was found satisfactory by the clients and could also be improved, thus avoiding

considerable investment costs involved in the adoption of a new technique on an industrial scale.

The board in T. 833/99 found that, in addition to the other factors it had mentioned in examining whether a method of producing a grooved-rail frog for tramlines was inventive, it also had to be taken into account that citation D1 dated from 1930 and that, in the 60 years between it and the invention at issue, no skilled person had had the idea of taking up what it suggested and applying the method described to a single-piece frog. That was a serious indication of non-obviousness which could not be ignored.

The board in T. 1192/09, having found that there was an inventive step, added that the actual developments in the relevant technical field, as evidenced by the documents on file, provided additional support in favour of an inventive step. The board noted in this respect that D8 (closest prior art) had been published about 12 years before the filing date of the patent in suit. The fact that the very inventors of D8 had not proposed the claimed structure, with its uncontested advantages, until 12 years after the publication of D8, and that this structure had later been praised in D10 (European patent, same inventors as D8, underlying application filed two months after the patent in suit) and made the subject of a granted European patent was considered by the board to be an additional indication of the non-obviousness of the concept which formed the basis of the claimed invention.

10.4. Satisfaction of a long-felt need

The fact that the state of the art has been inactive over a long period prior to the invention may be an indication that an inventive step is involved if during that time an urgent need for improvement has demonstrably existed (see T. 109/82, OJ 1984, 473; T. 555/91; T. 699/91). This indication is closely linked to the positive indications of the time factor and age of the cited document.

In T. 605/91 the board stated that it was not sufficient if only one individual skilled person discovered a "long-felt need". Only if various and repeated attempts to deal with the relevant disadvantages could be identified would such a long-felt need appear to have persisted.

In T. 1014/92 the board did not accept the appellant's further argument that the long period of time (about 35 years) during which documents (1) and (2) had been available to the public without having been combined, was in itself cogent evidence that there was no obvious connection between them. The board held that this conclusion might only be drawn if evidence relating to time were corroborated by other evidence, such as long-felt want (see also T. 1183/06).

Where a process had been performed successfully on a commercial scale for more than 20 years in spite of economic disadvantages associated with it, and the claimed invention provided a solution to the technical problem of avoiding such economic disadvantages, this supported a finding of inventive step (T. 271/84, OJ 1987, 405).

10.5. Commercial success

In principle, commercial success alone is not to be regarded as indicative of inventive step. The following requirements must first be met; a long-felt need must have been fulfilled, and the commercial success must derive from the technical features of the invention and not from other influences (e.g. selling techniques or advertising).

In T 110/92 the board did not dispute that the heating assembly according to claim 1 might have been a commercial success. However, such a commercial success alone, with the technically relevant examination of the claimed subject-matter leading to a negative result, could not be regarded as forming the basis for an indication of inventive step even if the board were convinced that the success derived from technical features of the heating assembly and not from other causes such as those of a commercial nature (see also T 5/91, T 219/90, T 373/94, T 109/15).

In T 478/91 too, commercial success was not regarded as indicative of inventive step. The board pointed out that it was well known that the commercial success of a product could just as easily be due to factors other than its properties, in particular more streamlined manufacture, a market monopoly, advertising campaigns or efficient selling technique (see T 270/84, T 257/91, T 712/92).

In T 1212/01 the patent related to pyrazolopyrimidinones for the treatment of impotence (Viagra). The board stated that in order to establish commercial success as an indicia of inventive step two evidentiary steps were required. Firstly, commercial success must be demonstrated and, secondly, it had to be shown that such success resulted from the claimed invention and not from one or more other causes. Viagra had been the subject of various awards and praise in various journals. The board stated that the prizes would have been significant if awarded by persons who understood patent law. If however the prizes were awarded for the product's life-enhancing nature, or for the appellants' high standard of research, or for a high level of sales, then, for all that any of those reasons might well be prize-worthy, the prizes can have no significance in the context of inventive step. The board arrived at the conclusion that the evidence did not establish that the "prizes and praises" resulted from the claimed inventive step.

In T 677/91 the board took the commercial success of the claimed invention into consideration and stated that it would have been wrong to ignore the practical impact that the invention had made in its own field since the priority date. For example, in several passages of a textbook, reference was made to the fact that the various advantages of the claimed invention had brought in a new era in this special field. The board concluded that it was difficult to reconcile the contents of such passages with the idea that the claimed invention was a matter of mere routine development and thus held that the invention involved an inventive step.

In T 626/96 the invention had likewise achieved great commercial success and gained widespread recognition in a number of countries. Furthermore, the success was achieved in a very short space of time, so that there seemed to be a pressing commercial need for

this simple solution. Furthermore, the success was directly attributable to the structure of the product claimed and was not due to marketing techniques or advertising skills.

10.6. Market competitors

Market competitors' efforts to obtain rights of joint use constitute further secondary indicia closely related to commercial success. They may result in a positive decision on inventive step, but need not necessarily do so. In T.351/93 the board stated that the latter applied particularly where a technical and expert assessment of the invention in the light of the prior art led, according to the problem and solution approach, to the conclusion that the existence of inventive step had to be denied.

The case was slightly different in T.812/92 – the situation might arise where, shortly before the filing date of the contested patent, one of the patent proprietor's competitors offered a customer a technical apparatus without reducing to practice the advantageous technical solution according to the invention. This might be an indication that an inventive step was involved.

In T.252/06 the board confirmed the presence of inventive step *inter alia* on the grounds that the patent proprietor's competitors had used the patent's teaching and had filed applications relating to it.

10.7. Simple solution

In a technical field of commercial importance to which considerable attention is directed the simplicity of a proposed solution may indicate inventive step. The difficulty of developing a simple solution without sacrificing quality may therefore indicate inventive step (T.106/84, OJ 1985, 132; T.229/85, OJ 1987, 237; T.9/86, OJ 1988, 12; T.29/87; T.44/87; T.528/89; T.73/95). This did however presuppose the absence in the prior art of anything that hinted at the proposed solution (T.712/92).

In T.234/91 it was pointed out that experience in structural engineering showed that with the same or even an improved effect – in the case in point an increase in reliability – it was often much more difficult to identify and achieve a simple solution than complicated embodiments. In view of the large number of solutions suggested in the technical literature, the board came to the conclusion that the improvement achieved by the simple structural measure suggested in the contested patent had not been obvious (see also T.330/87).

In T.349/95 the subject-matter at issue related to a simple form of a simple device, a device which, however, had brought about a surprising major functional improvement. In the board's view, this surprising improvement and the fact that the prior art gave no clear hint of the solution constituted evidence of the inventiveness of the claimed solution.

A different aspect was dealt with in T.113/82 (OJ 1984, 10). In order to proceed from the known art to the invention, a series of steps needed to be taken. The board stated that this could be considered as an indicator of the presence of inventiveness, particularly in a case where the last decisive step had neither been proved to be known from the prior art nor

was derivable therefrom, although this last step might at first sight seem to be a very simple one (see also T 315/87 of 13 September 1989; T 508/88; T 424/89; T 394/90).

A solution is not obvious simply because its success is plausible. That success is plausible once a solution is known does not necessarily mean that the solution itself was already obvious to the skilled person. Whether success is plausible and whether the solution itself is obvious are two distinct matters requiring separate investigation (T 862/11).

10.8. Surprising effect – bonus effect

An effect which may be said to be unexpected can be regarded as an indication of inventive step (T 181/82, OJ 1984, 401). However, certain preconditions have to be met. In T 21/81 (OJ 1983, 15) the board considered that if, having regard to the state of the art, it would already have been obvious for a skilled person to arrive at something falling within the terms of a claim, because an advantageous effect could be expected to result from the combination of the teachings of the prior art documents, such claim lacked inventive step, irrespective of the circumstance that an extra effect (possibly unforeseen) was obtained (see T 365/86, T 350/87, T 226/88). This case law was also confirmed in T 69/83 (OJ 1984, 357). Where, because of an essential part of the technical problem being addressed, the state of the art obliged a skilled person to adopt a certain solution, that solution was not automatically rendered inventive by the fact that it also unexpectedly solved part of the problem. Therefore, an unexpected bonus effect does not confer inventiveness on an obvious solution (T 231/97). If it is obvious for the skilled person to combine prior art teachings in order to solve an essential part of the problem, the presence of even an unexpected extra effect allowing another part of the problem to be solved at the same time does not in principle imply the presence of inventive step (T 170/06).

Furthermore, in T 192/82 (OJ 1984, 415) the board stated that the skilled person had to be free to employ the best means already available for his purposes, although the use of means leading to some expected improvements might well be patentable in relying on an additional effect, provided this involved a choice from a multiplicity of possibilities. The lack of alternatives in this respect might therefore create a **"one-way-street"** situation leading to predictable advantages which remained obvious in spite of the existence of some unexpected "bonus" effect (T 1936/13). The board also pointed out in T 506/92 that an additional effect achieved inevitably by the skilled person on the basis of an obvious measure without any effort on his part simply represented a bonus under EPO case law which could not substantiate inventive step, even as a surprising effect (see also T 766/92, T 431/93, T 681/94, T 985/98, T 794/01, T 1192/09, T 688/13, T 2456/13). In T 848/94 the solution of the existing technical problem required a combination of measures that was not suggested by the prior art in such a manner that it would have been adopted by the person skilled in the art. Therefore, the person skilled in the art was not in a "one-way-situation".

The board in T 936/96 held that, once a realistic technical problem had been defined and once it had been established that a particular solution to such a problem would have been envisaged by a skilled person in the light of the relevant state of the art, that solution could not be said to involve an inventive step, and this assessment was not altered by the fact that the claimed invention inherently also solved further technical problems. In the case in

point the claimed surprising effect could not be regarded as an indication of the presence of an inventive step.

In T. 227/89 the board stated that in determining which effect was crucial and which was merely accidental (the so-called "bonus effect"), a realistic approach had to be taken, considering the relative technical and practical importance of those effects in the circumstances of a given case (see also T. 732/89 and T. 729/90). When assessing chemical substances for inventive step, it is often their surprising properties that are considered (see in this connection T. 20/83, OJ 1983, 419).

According to the boards' case law, an improvement is not a prerequisite for inventive step. In T. 154/87 it was pointed out that the achievement of a surprising effect was no precondition for the existence of inventive step. All that was necessary was to ascertain that the respective subject-matter could not be derived by the skilled person in an obvious manner from the available prior art (T. 426/92, T. 164/94, T. 960/95, T. 524/97, T. 888/08).

In T. 551/89 the board stated that an effect which was to be expected as the result of an obvious measure could not contribute to recognition of the required inventive step, even if the scale of this effect was surprising to the skilled person. In this case an effect whose scale surpassed the skilled person's hopes merely represented a bonus effect following inevitably from the use of an obvious measure and obtained by the skilled person without any inventive effort on his part (T. 506/92, T. 882/94).

In T. 240/93 the application related to an apparatus for the surgical treatment of tissues by hyperthermia, equipped with heat protection means. The application was refused by the examining division, which considered the short treatment duration of one hour and further advantages resulting from the use of cooling means to be extra (bonus) effects. The board, however, stated that in the case in point the objective problem underlying the invention was to provide an apparatus for the effective therapeutic treatment of benign prostate hyperplasia in a short period of time. In view of the many considerable practical advantages of a single one-hour hyperthermia session for a patient, such a short treatment duration could not be dismissed as a mere "bonus" effect, but was crucial to the invention and the basis of the objective problem.

10.9. Comparative tests

According to the established jurisprudence, a surprising effect (advantageous effect or feature) demonstrated in a comparative test can be taken as an indication of inventive step. If comparative tests are chosen to demonstrate an inventive step on the basis of an improved effect, the nature of the comparison with the closest state of the art must be such that the alleged advantage or effect is convincingly shown to have its origin in the distinguishing feature of the invention compared with the closest state of the art (T. 197/86, OJ 1989, 371; T. 234/03; T. 378/03; T. 568/11; T. 1457/13; T. 1521/13; T. 1401/14) and alleged but unsupported advantages cannot be taken into consideration in respect of the determination of the problem underlying the invention (see also chapter I.D.4.2. "Alleged advantages"; T. 20/81, OJ 1982, 217; T. 561/94).

In T.197/86 (OJ 1989, 371) the board supplemented the principles laid down in earlier decision T.181/82 (OJ 1984, 401), according to which, where comparative tests were submitted as evidence of an unexpected effect, there had to be the closest possible structural approximation in a comparable type of use to the subject-matter claimed. In the case in point the respondent (patent proprietor) strengthened support for its claim by voluntarily providing comparisons with variants which, although not expressly belonging to the prior art, differed from the claimed subject-matter only by the distinguishing feature of the invention. The board summarised its position by stating, that in cases where comparative tests were chosen to demonstrate an inventive step with an improved effect over **a claimed area**, the nature of the comparison with the closest state of the art had to be such that the effect was convincingly shown to have its origin in the distinguishing feature of the invention. For this purpose it might be necessary to modify the elements of comparison so that they differed only by such a distinguishing feature (T.292/92, T.412/94, T.819/96, T.133/01, T.369/02, T.668/02, T.984/03, T.2043/09).

As early as T.35/85 the board had stated that an applicant or patentee may discharge his onus of proof by voluntarily submitting comparative tests with newly prepared variants of the closest state of the art identifying the features common with the invention, in order to have a variant lying closer to the invention so that the advantageous effect attributable to the distinguishing feature is thereby more clearly demonstrated (T.40/89, T.191/97, T.496/02).

It is for the applicant (patentee) to furnish evidence of an improved effect of the subject-matter of a claim, which has been asserted, but was not mentioned in the application as filed, in the whole of the claimed area vis-à-vis the closest prior art (T.355/97, T.1213/03, T.653/07).

In T.415/11 the board stated when the credibility that a technical effect is achieved by substantially all claimed compounds is at issue and in a situation where, it is prima facie unlikely that this is credible, it is not the opponent, but the patentee who has the burden of proving that the effect is achieved (see for example T.939/92, OJ 1996, 309; T.97/00).

In T.390/88 the board stated that where an alleged invention was prima facie obvious having regard to the prior art, it was however sometimes possible to prove inventiveness by comparative tests showing a significant improvement over the closest prior art. That situation was to be contrasted with other cases, in which it was not prima facie obvious to make the claimed compounds at all, and therefore comparative tests were not essential to establish inventiveness (see also T.656/91, T.930/99).

In T.702/99 the board stated that in cases concerning products such as cosmetics, in which applicants or patentees seek to establish that their inventions have an improved "feel" over the prior art, or opponents seek to deny such an improved "feel", it is common for one or more parties to file evidence of comparative tests conducted by a number of persons. It is essential for such tests to be made under conditions which ensure maximum objectivity on the part of those conducting the tests and who may be required at a later date to give evidence in proceedings. It is always desirable that such tests can be shown to be "blind" and that they have been conducted in the strictest conditions; that the testers

have had no part in the making of the claimed invention or research leading up to the invention or the patenting procedure. See also T. 479/06, T. 275/11, T. 1962/12, T. 165/14, T. 795/14, T. 2304/16.

In T. 234/03 the board stated that to be of relevance in demonstrating that a technical improvement is achieved in comparison with the closest state of the art, any comparative test presented must be reproducible on the basis of the information thus provided, thereby rendering the results of such tests directly verifiable (T. 494/99). This requirement implies, in particular, that the procedure for performing the test relies on quantitative information enabling the person skilled in the art to reproduce it reliably and validly. Vague and imprecise operating instructions render the test inappropriate and thus irrelevant.

In T. 172/90 the comparative examples produced did not constitute suitable evidence of inventive step. The board said that the products adduced as a basis of comparison were commercially available and had evidently been selected at random. Technical progress shown in comparison with products of this kind could not be a substitute for the demonstration of inventive step with regard to the closest prior art (see also T. 164/83, OJ 1987, 149; T. 730/96).

E. The requirement of industrial application under Article 57 EPC

1. Notion of "industrial application".....	274
1.1. Invention and industrial application.....	274
1.2. Any kind of industry.....	276
1.2.1 Methods applied in the private and personal sphere.....	276
1.2.2 Cosmetic and beauty salons.....	277
2. Reproducibility and sufficiency of disclosure.....	277
3. Indication of a profitable use of the invention in industry.....	278

1. Notion of "industrial application"

Art. 57 EPC provides that: "An invention shall be considered as susceptible of industrial application if it can be made or used in any kind of industry, including agriculture". It thus defines the third criterion for patent grant referred to in Art. 52(1) EPC, namely "industrial application", making it clear that the possibility of making or using the invention in any kind of industry is sufficient (T 144/83) and that agriculture too is a kind of industry for the purposes of the EPC (T 116/85, OJ 1989, 13). Both products and processes (T 208/84) are susceptible of industrial application. Claims directed to substances or compositions for use in methods for treatment of the human or animal body by therapy are directed to inventions which are susceptible of industrial application (G 1/83).

In T 80/96 (OJ 2000, 50), the board found that the use of a substance to make a new pharmaceutical product without delimitation to an indication did not contravene the requirements of Art. 57 EPC 1973 in conjunction with Art. 52(1) EPC 1973.

Regarding the amendments to Art. 52(1) EPC in the course of the revision of the EPC, see chapter I.A.1. "Patent protection for technical inventions".

1.1. Invention and industrial application

The requirement of industrial application must be satisfied in addition to the other patentability criteria. Art. 57 EPC excludes only a few inventions from patentability that are not already excluded by Art. 52(2) EPC (Guidelines G-III, 3 – November 2018 version), or by Art. 53 EPC. In particular the work of medical practitioners, previously excluded from patentability under Art. 52(4) EPC 1973 as lacking industrial application, is now covered in Art. 53(c) EPC. Industrial application is also lacking if the product or process is contrary to the laws of physics (T 541/96), such as for example a perpetual motion machine (Guidelines G-III, 3 – November 2018 version).

While the technical character of an invention and its susceptibility of industrial application are two different patentability requirements under the EPC, they are often discussed together.

In **T 953/94** the board stated that, as the Convention showed (Art. 52(1) EPC 1973), the requirement (defined in Art. 52(2) and (3) EPC 1973) of claimed subject-matter being an "invention" was distinct from the requirement (defined in Art. 57 EPC 1973) of the claimed invention being "susceptible of industrial application". Even though the former requirement might, *cum grano salis*, be equated with a requirement for a "technical" contribution, this was not the same as a requirement for "industrial" applicability; at least in this context, the terms "technical" and "industrial" were not synonyms. In Art. 57 EPC 1973, the meaning of "industrial" was evidently intended to cover commercial applications; this was made clear, for instance, by the German version ("gewerblich"). In the context of Art. 52(2) EPC 1973, this was clearly not the case for the meaning of "technical". This was because, in the context of "controlling a [...] process", the adjective "industrial" should, other than in the context of Art. 57 EPC 1973, be understood to relate only to technical processes usually occurring in "industry" (this latter term in its present context being understood in the narrower sense of what in German would be called "Industrie") and thus not as including "commercial", or even "financial", applications (see also **T 208/84** and **T 854/90**).

In **T 533/09** the board found that the claimed pulse train was of a tangible nature in that it was the result of modulating an electrical signal (derived from a capacitor discharge for defibrillation purposes) and its intensity was measurable at any time. Such a signal thus clearly came under the definition of "physical entity" within the meaning of **G 2/88** (OJ 1990, 93), in its original version. The board concluded that the nature of the subject-matter of claim 1 of the main request was no obstacle to its patentability; moreover, as there could be no doubt that such a signal could be produced and used for defibrillation purposes, that subject-matter clearly was susceptible of industrial application and thus met the conditions of Art. 57 EPC 1973. The board concluded that the wording chosen by the legislator for Art. 52 to 57 EPC on patentability does not in any way link the notion of patentable invention with any condition requiring such an invention to be of a tangible, viz. material, nature (see point 7.2 of the Reasons).

In **T 204/93** the board held that commercial use excluded from patentability under Art. 52(2)(c) and (3) EPC 1973 (in so far as it was not construed as a method for doing business) was a feature which might be understood to fall within the requirement that an invention had to be susceptible of industrial application (Art. 52(1) EPC 1973), i.e. that it could be made or used in any kind of industry (Art. 57 EPC 1973); reference was made in particular to the German word "gewerblich" in that provision of the Convention. The board noted that it was not disputed that computer programs could be exploited commercially. The exclusions from patentability defined in Art. 52(2) and (3) EPC 1973 did not in any way refer to the requirement in Art. 52(1) EPC 1973 of "industrial application" but to the requirement in that Article that the subject-matter claimed had to be an "invention". The exclusions in Art. 52(2) and (3) EPC 1973 were generally understood to share the common feature that the excluded matters lacked technicality but not that they could not be made or used, e.g. traded. In this case the board denied patentability for lack of technical effect.

1.2. Any kind of industry

Industry is subject to broad interpretation in this context (T 74/93) and extends to any activity that is carried out continuously, independently and for financial gain (T 144/83) or that can be offered commercially by a company (T 1165/97). The case law refers to the concepts of "financial (commercial) gain" (T 144/83) and of "profitable use" (T 870/04) in relation to industrial applicability (T 898/05). The need to show a "profitable use" is not to be understood in the narrow sense of an actual or potential economic profit (i.e. generating more income than expenditure) or of a commercial interest (i.e. creating a new or increased business opportunity). Rather, it must be understood in the wider sense that the invention claimed must have such a sound and concrete technical basis that the skilled person can recognise that its contribution to the art could lead to practical exploitation in industry (T 898/05). This interpretation therefore does not extend for example to inventions that merely amount to a research finding (T 870/04; T 338/00) or that are applied for exclusively private and personal purposes.

1.2.1 Methods applied in the private and personal sphere

In T 74/93 (OJ 1995, 712) the application was refused by the examining division because claim 5, which was directed to the use of a contraceptive composition (e.g. a cream) for applying to the cervix of a female capable of conception, was not susceptible of industrial application as required by Art. 57 EPC 1973 in so far as the compound was to be applied to the cervix of a human female.

The board stated that in determining the borderline between industrial activities – in which the effects of patents had to be respected – and private and personal activities, which should not be adversely affected by the exercise of these rights, the board took into consideration the fact that Art. 57 EPC 1973 might be regarded as an expression of the general idea that any natural person had the right to have his or her privacy respected. The core of this right was not to be taken away from anybody. Therefore the fact that for some women contraception was connected with professional activities did not give an act, which was in essence private and personal, an industrial character. The board noted that this did not apply to contraception in general, but to the specific type of application of a composition as claimed in claim 5.

The board was unable to ascertain any field of industrial application for the direct use defined in claim 5, for which the requirement of Art. 57 EPC 1973 had to be met. The question as to whether it would be sufficient for an industrial application to be expected in future could be left unanswered as this assertion had not been further substantiated.

In T 1165/97, the board held that a method of using a vaginal discharge collector and disposing of the collector after a single use could be considered susceptible of industrial application if it was conceivable that these steps were carried out as a paid service and were not exclusively dependent for their execution on the instructions of the woman in question. The board noted that, for the purposes of Art. 57 EPC 1973, what was relevant was the possibility that such a service might be offered by an enterprise. In that case, the board decided in the affirmative, pointing out that – in contrast to the case in T 74/93 – the

service was not one satisfying only the strictly personal needs of the woman in question. Collecting a sample could be caused by external reasons, e.g. on the advice of a medical practitioner to have such a sample taken for further diagnosis.

1.2.2 Cosmetic and beauty salons

In T 144/83 (OJ 1986, 301) the board stated that under Art. 57 EPC 1973 an invention was to be considered as susceptible of industrial application if it could be made or used in any kind of industry. Enterprises in the cosmetic field - such as cosmetic salons and beauty parlours - were part of industry within the meaning of Art. 57 EPC 1973, since the notion of "industry" implied that an activity was carried out continuously, independently and for financial gain. One board had already decided in T 36/83 (OJ 1986, 295) that the professional use of such inventions in a cosmetic salon was an industrial application within the meaning of Art. 57 EPC 1973.

2. Reproducibility and sufficiency of disclosure

Another requirement for an invention to be considered susceptible of industrial application within the meaning of Art. 57 EPC is that the technical teaching disclosed in the application under Art. 83 EPC is reproducible.

In T 718/96 the board held that reproducibility was to be assessed in the first instance with reference to Art. 83 and 100(b) EPC, which lay down that the invention must be disclosed in such a way that it can be carried out by a skilled person. Art. 57 could also serve as a basis for objecting to a lack of reproducibility, because an invention that could not be carried out was also not susceptible of industrial application, but such an objection was always to be based on the most specific applicable provision. Nevertheless, given the link between the two notions, any findings as to reproducibility would apply in equal measure to industrial application under Art. 57 EPC.

In T 1450/07 the board noted that the information in the application as filed should make plausible the identity of the claimed compound. Thus, the compound could be attributed to a known family of molecules on the basis of a comparison between its primary structure and that of molecules known in the art. Then, its putative functions could be disclosed. Experimental evidence was not necessarily needed. A number of reasonable assumptions could be made by taking into account the known functions of other family members as well as, for example and not exclusively, by taking into account the distribution of the claimed compound in the body. The treatments therein mentioned were in relation to the function plausibly attributed to the molecule. Post published evidence backing up these assumptions was always welcome and the quality of the information was also fundamental. The board pointed out that each case had to be evaluated on its own merits. The board decided in the case at issue that the requirement of industrial applicability was fulfilled.

In T 18/09 the board noted that the close inter-relationship between Art. 83 and 57 EPC was already addressed in previous decisions (see inter alia T 898/05). In respect of Art. 83 EPC, established case law of the boards of appeal stated that a patent could only

be objected to for lack of sufficiency of disclosure if there were serious doubts, substantiated by verifiable facts (see T.19/90, OJ 1990, 476). For the board, it would not be justified and unfair to set a different standard of proof in respect of Art. 57 EPC.

In T.541/96 the gist of the invention consisted in inducing nuclear fusion between light nuclei and heavy unstable nuclei at low temperature by means of an electric field. The board held that an invention or an application for a patent on an alleged invention which was incompatible with the generally accepted laws of physics did not meet the requirements of Art. 57 and 83 EPC 1973, because it could not be used and therefore lacked industrial application.

The EPC did not exclude "revolutionary" inventions from being patented. However, Art. 83 EPC 1973 made the amount of information required for a sufficient disclosure of an invention somewhat dependent on the actual "nature" of the invention. However, if the invention seemed, at least at first, to offend against the generally accepted laws of physics and established theories, the disclosure should be detailed enough to prove to a skilled person conversant with mainstream science and technology that the invention was indeed feasible (i.e. susceptible of industrial application). This implied, inter alia, the provision of all the data which the skilled person would need to carry out the claimed invention, since such a person, not being able to derive such data from any generally accepted theory, could not be expected to implement the teaching of the invention just by trial and error.

The appellant had provided neither experimental evidence nor any firm theoretical basis which would enable the skilled person to assess the viability of the invention; the description was essentially based on general statements and speculations which were not apt to provide a clear and exhaustive technical teaching. Thus, it was irrelevant to consider whether the fusion reactions referred to in the description might be theoretically possible, or whether they might indeed occur under certain conditions.

3. Indication of a profitable use of the invention in industry

R. 42(1)(f) EPC (former R. 27(1)(f) EPC 1973) prescribes that the description should "indicate explicitly, when it is not obvious from the description or nature of the invention, the way in which the invention is industrially applicable".

In T.1452/06 the board stated that a basic principle of the patent system was that exclusive rights could only be granted in exchange for a full disclosure of the invention, which included the need to indicate how to exploit the invention (Art. 57 EPC 1973). This indication must have "a sound and concrete technical basis", as a "speculative indication of possible objectives that might or might not be achievable by carrying out further research with the tool as described was not sufficient to fulfil the requirement of industrial applicability" (see T.898/05, T.870/04 and T.1109/10).

In T.898/05 the board found that for the purposes of Art. 57 EPC 1973, a claimed invention had to have such a sound and concrete technical basis that the skilled person could recognise that its contribution to the art could lead to practical exploitation in industry. The board explained that while industrial applicability should be construed broadly, to include

any "immediate concrete benefit", this also entailed the need to disclose in definite technical terms the purpose of the invention and how it could be used in industrial practice to solve a given technical problem, this being the actual benefit or advantage of exploiting the invention. There had to be at least a prospect of a real as opposed to a purely theoretical possibility of exploitation, if it was not already obvious from the nature of the invention or from the background art. It should not be left to the skilled reader to find out how to exploit the invention by carrying out a research programme.

Accordingly, a product whose structure was given (e.g. a nucleic acid sequence) but whose function was undetermined or obscure or only vaguely indicated might not fulfil the above criteria, in spite of the fact that the structure of the product per se could be reproduced (made) (see T 870/04). If a patent was granted, it might prevent further research in that area. On the other hand, a product which was definitely described and plausibly shown to be usable, e.g. to cure a rare or orphan disease, might be considered to have a **profitable** use or concrete benefit, irrespective of whether it was actually intended for the pursuit of any trade at all.

In T 1450/07 the board referred to the principles established in T 898/05 that industrial applicability is acceptable if the disclosure in the application as filed on the function of a claimed compound (i) is plausible to the skilled person, (ii) is later confirmed by post-published evidence, and (iii) provides a clear basis for an industrial application.

In T 870/04 the board stated that a "practical" application of the invention had to be disclosed. Merely because a substance could be produced in some ways did not necessarily mean that this requirement was fulfilled, unless there was also some profitable use for which the substance could be employed.

The board noted that biotechnological inventions were quite often concerned with substances found in nature (e.g. a protein, a DNA sequence, etc.). If a function was well known to be essential for human health, then the identification of the substance having this function would immediately suggest a practical application in the case of a disease or condition caused by a deficiency, as was the case, for example, for insulin, human growth hormone or erythropoietin. In such cases, an adequate description would ensure that "the invention can be made or used in industry". In cases where a substance, naturally occurring in the human body, was identified, and possibly also structurally characterised and made available through some method, but either its function was not known or it was complex and incompletely understood; no disease or condition had yet been identified as being attributable to an excess or deficiency of the substance; and no other practical use was suggested for the substance, then industrial applicability could not be acknowledged. Even though research results may be a scientific achievement of considerable merit, they are not necessarily an invention which can be applied industrially.

In cases T 338/00 and T 604/04 the boards found the inventions industrially applicable despite the absence of actual experimental data, because a profitable use could readily be identified on the basis of the description, taking into account common general knowledge. Thus each case is decided on its own merits according to the particular

technical circumstances, including extent of disclosure, background art and post-published evidence.

In T. 641/05 the board considered that no actual information regarding the function of the CEGPCR1a clone at any of the three particular levels of function referred to in decision T. 898/05, i.e. molecular, cellular and biological function in a broad sense (binding of a ligand, propagation of a transmembrane signal, role in a transduction signal pathway and/or in a network of interconnected pathways of a multicellular organism), could be directly derived from the application itself or from the prior art on file. Although, under certain conditions, the board was well prepared – following the case-by-case approach adopted in decision T. 898/05 – to acknowledge a possible function based on computer-assisted methods, in the case before it the probative value of these (sequence homology) methods was completely lacking. In the absence of this functional information, no "immediate concrete benefit" in the sense defined in decision T. 898/05 could be recognised for the CEGPCR1a clone disclosed in the application.

In T. 1452/06 the board commented that the basis for all the therapeutic indications of the claimed subject-matter was the predicted role of the purported serine protease activity of the polypeptide of sequence SEQ ID NO: 24 in the degradation of the extracellular matrix. No experimental evidence whatsoever was present in the application in support of a serine protease activity for a polypeptide comprising the amino acid sequence of SEQ ID NO: 24. There was no example disclosing this serine protease activity, nor any evidence showing that the screening methods and the therapeutic indications based on this serine protease activity could actually be achieved with a polypeptide of sequence SEQ ID NO: 24. The only use of a polypeptide of sequence SEQ ID NO: 24 was to find out more about the polypeptide itself and its natural function(s); this was a speculative outcome and therefore provided no "immediate concrete benefit" (T. 898/05, T. 870/04).

II. PATENT APPLICATION AND AMENDMENTS

A. Claims

1.	Basic principles	282
1.1.	Purpose of claims under Article 84 EPC	282
1.2.	Types of claim	282
1.3.	Technical features	283
1.4.	The examination of clarity in opposition proceedings	283
1.5.	Clarity of claims and Article 83 EPC	283
2.	Form, content and conciseness of claims	283
2.1.	Form of claims: Rule 43(1) EPC	284
2.1.1	One-part or two-part claim	284
2.1.2	Two-part claims: preamble and characterising portion	285
2.2.	More than one independent claim per category: Rule 43(2) EPC	285
2.2.1	Conditions	286
2.2.2	Burden of proof	287
2.2.3	No applicability in opposition proceedings	288
2.3.	Conciseness and number of claims	288
2.4.	Reference to the description or drawings: Rule 43(6) EPC	289
3.	Clarity of claims	289
3.1.	Introduction and general principles	289
3.2.	Indication of all essential features	292
3.3.	Clarity of broad claims	295
3.4.	Functional features	296
3.5.	Characterisation of an invention by a parameter	298
3.6.	Unspecified features and relative qualities	300
3.7.	Principles in connection with categories of claim	302

5.	Claims supported by the description	303
5.1.	General principles	303
5.2.	Restrictions on generalising the technical information and examples adduced in the description	304
5.3.	Bringing the description into line with amended claims	306
6.	Interpretation of claims	307
6.1.	General principles	307
6.2.	Meaning of terms and phrases: "comprising (substantially)", "consisting (essentially) of", "containing"	308
6.3.	Using description and drawings to interpret the claims	309
6.3.1	General principles	309
6.3.2	Relevance of Article 69 EPC	310
6.3.3	Interpretation of ambiguous terms or confirmation of the text of a claim	311
6.3.4	Reading additional features and limitations into the claims	312
6.3.5	Use in the examination relating to the clarity requirement pursuant to Article 84 EPC	313
6.3.6	Definition of the scope of protection with regard to infringement not within the EPO's competences	315

7.	Product-by-process claims	315
7.1.	Introduction	315
7.2.	Requirement that the claimed product must be patentable	316
7.3.	Requirement that the claimed product cannot be described in any other way	318
7.4.	Applicability of the principles for product-by-process claims to use claims	318
7.5.	Combination of product and process features	319
7.6.	Extension of protection conferred by product-by-process claims	319
8.	Claims fees	319
8.1.	Number of claims	320
8.2.	Temporary change in the number of claims	320
8.3.	No refund of claims fees	321

1. Basic principles

1.1. Purpose of claims under Article 84 EPC

Art. 84 EPC provides that claims must define the matter for which protection is sought. It lays down the relevant principles governing the content and wording of the claims, providing that claims should be clear and concise and be supported by the description. It is supplemented by R. 43 EPC.

In G 2/88 (OJ 1990, 93, Corr. 469) the Enlarged Board stated that the primary aim of the wording used in a claim must be to satisfy the requirements under Art. 84 and R. 29(1) EPC 1973 (R. 43(1) EPC), having regard to the particular nature of the invention, and the purpose of the claims. The purpose of claims under the EPC is to enable the protection conferred by the patent or patent application to be determined (Art. 69 EPC), and thus the rights of the patent owner within the designated contracting states (Art. 64 EPC), having regard to the patentability requirements of Art. 52 to 57 EPC.

The boards of appeal have repeatedly confirmed that claims must be clear for the sake of legal certainty, as their purpose is to enable the protection conferred by the patent to be determined (see e.g. T 337/95, OJ 1996, 628; T 586/97; T 437/98; T 728/98, OJ 2001, 319; T 1074/00; T 560/09; T 754/13: "constant jurisprudence"; T 129/13). Legal certainty is of paramount importance in any system where the rights of the public are affected by the grant of a monopoly (T 81/14). The public should not be left in any doubt as to which subject-matter is covered and which is not (T 2086/11). The skilled person should be able to establish the demarcation of the scope of the claim (i.e. its extent of protection) without undue burden (T 754/13).

1.2. Types of claim

The Enlarged Board set out in G 2/88 that there are basically two different types of claim, namely a claim to a physical entity (e.g. product, apparatus) and a claim to a physical activity (e.g. method, process, use). These two basic types of claim are sometimes referred to as the two possible "categories" of claim. Within the above two basic types of

claim various sub-classes are possible (e.g. a compound, a composition, a machine; or a manufacturing method, a process of producing a compound, a method of testing, etc.). Furthermore, claims including both features relating to physical activities and features relating to physical entities are also possible. There are no rigid lines of demarcation between the various possible forms of claim.

1.3. Technical features

Under the EPC the claims must define the matter for which protection is sought "in terms of the technical features of the invention" (R. 43(1) EPC). In G 2/88 the Enlarged Board described the technical features of the invention as being the physical features which are essential to it. The technical features of a claim to a physical entity are the physical parameters of the entity, and the technical features of a claim to an activity are the physical steps which define such activity. The Enlarged Board also pointed out, however, that the boards of appeal had in a number of cases allowed the technical features to be defined functionally in certain instances. See in this chapter II.A.3.4.

1.4. The examination of clarity in opposition proceedings

Art. 84 EPC is not a ground for opposition. However, when substantive amendments are made to a patent during an opposition, consideration has to be given to whether the amendments introduce any contravention of any requirement of the EPC, including Art. 84 EPC (T 301/87, OJ 1990, 335). In G 3/14 (applied inter alia in T 1977/13, T 1905/13, T 565/11, T 248/13, T 1287/14, T 2311/15, T 2321/15) the Enlarged Board analysed whether, and if so to what extent, the requirements of Art. 84 EPC may be examined in opposition and opposition appeal proceedings, in particular if the amended claim is a mere combination of a granted independent claim and granted dependent claims or elements thereof. The Enlarged Board approved T 301/87 and held that, for the purposes of Art. 101(3) EPC, the claims may be examined for compliance with Art. 84 EPC only when, and then only to the extent that the amendment introduces non-compliance with Art. 84 EPC (see chapter IV.C.5.2.2 "Extent of power to examine amended claims for compliance with Article 84 EPC").

1.5. Clarity of claims and Article 83 EPC

Art. 83 EPC requires that the European patent application discloses the invention in a manner sufficiently clear and complete for it to be carried out by a person skilled in the art. In certain circumstances, for example when undefined parameters are used in the claims and no details of the measuring methods are supplied, the question arises whether there is a problem with respect to Art. 83 or Art. 84 EPC. The answer is important, because Art. 83 EPC is a ground for opposition, whereas Art. 84 EPC is not. See chapter II.C.8. "The relationship between Article 83 and Article 84".

2. Form, content and conciseness of claims

R. 43 EPC concerns the form and content of claims. Apart from the requirement that the claims define the matter for which protection is sought in terms of the technical features of

the invention it concerns the following issues which are the subject of this sub-chapter: the two-part form of claims, the exceptions to the general rule that the application may contain no more than one independent claim in the same category, the reasonable number of claims and the provision that claims should normally not rely on references to the description and drawings in specifying the technical features of the invention. R. 43 EPC has also been discussed in the context of clarity of claims (see in this chapter II.A.3.7.).

2.1. Form of claims: Rule 43(1) EPC

R. 43(1)(a) and (b) EPC (like R. 29(1)(a) and (b) EPC 1973) define the two-part form which a claim is to have where this is appropriate. Such claims must contain a statement indicating the designation of the subject-matter of the invention and those technical features which are necessary for the definition of the claimed subject-matter but which, in combination, form part of the prior art ("preamble"), and a characterising portion stating the technical features for which, in combination with the features stated in the first part, protection is sought. See also Guidelines F-IV, 2 – November 2018 version.

2.1.1 One-part or two-part claim

In T. 13/84 (OJ 1986, 253), the board ruled that a claim in two-part form had to be regarded as appropriate if a clearly defined state of the art existed from which the claimed subject-matter distinguished itself by further technical features (likewise T. 181/95). This was confirmed by T. 162/82 (OJ 1987, 533), where the board added that the extent to which prior art was cited in the description could not determine whether the one-part or the two-part form of a claim was appropriate in a given case.

In T. 170/84 (OJ 1986, 400) it was pointed out that where a two-part claim would lead to a complex formulation it was no longer appropriate. In a one-part claim, the features required for the definition which belonged to the state of the art had to be sufficiently clear from the description. This principle has been upheld inter alia in T. 269/84, T. 120/86, T. 137/86 and T. 278/86. The latter two decisions stipulated that a two-part claim was not justified if it gave an incorrect picture of the state of the art (likewise T. 181/95). In T. 735/89 the board did not accept a one-part claim because it gave the impression that there was no closer state of the art.

In T. 99/85 (OJ 1987, 413) the board held that in opposition proceedings there was no reason officially to insist on a change in the wording of the claim simply because one feature in the preamble to a two-part claim did not belong to the state of the art. Furthermore, the board saw R. 29(1) EPC 1973 as an implementing regulation which did not constitute a ground for opposition. A similar view was held in T. 168/85, T. 4/87, T. 429/88, T. 65/89.

In T. 350/93 the patent application disclosed processes for the production of electro-active material and composite materials containing such material and included claims in one-part form. The board observed that the one-part form was justified because details in certain process steps distinguished the claimed processes from those in the prior art and the distinctive features were difficult to pick out in a simple and unambiguous form.

In T.121/06 the board found that the combination of features in claim 1 was not known from the prior art. It would thus be detrimental to the logic of the claim to split up its features (i) to (iii) into their basic building blocks merely to indicate which blocks happen to be known from the prior art, without having regard to their inter-relationships. Thus, the two-part form of the claim was found to be inappropriate (R.29(1)EPC.1973).

For further instances in which a claim in two-part form was not regarded as appropriate, see inter alia T.345/89, T.378/92, T.723/93 and T.181/95.

2.1.2 Two-part claims: preamble and characterising portion

Which features are known and hence to be included in the preamble has to be decided in the light of the objective facts of the case (T.6/81, OJ 1982, 183).

In T.13/84 (OJ 1986, 253) the board considered it could not be accepted as a general rule that the piece of prior art used for the preamble of the claim should be concerned with the same problem as the invention (likewise T.287/02). Generally, the apparatus or process constituting the prior art which was nearest to the invention would have to figure in the preamble of the claim, stating such features of it as were necessary for the definition of the claimed subject-matter and which were in combination already part of this prior art (see also T.897/90). R.29 EPC 1973 (like R.43 EPC) made no reference to the necessity or desirability that the characterising portion of the claim should fairly set out the inventive step. It was the subject-matter of the claim as a whole which embodied the invention and the inventive step involved. See also T.886/91, T.157/93.

T.850/90 confirmed that examination for inventive step should also take account of the features in the preamble, since the invention was defined by the claims as a whole. Likewise, in T.980/95 it was held that there was no explicit requirement in R.29(1)(a)EPC.1973 that a claim in two-part form be set up on the basis of the "closest" prior art, since the rule made no reference to the necessity or desirability for the characterising portion of the claim to set out the inventive step. Basing the two-part form on a particular state of the art which later turned out not to be the "closest" state of the art for the assessment of inventive step did not in itself contravene R.29(1)(a)EPC.1973.

In decision T.688/91 (discussed in this chapter II.A.3.3.) the board took the view that there was a breach of R.29 and Art.84 EPC 1973 where an incorrect distinction was made between the preamble and the characterising portion (likewise T.181/95).

2.2. More than one independent claim per category: Rule 43(2) EPC

R.29(2)EPC.1973 was amended with effect from 1 January 2002. Prior to this date it permitted an application to contain two or more independent claims in the same category where it was "not appropriate" to cover the subject matter by a single claim. The amended version of R.29(2)EPC.1973 specified that an application may contain more than one independent claim in the same category (product, process, apparatus or use) only if the subject-matter involves (a) a plurality of interrelated products, (b) different uses of a

product or apparatus or (c) alternative solutions to a particular problem, where it is inappropriate to cover these alternatives by a single claim.

The case law below relates to the amended version of R. 29(2) EPC 1973 (corresponding to R. 43(2) EPC), which is not applicable in opposition proceedings (see in this chapter II.A.2.2.3).

2.2.1 Conditions

In case T 56/01, each of the appellant's requests in the appeal stage contained three independent claims of the same category: one claim to a broadband communications module and two claims to a signal transport system. Hence, the board had to discuss compliance with R. 29(2) EPC 1973. The board concluded from the preparatory documents that condition (a), in spite of the distinction made between products and apparatus in the opening part of the Rule, also applied to apparatus claims. Nevertheless, the board did not consider that condition (a) was met by the two claims for the signal transport system because they were not interrelated. The board inferred from the examples in an early proposal to the Administrative Council for the amendment of R. 29(2) EPC 1973 that interrelated products were meant to be different objects that complement each other, or somehow work together. Moreover, the board defined the "alternative solutions" under R. 29(2)(c) EPC 1973 as different or even mutually exclusive possibilities. Moreover, even alternative solutions were only allowed under the condition that "it is not appropriate to cover these alternatives by a single claim". The board concluded from the preparatory documents that "not appropriate" meant "not possible or not practical". The intention was that, if it was possible to cover alternative solutions by a single claim, then the applicant should do so.

In T 659/03 the board had to decide whether the two contentious independent claims in the same category were covered by the exception in R. 29(2)(c) EPC 1973. The board held, first of all, that the appellant's wish to protect the two alternative processes by two independent process claims was justified. It then confirmed that there were alternative solutions to a particular problem, since the independent claims each contained all the features required to solve the problem addressed.

In T 525/03 the board also found that there were alternative solutions and held that it would not appear appropriate to cover those alternative solutions in a single independent claim. Rather, attempting to redefine the subject-matter of these claims in a more generalising way in one independent claim might lead to an objection under Art. 123(2) EPC 1973. Such generalisation could furthermore be problematic under Art. 87 EPC 1973. In T 895/05 too the board found that the requirements of R. 29(2)(c) EPC 1973 were satisfied.

In T 2355/11 the board interpreted R. 29(2)(c) EPC 1973. In its view, it was appropriate for the application to have three independent process claims because a single claim bringing together all the process steps could entail a breach of Art. 83 EPC 1973. Besides, a single claim of this kind could give rise to objections under Art. 84 EPC 1973 because the essential features defining the sequencing of the steps in the process would be lost.

The board concluded that it was possible but not practical to replace the three independent claims with a single claim.

In T. 671/06 the board found that a claim to a system comprising a power source (specified in broad functional terms) and claims to power sources (specified in structural terms) for that system did not fall under the exception in R. 29(2)(a) EPC 1973. It could be deduced from the examples provided in the Guidelines that inter-related products were, on the one hand, products which, although existing independently from each other as stand-alone products, only performed the invention when interacting with each other (e.g. plug and socket, transmitter – receiver), and, on the other hand, chemical products which were derived from their predecessors (i.e. intermediate(s) and final chemical product, gene – gene construct – host – protein – medicament). In contrast, the claimed system and the claimed power sources did not interact with each other, as the claimed system was completely self-contained in performing the invention. The board concluded that the term "inter-related products" in R. 29(2) EPC 1973 did not extend to a system which is self-contained in performing the invention and a product which is a constitutive substituent part for that system. The board did not follow T. 133/02, which had held that a system claim and a means claim relating to a component of the system were directed to inter-related products, similar to a plug and a connection system combining the plug with an adapted socket. In T. 671/06 the board argued that a claim directed to a connection system comprising the plug would be dependent on the claim to the plug, as it necessarily comprised all the features of the plug. However, R. 29(2) EPC 1973 was not intended to permit or prohibit claims which were permitted under R. 29(4) EPC 1973. The scope of application of these rules should be kept separate.

Likewise in T. 1232/07 the board, discussing the exceptions laid down in R. 29(2) EPC 1973, highlighted that exception (a) referred only to interrelated products and not to some kind of interrelationship between the subject-matter of independent claims. Such products were, on the one hand, objects which although existing independently of each other as stand-alone products only performed the distributed invention when interacting with each other (e.g. lock and key) and, on the other hand, chemical compounds derived from their precursors. Moreover, the board pointed out that exception (b) referred to different uses of a product or apparatus and not to different uses of a concept as argued by the appellant (applicant).

2.2.2 Burden of proof

In T. 56/01 the board emphasised that, when an objection under R. 29(2) EPC 1973 arose, the burden of proof was shifted onto the applicant, i.e. it was up to the applicant to argue convincingly why additional independent claims could be maintained. Likewise the board in T. 1388/10 stressed that the onus of setting out and proving the case for the application of an exception (in this case, an exception under R. 43(2) EPC) lay with the party seeking to rely on that exception. Thus, an applicant wanting more than one independent claim in the same category must, if the examining division objects, convincingly demonstrate that all the additional independent claims fall under one of the exceptions provided for in R. 43(2) EPC.

2.2.3 No applicability in opposition proceedings

In T 263/05 (OJ 2008, 329) the board considered whether R. 29(2) EPC 1973 (R. 43(2) EPC) applied in opposition proceedings by virtue of the reference in R. 61a EPC 1973. The board reviewed decision G 1/91 (OJ 1992, 253), which had considered the effect of R. 61a EPC 1973 in the context of the requirement of unity. The Enlarged Board had taken the view that the reference to Chapter II was only a general one and that R. 61a EPC 1973 could only be taken to refer "to those requirements which would still be reasonable to demand of the new documents relating to the amended patent". The board in T 263/05 concluded that R. 29(2) EPC 1973 did not apply in opposition proceedings to prohibit an amendment to a granted patent if it would be unreasonable to demand of the amended claims that they comply with this rule. This condition was satisfied in a case where otherwise R. 29(2) EPC 1973 would force the patent proprietor to abandon potentially valid subject matter already contained in the granted claims. Once an amendment to the claims had been established to be necessary and appropriate having regard to the grounds of opposition, it would be unreasonable to impose the additional requirement that the amendment complied with the purely administrative provisions of R. 29(2) EPC 1973 (see also T 987/05; T 1242/06, OJ 2013, 42; T 85/08). For example it is, in principle, possible in opposition proceedings to replace an independent claim as granted by two independent claims directed to specific embodiments covered by the independent claim as granted (see T 223/97, T 428/12 and chapter IV.C.5.1.5 b) "Filing new independent claims").

2.3. Conciseness and number of claims

Whilst R. 43(2) EPC provides for a restriction in the number of independent claims per category, there is no equivalent limit on the number of dependent claims or claims concerning a particular embodiment of an invention (R. 43(3) and (4) EPC). R. 43(5) EPC provides that the number of claims shall be reasonable with regard to the nature of the invention claimed.

Pursuant to Art. 84 EPC claims must not only be clear, but also concise. In a number of cases this has been interpreted as requiring claims to be concise both individually and in their entirety (see e.g. T 79/91, T 246/91). The examination of these requirements depends on the specific facts of the case (see also T 596/97, T 993/07).

A Markush formula is the most concise means of defining a class of chemical compounds in a claim (T 1020/98). The examining division had held that "formulating claims in a style that makes routine tasks in substantive examination unnecessarily difficult" was a contravention of Art. 84 EPC 1973. However, there is no legal basis in the EPC for a request to restrict the content of an independent claim so that substantive examination can be carried out with greater ease and less effort.

Regarding lack of conciseness because of a superfluous claim, see e.g. T 988/02.

In T. 1882/12 the board pointed out that R. 43(3) EPC neither prohibited including optional features in a claim nor made it mandatory to draft a separate dependent claim for each particular embodiment to be cited in the claims.

2.4. Reference to the description or drawings: Rule 43(6) EPC

Pursuant to R. 43(6) EPC claims shall not rely, "except where absolutely necessary", on references to the description or drawings in specifying the technical features of the invention. Expressions such as "as described in part...of the description", or "as illustrated in figure...of the drawings" are to be avoided.

In T. 150/82 (OJ 1984, 309) the board ruled that claims relying on references to the description in the specification in respect of all their technical features (so called "omnibus claims") were unallowable as contrary to R. 29(4) and R. 29(6) EPC 1973 (R. 43(4) and (6) EPC), unless absolutely necessary, e.g. when a plurality of conditions would not lend themselves to verbal expression without such a reference. Examples of such exceptions included inventions containing features or limitations which could only be expressed by means of drawings or graphs defining a particular shape or a plurality of conditions. In T. 271/88 the board upheld T. 150/82 and decided that it was not possible to base claims on an appendix showing structural chemical formulae designated as "chemical formulae incorporated within claims". The board held that it was quite evident that the terms "description" and "drawing" in R. 29(6) EPC 1973 were meant to cover structural chemical formulae. See also T. 752/94.

In T. 1156/01 the board considered that, if the invention was characterised by parameters, the method of and means for measurement should appear completely in the claim itself, whenever this was reasonable, or by reference to the description in accordance with R. 29(6) EPC 1973, if the method was so long that it would impair the conciseness of the claim (confirmed in T. 796/01).

In T. 237/84 (OJ 1987, 309) the board stated that the purpose of reference signs in a claim (R. 29(7) EPC 1973) was to make the claims easier to understand. They did not limit the scope of the claim but did affect its clarity and might enable it to be expressed more concisely than would otherwise be possible (confirmed e.g. in T. 572/90). In T. 986/97 the board allowed a reference to the drawings.

In decision T. 816/90 plasmids were defined by use of a designation which had no technical meaning per se. Moreover, their structure was defined by reference to a figure. The board was of the opinion that such a definition of a plasmid was contrary to the requirements of Art. 84 EPC 1973 and therefore could not be accepted.

3. Clarity of claims

3.1. Introduction and general principles

Claims lack clarity if the exact distinctions which delimit the scope of protection cannot be learnt from them (T. 165/84, T. 6/01). The claims per se must be free of contradiction

(see T. 2/80, OJ 1981, 431). They must be clear in themselves when read by the person skilled in the art, without any reference to the content of the description (T. 2/80; T. 1129/97, OJ 2001, 273; T. 2006/09; T. 1253/11; T. 355/14). The Enlarged Board held in G 1/04 (OJ 2006, 334) that the meaning of the essential features should be clear for the person skilled in the art from the wording of the claim alone (see also T. 342/03, T. 2091/11, T. 630/14, T. 1140/14, T. 1957/14). The description is taken into account for the purposes of interpreting the claims and has in some cases also been considered when determining clarity and conciseness (see in this chapter II.A.6.3.).

In the key decision T. 728/98 (OJ 2001, 319) the board held that it followed from the requirement of legal certainty that a claim could not be considered clear within the meaning of Art. 84 EPC 1973 if it comprised an unclear technical feature (here "substantially pure") for which no unequivocal generally accepted meaning existed in the relevant art. This applied all the more if the unclear feature was essential for delimiting the subject-matter claimed from the prior art (see also T. 1399/11). Likewise in T. 226/98 (OJ 2002, 498) the board held that the feature "as a pharmaceutical product" for defining a pharmaceutical standard of purity in a claim related to a product as such (here, famotidine form "B"), rendered said claim unclear in the absence of a generally accepted quantitative definition for the purported standard of purity.

In T. 586/97 the main claim was directed to an aerosol composition comprising a propellant and an active ingredient which was not defined. The board held that, when an essential ingredient comprised in a chemical composition is open to be labelled arbitrarily "active ingredient" or not, the meaning of that feature would be variable. Leaving the public in doubt as to which compositions are covered by the claim would be at variance with the principle of legal certainty. Therefore, the claim at issue failed to meet the requirement of clarity imposed by Art. 84 EPC 1973. See also T. 642/05, T. 134/10.

In T. 1045/92 the claims concerned "a two-pack type curable composition comprising [...]". In the board's view "a two-pack curable composition" was an item of commerce as familiar to readers skilled in the polymer art as everyday articles were to the public at large. The claim was therefore clear.

In decisions T. 1129/97 (OJ 2001, 273) and T. 274/98 the board emphasised that, to satisfy the clarity requirement, the group of compounds/ingredients according to the claim had to be defined in such a way that the skilled person could clearly distinguish compounds/ingredients that belonged to the claimed group from those that did not (see also T. 425/98 regarding the expression "consisting of a major amount of").

In T. 268/13 the board concluded that a claim to a "method for producing a [...] decorative strip having a [...] structure consisting of a text or graphic symbol [...]" satisfied the requirements of Art. 84 EPC 1973. Although it was impossible to give an entirely general, universally applicable definition of what constituted a symbol, in the case in hand it would be clear whether or not a particular character was a symbol in the given cultural, linguistic or technical context. The claim therefore presented neither somebody wanting to avoid infringing the patent nor a court deciding on infringement with an impossible task.

In T.1957/14 the board was not persuaded by the appellant's argument that deposited material serves as a surrogate for the description of a sequence, i.e. as an alternative to structural information. In the board's opinion, relying on deposited inbred line material for the definition of the essential features of the invention and requiring it to be analysed in order to identify the relevant alleles was at odds with the principle that, generally, the meaning of a claim, including its essential features, should be clear for the person skilled in the art from the wording of the claim alone.

In T.1845/11 the board concluded that the term "Asian race" was not clear. Clearly defined objective criteria for patient assignment into racial groups were not available to the skilled person.

In T.651/05 the board found that the introduction of vague terms created a lack of clarity due to different but equally valid interpretations (see also T.621/03, T.127/04). In T.1534/10 a claim contained the feature "that the data carrier (1) is constructed in a multi-layered manner as a laminate and contains at least two films (4, 5) which are integrated as a cover film (4) or as a core film (5) into the layer construction of the laminated data carrier". The board considered this wording ambiguous because it combined a plural form ("at least two films (4, 5)") with a singular form ("as a cover film (4) or as a core film (5)"), making it unclear whether the "at least two films" were each either a cover film or a core film, or whether together they formed a new film that was then either a cover film or a core film.

Where, on one of several possible constructions of a vaguely formulated claim, part of the subject-matter claimed is not sufficiently described to be carried out, the claim is open to objection under Art. 100(b) EPC 1973 (T.1404/05, see also chapter II.C.8.1. "Art. 83 EPC and support from the description").

In T.762/90 a lack of clarity was found in the use of a trade mark designating a whole series of products which differed from one another depending on phases in their industrial development. Moreover, the board expressed doubts about the use of such a designation, since it was uncertain whether the meaning of the trade mark would remain unaltered up to the end of the patent term (see also T.939/92, T.270/11; see also chapter II.E.1.7.3.e) "Drafting of disclaimers – clarity"). Similarly, in T.480/98 the board considered that a trade mark product referred to in the characterising portion of claim 1 did not have a clear technical meaning, in that it could refer to a plurality of products having different compositions and properties. In consequence there was a lack of clarity, and the claim was not allowable. According to the board in T.623/91 the exclusion of a composition by reference to the trade mark or trade designation would not introduce uncertainty and therefore not offend against Art. 84 EPC 1973, as changes in the range of chemical composition would not be likely without a corresponding change in the trade name or trade mark.

The preamble of claim 2 of the application in T.363/99 contained a reference to a German patent specification. The board considered this to be a violation of Art. 84, second sentence, EPC 1973 since it was impossible to establish the scope of the matter for which protection was sought without consulting the reference document mentioned. The fact that

the indication of the publication number of the reference document provided the most concise definition of the matter for which protection was sought (Art. 84 EPC 1973) was irrelevant by comparison. When formulating a patent claim, the form that was objectively more precise always had to be chosen (T. 68/85, OJ 1987, 228).

Complexity as such is not equivalent to a lack of clarity – clarity under Art. 84 EPC is not at stake in a case of mere complexity of a claim provided the subject-matter for which the protection is sought and the scope thereof are clear and unambiguous for a person skilled in the art, either per se or in the light of the description (see T. 574/96 re Art. 84 EPC 1973). In T. 1020/98 (OJ 2003, 533) the board confirmed that compliance with the clarity requirement of Art. 84 EPC 1973 was not dependent on the time required to establish whether a given compound was covered by the product claim. The clarity requirement was not a basis for objecting to the complexity of a claim. Clarity within the meaning of that article merely required the claims to define the subject-matter for which protection was sought clearly and unambiguously for the skilled person, if necessary in the light of the description.

In T. 75/09 the board held that where higher ranking requests are refused because a feature common to all requests does not meet the requirements of Art. 84 EPC, all lower ranking requests retaining this feature have to be refused for the same reason.

3.2. Indication of all essential features

According to the established case law of the boards of appeal Art. 84 EPC has to be interpreted as meaning not only that a claim must be comprehensible from a technical point of view, but also that it must define the object of the invention clearly, that is to say indicate all the essential features thereof. An independent claim should explicitly specify all essential features needed to define the invention (G. 1/04, OJ 2006, 334). All features which are necessary for solving the technical problem with which the application is concerned have to be regarded as essential features; see on this issue T. 32/82 (OJ 1984, 354) and T. 115/83, confirmed inter alia in T. 269/87, T. 409/91 (OJ 1994, 653), T. 694/92 (OJ 1997, 408), T. 1055/92 (OJ 1995, 214), T. 61/94, T. 488/96, T. 203/98, T. 260/01, T. 813/03, T. 1540/12, T. 2427/13, T. 1180/14, T. 30/16. The indication of all essential features is seen as necessary to meeting the clarity requirement.

The board's opinion in T. 32/82 was also confirmed in T. 622/90, where it was held that lack of clarity could be caused not only by the presence of an ambiguous feature, but also by the absence of a feature which was necessary for clarity. See also T. 630/93.

The essential features should in particular comprise those which distinguish the invention from the prior art (T. 1055/92, OJ 1995, 214; T. 813/03). Regarding the delimitation of essential from non-essential features, see also T. 61/94, T. 203/98, T. 141/00, T. 260/01, T. 1573/12, T. 2131/12.

According to the board in T. 888/07, if from the wording of an independent claim it must be concluded that a solution of the problem of the invention is achieved by not needing a step, whereas this very feature according to the description cannot be abolished, but is

necessary for a workable solution, then such a feature is to be considered an essential feature of the invention. An independent claim missing this feature is therefore neither clear, nor supported by the description. See also in this chapter [II.A.5.](#)

In [T 809/12](#) the board stated that, if an independent claim contained a feature defined by a result to be achieved which essentially corresponded to the problem underlying the application, to comply with [Art. 84 EPC 1973](#) the remaining features of the claim had to comprise all essential features necessary for achieving that result. See also [T 2427/13](#).

According to the board in [T 818/03](#) a method claim which does not state sufficiently clearly the steps by which a particular result was achieved might still be considered clear provided the result to be achieved was clearly defined. A claim which defines a method of achieving some less than clearly defined result might also still be considered clear provided the steps that need to be taken to achieve that result are sufficiently clearly defined. However, a claim must be considered to lack clarity if, as here, it sets out insufficiently clearly both the necessary parameters of the method and the relevant characteristic features of the result.

In [T 409/91](#) the invention related to fuel oils. In the description the use of certain additives was presented as an essential constituent of the fuel oil composition. As this feature was missing in the claims, the board found that they defined some other invention which was not sufficiently disclosed. Although the requirements of sufficient disclosure of the invention ([Art. 83 EPC](#)) and support by the description ([Art. 84 EPC](#)) were related to different parts of the patent application, they gave effect to the same legal principle that the extent of a patent monopoly, as defined by the claims, should correspond to the technical contribution to the art (see also chapter [II.C.8.](#) "The relationship between [Article 83](#) and [Article 84](#)"). In [T 30/16](#) the board held that the technical contribution of an invention did not lie in the fact that the problem was solved, but rather in the combination of features by which it was solved.

In [T 2001/12](#) the board held that, if doubt that the invention as claimed is capable of solving the problem defined in the application arises because the claim fails to specify those features which are disclosed in the application as providing the solution to the problem, then the description and claims are inconsistent in relation to the definition of the invention, and an objection under [Art. 84 EPC 1973](#) may properly arise that the claims do not contain all the essential features necessary to specify the invention (see also chapter [II.C.6.](#) "Reproducibility"). See also [T 1180/14](#).

In [T 1055/92](#) the board stated that since the primary function of a claim was to set out the scope of protection sought for an invention, it was not always necessary for a claim to identify technical features or steps in detail. This primary function of the claims should be clearly distinguished from the requirement that the European patent application had to disclose the invention in such a way that it enabled a person skilled in the art to carry out that same invention. Under [Art. 83 EPC 1973](#) sufficient disclosure was required of a European patent application but not of an individual claim as such. A claim had to comprise the essential features of the invention; the essential features should in particular comprise those features which distinguished the invention from the closest prior art. See also [T 61/94](#).

In **T.914/02** the appellant sought to derive from the alleged sheer complexity of the proposed solution an implied use of technical means, in particular a computer. According to the board, it was doubtful as a matter of principle whether complexity could be used to disqualify an activity as a mental activity (see also chapter **I.A.1.4.2** "Technical considerations and technical implementations"). Rather, it would appear generally that if computer means were indeed indispensable, they should be included in the claim as an essential feature of the invention.

G.1/04 (OJ 2006, 334) concerned **diagnostic methods**. The Enlarged Board held that a diagnostic method within the meaning of **Art. 52(4) EPC 1973** had an inherent and inescapable multi-step nature. If diagnosis as the deductive medical or veterinary decision phase was a purely intellectual exercise, the feature pertaining to the diagnosis for curative purposes and the features relating to the preceding steps which were constitutive for making the diagnosis represented the essential features of a diagnostic method within the meaning of **Art. 52(4) EPC 1973**. Thus, in order to satisfy the requirements of **Art. 84 EPC 1973**, an independent claim relating to such a method must include these features. The Enlarged Board further held that, while essential features were for the most part of a technical nature, a non-technical feature constitutive for defining the invention must likewise be included as an essential feature in the independent claim. Thus, although diagnosis *stricto sensu* was a purely intellectual exercise unless it was carried out by a device, the feature pertaining to it was such an essential feature as to be included in the independent claim. See also chapter **I.B.4.5.1.d**) "Clarity of a claim relating to diagnostic methods".

G.1/07 (OJ 2011, 134) concerned **surgical methods**. The Enlarged Board referred to **G.1/04** and stated that a claim should explicitly specify all essential features and must be clear. Under **Art. 84 EPC**, whether or not a step being or encompassing a surgical step excluded from patentability can be omitted either by using positive wording for such omission like "pre-delivered" or by simply leaving it out from the claim depends on whether the claimed invention is fully and completely defined by the features of the claim without that step. See also chapter **I.B.4.3.4.b**) "Surgical step part of claimed method?".

In **T.2102/12** the application related to medical robotic systems which allow to robotically move a tool on an articulated arm in response to the surgeon's manipulation of an input device. The board referred to **G.1/07** and held that claiming the measurement of the movement of the tool while "unclaiming" the movement itself rendered the claim unclear under **Art. 84 EPC**. The claimed method of intertwined non-surgical ("claimed") and surgical ("unclaimed") steps was not comparable to that underlying **T.836/08**.

In decision **T.923/08** the board decided as follows: If a method for recording measurements on the human or animal body necessarily entails a surgical step in order to fix to the human or animal body a measuring device which is indispensable for performing the method, this step has to be deemed an essential feature of the method and is comprised in such a method, even if the claim contains no method feature explicitly directed to it. Such a method is excluded from patentability under **Art. 53(c) EPC**. The exclusion of such a surgical step, whether by stating that the surgically attached measuring device was already fixed to the body before the start of the method or whether by use of

a disclaimer, breaches Art. 84 EPC 1973 because such a process claim does not then include all the essential features of the claimed invention.

3.3. Clarity of broad claims

It was established in T. 238/88 (OJ 1992, 709) that the clarity of a claim is not diminished by the mere breadth of a term of art (e.g. "alkyl") contained in it, if the meaning of such term – either per se or in the light of the description – is unambiguous for a person skilled in the art (see also T. 950/97, T. 103/00, T. 1173/03, T. 2068/10, T. 745/11; see also in this chapter II.A.6.).

In T. 523/91 the board held that the wording "plastics in combination with inserts" and "this insert is combined with the plastics granules in a wound or folded manner" did not cause the subject-matter of the claim to be unclear within the meaning of Art. 84 EPC 1973. Although the nature of the combination covered many possibilities, the resulting subject-matter of the claim was broad rather than unclear. The broadness of a claim could not be contested on its own but only in conjunction with other criteria such as novelty, inventive step or reproducibility.

Likewise in T. 688/91 the board stated that a broad claim was not to be equated with one lacking clarity. The claim was worded as follows: "Integrated microprogrammed apparatus [...] with apparatus to generate [...] T-states [...] characterised in that [...] the generation [...] of the [...] T-states [...] is in each case effected as a function of preceding T-states and of state parameters such as the instantaneous values of state and/or mode signals [...]". The board held that, even if the words "such as" were understood to mean "for example", with the result that the subsequent information was not to be interpreted in a restrictive sense, the words "state parameters" were clear in as much as they conveyed the fact that T-state generation was to be effected as a function of any parameters representing one of the states of the apparatus. Although the claim was to be regarded as broad, since the terms used were open to general interpretation, breadth was not to be equated with an absence of clarity.

In T. 630/93 the board noted that Art. 84, first sentence, EPC 1973 implied that it was not always necessary for a claim to identify technical features or steps in full detail. The function of the essential features, although normally expressed in technical terms, was often to define the borders of an invention rather than details of the invention within those borders. Thus, essential features could often be of a very general character and in extreme cases indicate only principles or a new idea (see also chapter II.C. "Sufficiency of disclosure").

In T. 29/05 it was held that the existence of unrelated subject matter in the claims at issue was merely hypothetical, and no evidence had been provided by the examining division to support its possible presence in the prior art. In the absence of such evidence, each and every nucleic acid molecule (as specified) had to be assumed to be related to the subject matter disclosed in the application. The fact that a large number of possible nucleic acid sequences might fall within the scope of the claim was not a reason for raising a lack of clarity objection.

In T.2154/11 the board held that the objections of the examining division that the expressions "metadata describing an event", "taking", "connecting" were broad and embraced well-known activities were not considered per se a valid reason for a lack of clarity. The fact that some of these method steps might be understood to refer to "mental acts" or "normal human actions" was also no valid reason for a finding of lack of clarity as long as these steps did not give rise to ambiguity, as in the case in hand. If a method step could be interpreted to refer to a normal human activity, then this assessment should be taken into account for novelty and inventive step.

The principle whereby a broad claim is not unclear per se was applied in several decisions (see inter alia T.456/91, T.393/91, T.530/94, T.950/97, T.1345/08, T.2220/09, T.125/15).

3.4. Functional features

In T.68/85 (OJ 1987, 228) the board found that functional features defining a technical result were permissible in a claim (i) if, from an objective viewpoint, such features could not otherwise be defined more precisely without restricting the scope of the invention, and (ii) if these features provided instructions which were sufficiently clear for the expert to reduce them to practice without undue burden, if necessary with reasonable experiments. The board further pointed out that the effort to define a feature in functional terms had to stop short where it jeopardised the clarity of a claim as required by Art. 84 EPC 1973. The following decisions agreed with these findings: T.139/85, T.292/85 (OJ 1989, 275), T.293/85, T.299/86 (OJ 1988, 88), T.322/87, T.418/89 (OJ 1993, 20), T.707/89, T.204/90, T.752/90, T.388/91, T.391/91, T.810/91, T.822/91, T.894/91, T.281/92, T.490/94, T.181/96, T.750/96, T.265/97, T.568/97, T.484/98, T.1186/01, T.295/02, T.499/02, T.1173/03, T.404/06, T.959/08, T.560/09, T.556/11, T.754/13, T.2067/12, T.2427/13. Some of these decisions (see e.g. T.204/90, T.181/96, T.265/97) examine a third criterion, which is not strictly speaking a requirement under Art. 84 EPC 1973 and requires that (iii) the state of the art does not stand in the way of using such functional and therefore general and broad terminology.

In T.361/88 the board distinguished between two types of functional feature: the first type of functional feature is related to process steps which are known to the man skilled in the art and may easily be performed in order to obtain the desired result; the second type of functional feature consists of process steps defined by the result which is aimed at. This is also allowable as long as the man skilled in the art knows, without exceeding his normal skills and knowledge, what he has to do in order to obtain said result.

In case T.720/92 the board noted that the term "clarity" in Art. 84 EPC 1973 referred to the practical meaning of the language of the patent claims. Claims with functional features which do not enable the skilled person to carry out the invention in the light of the disclosure and on the basis of common general knowledge do not meet the requirement of clarity according to Art. 84 EPC 1973. A claim combining functional definitions limited to features, which a skilled person would have no difficulty in determining on the basis of common general knowledge, and a structural definition of the essential contribution of the applicant is not objectionable under Art. 84 EPC 1973.

In T. 560/09 the board emphasised with regard to technical features expressed in general functional terms that the function must be able to be verified by tests or procedures adequately specified in the description or known to the skilled person. That meant not only that a feature in the claim must be comprehensible, but also non-ambiguous in that it could be determined without any ambiguity whether the claimed functional requirement was satisfied (see T. 2427/13). Hence, means of distinction were mandatory in order to allow a definition by a function instead of by a structure in a claim.

In T. 243/91 it was stated that a functional feature was allowable if that feature provided a clear instruction to a skilled person to reduce it to practice without undue burden. In T. 893/90 the feature "being present in amounts and proportions just sufficient to arrest bleeding" was held to be a functional feature which defined a technical result which also constituted a testable criterion to be satisfied by the claimed pharmaceutical composition. Because such testing involved only routine trials, the adopted functional language was allowable. The introduction of a reference to specific amounts and/or proportions of the components would limit the claim and was not necessary. The situation in T. 893/90 was distinguished from the one before the board in T. 181/96. Although in the former case the testing might appear prima facie bothersome, it was nothing out of the ordinary for the field of medicine, involving only routine trials. In the case in hand, however, which concerned an apparatus for hydrostatically testing a sealing element of a threaded connection between two connected sections of pipe, there was no general type of pipe connections with generally well-defined ranges of dimensions which were thus generally available for verification of the functional features as such. In T. 1802/12 the board stated that the description did not contain any test to verify whether the functional features were present after having applied the claimed method. The board concluded that – contrary to the situation in T. 893/90, where a test was available – the requirements of Art. 84 EPC were not met.

In T. 391/91 claim 1 set out in general terms the sequence of steps to be followed in order to put the invention into practice, i.e. in order to produce unicellular micro-organism host cells having INA (ice nucleation activity) or enhanced INA. The claim was in fact a generalisation from the particular examples. The board stated that as there was no reason to doubt that it was possible to generalise the specific teaching of the examples given, it would be unfair to the appellant to require a restriction of the claim by incorporation therein of the specific features of the examples. The skilled person could use any suitable variant capable of providing the same effect of the invention. This might be tedious, but it was nothing out of the ordinary in this field and involved only routine trials. The claim was thus allowable under Art. 84 EPC 1973.

In T. 241/95 (OJ 2001, 103) the Swiss-type second medical use claim defined the disease or disorder to be treated with substance X as "condition which is capable of being improved or prevented by selective occupation of the serotonin receptor". The board held that this functional definition was unclear because no test was at hand to determine whether the therapeutic effects were a result of the newly discovered property of X of occupying the serotonin receptor or any other known or unknown property of that substance.

The board in **T. 830/08** was concerned with the clarity of a claim directed to a second medical use. Such claims are considered clear only if the disease to be treated are clearly defined in it (e.g. **T. 1048/98**). In the case in hand the disease to be treated was defined in functional terms as "the preferential induction of apoptosis in a first population of cells compared to a second population of cells wherein the cells of the first population are tumour cells". The question was whether the skilled person could clearly attribute a disease or group of diseases to this functional definition. In the board's view, this was not the case. The skilled person reading this definition in claim 3 would be struck, on the one hand, by the explicit mention and the specific definition of the first population of cells and by the explicit mention, but absence of specific definition of the second population of cells, on the other hand.

In **T. 1074/00** the board considered that the term "capable of hybridising under stringent conditions" was sufficiently clear for the purposes of Art. 84 EPC 1973, having regard to the particular nature of the subject-matter (see also **T. 29/05**). The board found that, although different experimental protocols might be applied for assessing hybridization under stringent conditions, this did not mean that these protocols would lead to different results as far as the detected nucleotide sequence was concerned. Moreover, it had to be taken into account that the present claim defined its subject-matter also by a further functional feature relating to the biological activity.

In **T. 151/01** the product claim at issue was intended to be restricted vis-à-vis the prior art embodiments by a functional feature, namely that the amount of the ingredient present in the composition must be a "therapeutic amount". The board had no doubt that the skilled person was perfectly able in most cases to decide whether a certain amount of a given non-steroidal anti-inflammatory agent had a therapeutic effect or not. However, it pointed out that, in order to establish the lower limit of the therapeutic amount for a given non-steroidal anti-inflammatory agent, in other words, in order to clearly establish the scope of protection of the claims, a standard test was required, since the result would strongly depend on the experimental method used. As there was no such test in the description or known to the skilled person, the board concluded that the claim did not fulfil the requirement of Art. 84 EPC 1973.

In **T. 143/06** the density of the product which was "close to the theoretical maximum" was identified by the board as a functional feature of the product inextricably linked to the process conditions for obtaining the product. There was thus no objection of lack of clarity under Art. 84 EPC.

3.5. Characterisation of an invention by a parameter

In decision **T. 94/82** (OJ 1984, 75) the board ruled that the requirement of clarity could be fulfilled in a claim to a product if the characteristics of the product were specified by parameters related to the physical structure of the product, provided that those parameters could be clearly and reliably determined by objective procedures which were usual in the art (see also **T. 452/91**, **T. 541/97**, **T. 437/98**, **T. 193/01**). It is not mandatory to give instructions in the claim itself as to how the product is to be obtained (**T. 94/82**).

In T.849/11 the board summarised case law on the requirements of Art. 84 EPC with regard to the characterisation of an invention by parameters. The board stated that: i. the claims must be clear in themselves when read by the skilled person; and ii. the method for measuring a parameter (or at least a reference thereto) must appear completely in the claim itself (see T.1156/01, T.412/02, T.908/04, T.555/05, T.1497/08), and that iii. the applicant who chooses to define the scope of the claim by parameters should ensure that a skilled person can easily and unambiguously verify whether he is working inside or outside the scope of the claim. The board further stated that the requirements of Art. 84 EPC can still be met if it can be convincingly shown that: i. the method to be employed belongs to the skilled person's common general knowledge, or ii. all the methodologies known in the relevant technical field for determining this parameter yield the same result within the appropriate limit of measurement accuracy (see T.1156/01).

In T.29/05 it was found that although different experimental protocols might be applied in the case in point for assessing hybridisation under stringent conditions, they were usual in the art (following T.1084/00).

In T.307/06 the claims contained the added feature "and a T_g of less than 25°C ". The board noted that there were different methods for determining T_g (glass transition temperature). However, the mere fact that several methods existed did not render the claims unclear if at least one of the following conditions was met: (a) the different methods yield essentially the same T_g values for the same material, or (b) the person skilled in the art had associated the range of T_g values mentioned in claim 1 at issue with only one standard method of measurement. Neither condition (a) nor (b) was fulfilled. The board concluded that this left doubt as to which subject-matter was covered by claim 1, and thus rendered said claim unclear (see T.728/98, OJ 2001, 319; T.306/13).

In a number of decisions the boards stress that it must be clear to the skilled reader from the claim itself how the parameters are to be determined, unless it can be demonstrated that the skilled reader would immediately know which method and conditions to apply even without any such indication in the claim.

In T.412/02 the board held that the unambiguous characterisation in a claim of a product by parameters or by a mathematical relation between parameters necessarily required that each parameter could be clearly and reliably determined. In the board's view, it followed that the knowledge of the method and conditions of determination of the parameter was necessary for the unambiguous definition of the parameters and, as a consequence, for the unambiguous definition of a mathematical relation between them. Thus, in order to allow the matter for which protection was sought to be defined, it had to be clear from the claim itself when being read by the person skilled in the art exactly how the parameters should be determined. This would, as a rule, imply that the method of determination and the conditions of measurement which might have an influence on the value of the parameter should be indicated in the claim, either expressly or, if appropriate, by way of reference to the description according to R.29(6) EPC 1973. Such indication would only become superfluous provided it could be shown that the skilled person would know from the outset which method and conditions to employ. See also T.1156/01.

In T. 1819/07 the board held that the parameter "average particle size" rendered the claim unclear as neither the type of average (volume, surface, number) nor a method for determining it was indicated in the claims. See also T. 967/08 and T. 45/10.

In T. 992/02 the board took the view that whilst noting the general principle that the claims must be clear per se, the non-inclusion in the claim of the method whereby one of the parameters characterising the composition claimed (level of formation of volatiles) could be measured was justified by the requirement that the claims be concise. It considered that such a conclusion could be reached in the case in hand because the method was clearly identified in the description and did not give rise to any ambiguity.

In T. 2086/11 the parameter "mean aspect ratio" represented the mean of the individual aspect ratios, defined as the ratio of the major axis to thickness, of 50 aluminium flake particles having major axes of not more than 10 µm. The board held that this parameter did not enable to distinguish which subject-matter is covered by the claims and which is not. According to the method of measuring explained in the description, the investigated sample contained thousands of particles having a major axis of not more than 10 µm and the method described in the application did not give any precise indication of how to select such 50 particles. One operator, by selecting at random one group of 50 particles, could measure a mean aspect ratio within the claim whilst another operator, by selecting a different group of 50 particles, could find a value of mean aspect ratio outside the claim. The parameter "mean aspect ratio" was thus by itself insufficient to characterise the claimed product in a reliable way and did not comply with Art. 84 EPC 1973.

3.6. Unspecified features and relative qualities

Unspecified features are permitted as follows:

- (a) To avoid an undue limitation of the scope of the claim where the person skilled in the art can verify the result by tests involving nothing more than trial and error (T. 88/87).
- (b) To render the meaning of the feature intelligible from the actual claim.

Thus, the objection in T. 487/89 was based on the fact that the claim had indicated both tenacity and toughness with a lower but no upper limit. The opposition division took the view that such "open-ended" parameters were always objectionable if they related to an inherently desirable characteristic. The board, however, held that whether the absence of an upper or lower limit was acceptable in a claim in any individual case depended on all the surrounding circumstances. Where, as in the case in question, the claim sought to embrace values as high as could be attained above a specified minimum level, given the other parameters of the claim, then such open-ended parameters could not normally be objected to. This decision was confirmed by T. 129/88 (OJ 1993, 598), T. 87/84, T. 92/84, T. 136/84, T. 297/90 and T. 1018/05, although in the last two cases a role was played by the question of sufficient disclosure (see also T. 989/95, in which T. 487/89 was agreed with but not applied). In T. 586/97, on the other hand, the board found that the absence from any independent claim of any upper limit on the amount of a particular detrimental but necessary component in the chemical composition claimed was at variance with the aim

of the invention as set out in the description, namely, to decrease the percentage of the undesirable ingredient in the claimed composition. The claim was thus so broad it went beyond the scope of the invention as disclosed in the description. Therefore the requirement of Art. 84, second sentence, EPC 1973 was not met.

In T 227/91 (OJ 1994, 491) the claims comprised a coating thickness defined by a formula with two parameters (a) and (t). Parameter (a) represented the thermal diffusivity of the coating means and was therefore a feature inherent in the instrument. Parameter (t) represented the effective pulse time of the laser and was related to the laser operating conditions, not to the structure of either the laser or the instrument. The thickness defined in the claims was still connected with the mode of operation of the laser, that is, with a human factor irrelevant to the instrument per se. The extent of the protection conferred by the subject-matter of the claims was therefore regarded by the board as ambiguous and indefinite.

In T 455/92 independent claim 2 was worded as follows: "Covering [...] for a pressing [...], characterised by: (a) a length which corresponds at least to the circumference of the shell face of the pressing to be covered, (b) an overall breadth sufficient to cover the shell face and both end faces of the pressing, and (c) a fold such that [...] the breadth [...] corresponds to the breadth of the shell face of the pressing [...]". The board did not see this as a breach of Art. 84 EPC 1973, since reference had been made to a physical entity which was known; hence the range of sizes was definable in so far as it excluded packaging materials for other physical entities. Furthermore, it was self-evident to a skilled person in this field that the size of the packaging material (the covering) was dependent on the physical entity to be packed. In T 1020/13, however, the definition of a claimed entity by reference to a second entity that was not part of the claim was deemed a breach of Art. 84 EPC.

In T 860/93 (OJ 1995, 47) the board decided as follows: Where a quality is expressed in a claim as being within a given numerical range, the method for measuring that quality must either be general technical knowledge, so that no explicit description is needed, or a method of measuring that quality needs to be identified (decision T 124/85 followed). In contrast, where a claim specifies a relative quality, in this case that the products should be "water-soluble", it is not normally necessary to identify any method for its determination (for the term "soluble" see also T 785/92, T 939/98, T 125/15). In T 860/95 ("for a long period of time"), T 649/97 ("transparent"), T 1041/98 ("thin plate"), T 193/01 ("thin film"), T 545/01 ("flat") and T 378/02 ("smooth"), the boards confirmed that the use of a relative term in a claim may be accepted where the skilled person is able to understand the meaning of this term in a given context. However, in T 728/98 ("substantially pure"), T 174/02 ("[in] quick [succession]") and T 1640/11 ("value") the boards ruled that the relative terms at issue were unclear.

In the application at issue in T 1888/12, claim 1 referred to undated ISO standards. The board pointed out that such standards were typically revised over time, and the possibility of substantial changes could not be ruled out (see T 783/05). The appellant's argument that the date to be taken into account was the application's priority date did not convince the board because there was no such indication in the description. In the board's view, the definition of technical features by general reference to ISO standards was not sufficiently

clear. However, in **T. 2187/09**, the board decided that the UNISIG standard mentioned in the claim merely provided context for the invention. Details of the standard were not needed to define the scope of the invention and to enable the skilled person to know if he was working within or outside the claimed scope.

3.7. Principles in connection with categories of claim

In **T. 688/91** the board found that the fact that claims of different categories were deemed to be independent claims did not preclude reference to other independent claims. In the board's view, however, any such reference had to make perfectly clear whether or not the reference was intended to replace features. In the former case, it had for reasons of clarity to replace all the features, and in the latter case none.

In case **T. 410/96** concerning a data processing system the question arose whether it was permissible for a claim to a system to refer back to a claim to a method. The board held that, although **R. 29(4) EPC 1973** mentioned a reference only in the context of a claim including all the features of the claim it referred to, this did not imply a contrario that a reference which did not fulfil this condition was necessarily impermissible. The board found that there was no a priori objection under **Art. 84 EPC 1973** to an independent claim which partially drew its features from preceding claims of a different category. The essential features were thus incorporated in the disputed claim by reference, the claim thus complying with **R. 29(3) EPC 1973** (**R. 43(3) EPC**).

In **T. 1722/11** a claim related to a computer program resident on computer-readable media was defined by reference to a method claim. The execution of the method required co-ordinated interaction between various resources in a communication network. As these resources were at different, mutually remote locations, the board considered it unclear how the method referred to could be executed solely by a (single) computer program when run on a computer. The claim thus lacked clarity.

In decisions **T. 418/92** and **T. 453/90** the boards confirmed that it was possible for claims to relate to both physical activities and physical entities, in particular where the inventions concerned were fully disclosed as processes to the skilled person only if apparatus features were also included in the definition. In **T. 1046/05** too the board confirmed the clarity of an apparatus feature in a process claim.

In **T. 426/89** (OJ 1992, 172) the board decided that a claim relating to a "method for operating" a device was not "clear" (**Art. 84 EPC 1973**) if the claimed features only described how the device worked.

In **T. 841/95** the board found that where a claim for an apparatus sought to define the invention by reference to features of the use to which the apparatus was to be put, a lack of clarity could result. However, if the subject-matter of the application was an apparatus and it was not viable to define the apparatus other than by reference to the said use, an apparatus claim directed to a combination of apparatus and use and defining the apparatus unambiguously could be clear.

Including in a device claim "for carrying out a process" a reference back to an earlier claim did not alter the fact that it was an independent (non-process) claim; rather, it limited the claimed device to being suitable to carry out the process referred to (T. 1017/98).

A claim in T. 952/99 contained two different aspects of a use claim: on the one hand it defined the use of a particular physical entity to achieve an 'effect', and on the other it defined its use to produce a product. Although a use claim normally falls into either one category or the other, the board found that such a clear distinction was not possible in this case. The claim contained both application and process features and there was a technical affinity between the additional process step and the 'core' of the invention. Both the application and process features were thus technical features of the invention, so that their combination did not contravene R. 29(1) EPC 1973, the relevant criterion for assessing the extent to which the combination of a 'use' claim and technical process features was allowable from the point of view of clarity. The board drew a distinction with T. 796/91, in which it had been held that the heterogeneous combination of process features and application features rendered the claim fundamentally unclear. That case had concerned the combination of a process claim and a use claim with no process claim at all. In contrast to the case before the board, the process features had apparently had no affinity to the application features, which had made it impossible to subsume the two different types of technical feature under one claim.

In T. 921/11 the board considered that the claims as a whole, construed in the light of the description, were so unclear as to the meaning of the term "system" that the skilled reader was neither in a position to recognise the nature of the claimed subject-matter nor the category to which claim 1 belonged.

For the particularities of product-by-process claims, see in this chapter II.A.7.

4. Disclaimer

Disclaimers play an important role in the drafting of claims and amendments. The principles concerning the allowability of disclaimers are set out in chapter II.E.1.7.3 e "Drafting of disclaimers – clarity".

5. Claims supported by the description

5.1. General principles

Art. 84 EPC stipulates that the claims must be supported by the description. This requirement means that the subject-matter of the claim must be taken from the description and it is not admissible to claim something which is not described.

In decision T. 133/85 (OJ 1988, 441) the board took the view that a claim which did not include a feature described in the application (on the proper interpretation of the description) as an essential feature of the invention, and which was therefore inconsistent with the description, was not supported by the description for the purpose of Art. 84 EPC 1973. The boards apply this principle as part of their established

jurisprudence, see e.g. T. 409/91 (OJ 1994, 653), T. 939/92, T. 322/93, T. 556/93, T. 583/93, T. 659/93, T. 482/95, T. 616/95, T. 586/97, T. 687/98, T. 1076/00, T. 637/03. However, the requirement for all essential features to be indicated is inferred to some extent from different provisions of Art. 84 EPC (see in this chapter II.A.3.2.). In T. 2049/10 the board considered the topic "essential feature missing" explicitly not a question of clarity but of support by the description (both subsumed under Art. 84 EPC).

Many boards further stress that the requirement for the claims to be supported by the description was intended to ensure that the extent of protection as defined by the patent claims corresponds to the technical contribution of the disclosed invention to the art (see T. 409/91, OJ 1994, 653; T. 435/91, OJ 1995, 188; T. 1055/92, OJ 1995, 214; T. 659/93; T. 825/94; T. 586/97; T. 94/05; T. 1217/05; T. 1694/12; T. 809/12). Therefore the claims must reflect the actual contribution to the art in such a way that the skilled person is able to perform the invention in the entire range claimed (T. 659/93, T. 94/05). A purely formal support by the description, i.e. a verbatim repetition of the mention of a claimed feature, cannot meet these requirements (T. 94/05; see also T. 127/02, T. 1048/05, T. 758/13). However, according to a different view, a review of the discussions in the various drafts to be found in the preparatory material suggests that the requirement for support of the claims was viewed rather as a formal matter to ensure that the description and claims had the same extent (T. 1020/03, OJ 2007, 204). In the case in point the board concluded that Art. 84 EPC 1973 could not be used to force an applicant to cut down the scope of first or second medical use claims considered too broad compared to any use disclosed in the description. Other decisions in turn consider both aspects (see e.g. T. 297/05).

The description and drawings are used to interpret the claims. For case law in relation thereto see in this chapter II.A.6.3.

5.2. Restrictions on generalising the technical information and examples adduced in the description

The question of the extent to which the technical information and examples adduced in the description may be generalised in the formulation of the claims is usually examined in the context of the requirements of Art. 83 EPC (see in particular chapter II.C.5. "Clarity and completeness of disclosure"). Sometimes though it is also considered in the context of the requirement for support by the description. See also chapter II.C.8. "The relationship between Article 83 and Article 84 EPC".

In T. 2231/09 the patent concerned a method of representing and analysing images. Claim 1 of the main request set out that "... at least one said descriptor element is derived using only a subset of pixels in said image." The appellant had put forward an interpretation according to which a "subset" could correspond to all pixels in the image, which the board considered inconsistent with essential parts of the described embodiments. The board stressed that, while a certain degree of generalisation may be permitted, features as claimed should make it possible to clearly identify features of embodiments that are covered by the terms of a claim. Moreover, the generalised subject-matter as claimed should make it possible to understand the technical problem to be solved. The terms of a

claim should be commensurate with the invention's technical contribution to the art. The board regarded the division of the image into regions and subsets as essential for achieving the technical effect underlying the invention. Therefore, claim 1 was not supported by the description and did not comply with Art. 84 EPC 1973.

In T. 659/93 the board held that the requirement that the claims should be supported by the description meant that they had not only to contain all the features presented as essential in the description, but had also to reflect the applicants' effective contribution by enabling the skilled person to carry out their teaching throughout the field to which they applied (similarly T. 332/94 with reference to T. 409/91, OJ 1994, 653).

In T. 939/92 (OJ 1996, 309) the examining division had raised the objection that the disputed claim was an unreasonable generalisation of the examples contained in the description. However, the board held that it did not follow from Art. 84 EPC 1973 that a claim was objectionable just because it was "unreasonably broad". The expression "supported by the description" meant that the technical features stated in the description as being essential features of the invention described must be the same as those used to define the invention in the claims, for otherwise the claims would not be true definitions but mere descriptions. If a claim concerned a group of chemical compounds per se, an objection of lack of support by the description could not properly be raised for the sole reason that the description did not contain sufficient information in order to make it credible that an alleged technical effect (which was not, however, a part of the definition of the claimed compounds) was obtained by all the compounds claimed (see, with regard to Art. 83 EPC, also T. 2001/12). The facts of the case in question differed from those underlying T. 409/91.

In T. 94/05 the board pointed out that the requirement for the claims to be supported by the description was intended to ensure that the extent of protection as defined by the patent claims corresponds to the technical contribution of the disclosed invention to the art (see also T. 409/91, T. 435/91). Therefore the claims must reflect the actual contribution to the art in such a way that the skilled person is able to perform the invention in the entire range claimed (T. 659/93). In the board's view, a purely formal support by the description, i.e. a verbatim repetition of the mention of a claimed feature, could not meet these requirements. To be allowable, functional features must disclose a clear teaching which the skilled person can carry out without undue burden (see T. 68/85, OJ 1987, 228). From this, it followed that the skilled person, at least after reading the patent specification, taking account of his common general knowledge, and possibly also after carrying out normal experiments, must actually be provided with at least a plurality of different embodiment variants. The reproducibility from the patent specification of the above-mentioned functionally defined feature was confined to the sole embodiment described. The board concluded that the functional definition in claim 1 did not adequately reflect the technical contribution described in the patent specification. Moreover, claim 1 and the description were contradictory, so that the claim was not supported by the description and the requirements under Art. 84 EPC were not met.

In T. 568/97 the claims defined the physiological effect to be achieved by a sufficiently high concentration of vasoactive intestinal polypeptide and/or prostaglandins as active agents

in a pharmaceutical composition for transurethral administration. Neither individual values nor ranges of the amounts of vasoactive intestinal polypeptide and/or prostaglandins were disclosed in the patent. Furthermore, it was impossible to find out without undue burden the physiologically effective amounts as claimed merely on the basis of common general knowledge. The board held that the description of the patent lacked support within the meaning of Art. 84 EPC 1973 as to the amount of vasoactive intestinal polypeptide and/or prostaglandins required to achieve a physiologically effective dose. The functional feature not only had to be such that the skilled person could understand it; he also had to be able to implement it.

In T 484/92 the board concluded that, in contrast to T 409/91, the requirement of support by the description had been met and the appellant was entitled to claim the alleged invention in broad functional terms, i.e. in terms of the desired end effect, because, having disclosed one mechanism for achieving that goal, there were alternative ways of performing the invention at the disposal of the person skilled in the art, which would become apparent to him upon reading the description, based on his common general knowledge.

5.3. Bringing the description into line with amended claims

In T 977/94 the board decided that if the patentee amended his claims he had also to bring the description into line with them, because of its fundamental importance. An invention was only claimable to the extent that it was supported by the description (Art. 84, second sentence, EPC 1973), and the claims were interpreted in the light of the description (Art. 69 EPC 1973). So it was necessary to check that the essential elements of the invention claimed were also described as such in the description (see T 300/04).

In T 295/02 the board found that an inconsistency between a claim and the provisional description was not a valid reason to refuse the application if the inconsistency arose from an amendment, if it was apparent that the text of the description was not intended by the applicant to form the agreed basis of any decision, especially one concerning its consistency with the amended claims, and if the appellant was prepared to adapt the description to conform to a definite allowable set of claims.

In T 1808/06 the board recalled that, in order to meet the requirement of Art. 84 EPC that the claims have to be supported by the description, any disclosure in the description and/or drawings inconsistent with the amended subject-matter should normally be excised. Reference to embodiments no longer covered by amended claims must be deleted, unless these embodiments can reasonably be considered to be useful for highlighting specific aspects of the amended subject-matter. In such a case, the fact that an embodiment is not covered by the claims must be prominently stated. Reference to Art. 69(1) EPC was not an appropriate justification for a less stringent adaptation of the description and in so far misleading as it could be understood to suggest a direct applicability of its contents at the examination or opposition stage. This was clearly not the case as Art. 69(1) EPC related to the scope of protection. It was only in situations where the removal of inconsistencies was not possible for procedural reasons (e.g. no amendment possible of the granted

version) that – purely as an auxiliary construction – Art. 69(1) EPC could be invoked for an interpretation of the claimed subject-matter.

6. Interpretation of claims

6.1. General principles

According to the established case law, the skilled person should try, with synthetical propensity, i.e. building up rather than tearing down, to arrive at an interpretation of the claim which is technically sensible and takes into account the whole disclosure of the patent. The patent must be construed by a mind willing to understand, not a mind desirous of misunderstanding (see inter alia T 190/99, T 920/00, T 500/01, T 749/03, T 405/06, T 2480/11, T 2456/12, T 383/14, T 1477/15).

A considerable number of decisions held that the skilled person, when considering a claim, should rule out interpretations which are illogical or which do not make technical sense (see inter alia T 190/99, T 552/00, T 920/00, T 1023/02, T 749/03, T 859/03, T 1537/05, T 1204/06, T 681/15). Some decisions (T 1408/04, T 1582/08, T 493/09, T 5/14, T 2110/16) emphasised that this is understood to mean only that technically illogical interpretations should be excluded. A mind willing to understand did not require that a broad term needed to be interpreted more narrowly (even if, as in the case underlying T 1408/04, the narrower interpretation would refer to a structure which is very common, but not exclusive, in the technical field concerned).

In T 1771/06 a claim specifically referred with closed language to the characterising part (GBSS gene fragment in the antisense direction) of the gene construct and, in an attempt to generalise, left open other structural elements necessary to operate the system ("comprising a fragment ... which codes for, said fragment consisting of a nucleotide sequence selected from ... SEQ ID No: ..."). According to the board this was not an unusual claim formulation. The board did not accept the appellant's argument that the scope of the claim extended to gene constructs which comprised any DNA in addition to the GBSS gene fragments. The skilled person would certainly take into account the fact that the gene construct was made for the purpose of introducing the GBSS DNA fragment into the potato cells and integrating it into the genome. Accordingly, the gene construct would be thought to contain all necessary DNA elements for these steps to take place.

In T 409/97 the board held that an erroneous statement in the introduction to the description was of no assistance in interpreting the claim and establishing the subject-matter for which protection was being sought, where this statement contradicted its actual content.

Two methods having no technical bearing on each other cannot form a single multi-step process (i.e. a "technical whole") even though they are linguistically linked together in a claim (T 380/01).

In T 1513/12 the board noted that an interpretation of a claim agreed by the parties to the proceedings was not to be regarded as binding on the board: the "principle of party

disposition" was not to be understood as meaning that the parties to the proceedings could choose an interpretation of the patent which, although it might be satisfactory for them, might have implications for others not party to the proceedings.

6.2. Meaning of terms and phrases: "comprising (substantially)", "consisting (essentially) of", "containing"

In [T. 759/91](#) and [T. 522/91](#) the claims contained the expression "comprising substantially". The board was of the opinion that this term lacked clear, explicit boundaries and its scope needed interpretation. While in everyday language the word "comprise" might have both the meaning "include" or "comprehend" and "consist of", in drafting patent claims legal certainty normally required it to be interpreted by the broader meaning "include" or "comprehend" (see e.g. [T. 457/02](#)). The word "substantially" imposed a restriction on the word "comprising" in the sense that "to a large extent only that is comprised which is specified". The boundaries of the term "comprising substantially" were therefore to be drawn where the essential characteristics of the specified subject-matter ceased. The scope of the term "comprising substantially" was therefore interpreted as being identical to that of "consisting essentially of". However, in view of the unequivocal character of the words "consisting of" as compared to "comprising", the expression "consisting essentially of" was to be given preference. See also [T. 1730/09](#), [T. 274/16](#).

In [T. 1599/06](#) the board likewise had to interpret the term "comprising". It emphasised that the meaning of terms in a patent claim has to be determined from the point of view of the skilled person, who reads the claim in the context of the application and against the background of his/her common general knowledge. The claim was directed to a vaccinating agent comprising at least one specific purified and isolated protein of *Mycobacterium tuberculosis*. The examining division had interpreted the term "comprising" broadly and held that the claimed subject matter lacked novelty in relation to a partially purified protein fraction which, in their view, contained inter alia the specified proteins. In the board's view, however, the skilled person would derive from the application as a whole the information that the specific characteristic of the vaccinating agents according to the invention was their generation from isolated and purified *Mycobacterium tuberculosis* proteins. Therefore, he/she would have considered that the definition in claim 1 covered vaccinating agents that, firstly, were constituted from isolated and purified proteins as mentioned in the claims and, secondly, contained those proteins as their main constituents.

In [T. 390/08](#) the board held that the definition of a composition as "consisting of" compulsory and optional components met the requirements of [Art. 84 EPC](#), as such a composition defined a "closed" composition from which elements other than those mentioned were excluded. See also [T. 1190/01](#), [T. 1998/07](#).

In [T. 2027/13](#) the claimed composition was defined by an open formulation (in view of the word "comprising"), which already implied the presence not only of the optional excipients, but also of any additional pharmaceutically acceptable components (including impurities) and even of further release controlling agents, and the expression "consisting essentially of", which referred to a single ingredient of the composition. As the usual reading of this

expression did not make sense in the case in hand, the skilled person reading the claim was at a loss as to the possible limitation introduced by the expression.

In T 1023/02 the board expressed its view that a claim using "comprising" language should generally not be construed as covering subject-matter which included further steps of a nature that would manifestly counteract the specified technical purpose of the step(s) recited in the claim.

In T 405/00 the board considered that, according to the language conventional for patent claims in the field of chemistry, the wording "composition comprising a persalt" defined exclusively the mandatory presence of at least one of the specific chemical compounds belonging to the group of persalts.

In decision T 711/90 the board confirmed the assumption in the case law that the substitution of the term "consists of" for "contains" in a claim raised the question of clarity of the claim. When, as in the claim in question, the glass consisted of components denoted (i), (ii) and (iii), the presence of any additional component was excluded and, therefore, the proportions of the components (i), (ii) and (iii) expressed in percentages should have added up to 100 mole % for each claimed composition.

See also chapter II.E.1.15. ""Comprises", "consists of", "consists essentially of", "contains"".

6.3. Using description and drawings to interpret the claims

6.3.1 General principles

The subject-matter of claims is governed by Art. 84 EPC and their function by Art. 69 EPC. According to Art. 84 EPC the claims define the invention for which protection is sought. According to Art. 69 EPC the claims determine the extent of the protection which will be conferred by the patent, through their definition of the invention. Under Art. 69 EPC the description and drawings are used to interpret the claims. The question arises whether it is possible to interpret the claims in the light of the description and drawings as provided in Art. 69 EPC merely in order to determine the extent of protection or whether it is also possible to do so in order to establish whether the conditions governing patentability and clarity have been satisfied.

In a number of decisions, such as T 23/86 (OJ 1987, 316), T 16/87 (OJ 1992, 212), T 89/89, T 121/89, T 476/89, T 544/89, T 565/89, T 952/90, T 439/92, T 458/96, T 717/98, T 500/01, T 1321/04, T 1433/05 and T 2145/13, the boards of appeal have laid down and applied the principle whereby the description and drawings are used to interpret the claims and identify their subject-matter, in particular in order to judge whether it is novel and not obvious. Likewise, in a large number of decisions (e.g. T 327/87; T 238/88, OJ 1992, 709; T 416/88; T 194/89; T 264/89; T 430/89; T 472/89; T 456/91; T 606/91; T 860/93; T 287/97; T 250/00; T 505/04; T 711/14), the boards interpreted the claims in the light of the description and drawings in order to establish whether they were clear and concise within the meaning of Art. 84 EPC 1973.

Occasionally, however, the limits to interpretation in the light of the description and drawings are emphasised (see in this chapter [II.A.6.3.6](#)). A discrepancy between the claims and the description is not a valid reason to ignore the clear linguistic structure of a claim and to interpret it differently ([T.431/03](#)) or to give a different meaning to a claim feature which in itself imparts a clear credible technical teaching to the skilled reader ([T.1018/02](#), [T.1395/07](#), [T.1456/14](#)). In [T.1023/02](#), though, "unfortunate" claim language ("transcription" instead of "translation") in contradiction with the terms used in the description was interpreted differently.

In [T.2221/10](#) the board referred to established case law according to which the description can be used as the patent's "dictionary" to assess the correct meaning of ambiguous terms used in claims (see in this chapter [II.A.6.3.3](#)). However, if a term used in a claim has a clear technical meaning, the description cannot be used to interpret such a term in a different way. In case of a discrepancy between the claims and the description, the unambiguous claim wording must be interpreted as it would be understood by the person skilled in the art without the help of the description.

In [T.197/10](#) the board explained that if the claims are worded so clearly and unambiguously as to be understood without difficulty by the person skilled in the art, there is no need to use the description to interpret the claims. In the event of a discrepancy between the claims and the description, the unambiguous claim wording must be interpreted as it would be understood by the person skilled in the art without the help of the description. Thus, in the event of a discrepancy between clearly defined claims and the description, those elements of the description not reflected in the claims are not, as a rule, to be taken into account for the examination of novelty and inventive step.

6.3.2 Relevance of [Article 69 EPC](#)

Several decisions refer to [Art. 69\(1\) EPC 1973](#) ([T.23/86](#), OJ 1987, 316; [T.16/87](#), OJ 1992, 212; [T.238/88](#), OJ 1992, 709; [T.476/89](#); [T.544/89](#); [T.565/89](#); [T.952/90](#); [T.717/98](#)). Other case law emphasises that [Art. 69 EPC 1973](#) ([Art. 69 EPC](#)) and its Protocol are primarily for use by the judicial organs which deal with infringement cases (see e.g. [T.1208/97](#), [T.223/05](#); also [T.1404/05](#)). The board in [T.556/02](#) made it clear that it applied solely the general principle of law applied throughout the EPC that a document had to be interpreted as a whole (see e.g. [T.23/86](#), OJ 1987, 316; [T.860/93](#), OJ 1995, 47). [Art. 69 EPC 1973](#) was a specific application of this general principle. See also [T.1871/09](#), [T.1817/14](#).

In [T.1646/12](#) the appellant, citing [Art. 69\(1\) EPC](#) and [T.1808/07](#), argued that the opposition division should have used the description to interpret claim 1. The board stressed that [Art. 69\(1\) EPC](#) concerned only the extent of protection, which in turn was relevant only for the purposes of [Art. 123\(3\) EPC](#) and in national infringement proceedings. A general requirement that claims be interpreted with the help of the description could not be derived from [Art. 69\(1\) EPC](#). It was nevertheless a general principle that a term could be interpreted only in context. Terms in a claim therefore had to be interpreted in the overall context of the claims set and the description (see also [T.1817/14](#)). Two extremes had to be avoided. On the one hand, limiting features mentioned in the description but not in the claims could not be read into the latter (see in this chapter [II.A.6.3.4](#)). They could not be

inserted this way through interpretation, but only by amending the claims. On the other hand, claims could not be considered in complete isolation from the description. The skilled person interpreting the claim had to at least ascertain whether the expressions used were to be understood in their ordinary literal sense or whether they had a special meaning defined in the description. Likewise, if the claims were obscure, the skilled person had no alternative but to search for clarification both in the other claims and in the description and drawings (see in this chapter [II.A.6.3.3](#)). Using the description to interpret the claims was therefore admissible within certain limits, and sometimes even necessary; there was no need to invoke [Art. 69\(1\) EPC](#).

In [T 1279/04](#) the board did not share the appellant's (patent proprietor's) view that, for the purposes of assessing novelty in opposition proceedings, claims should be interpreted in accordance with [Art. 69\(1\) EPC 1973](#) and the Protocol on its interpretation (see also [T 1047/11](#), [T 1578/13](#)). [Art. 69\(1\) EPC 1973](#) and its Protocol related to the extent of protection conferred by the patent or patent application, which was primarily of concern in infringement proceedings. They served to determine a fair protection – inter alia by reference to the description and drawings – in circumstances where the claim wording was set in stone. By contrast, in examination and opposition proceedings the value of future legal certainty was paramount. In this forum the function of the claims was to define the matter for which protection was sought ([Art. 84 EPC 1973](#), first sentence). There was no case for anything other than a strict definitional approach (for an interpretation of this approach, see [T 1534/12](#)), given that in this procedural stage the claim could and should be amended to ensure legally certain patentability, in particular novelty and inventive step over any known prior art. Amendment rather than protracted argument should be the answer to genuine difficulties of interpretation in all aspects of the examination and opposition procedure, it being acknowledged that amendments to a patent as granted should be occasioned by grounds for opposition. See also [T 145/14](#).

Likewise in [T 1808/06](#) the board emphasised that, when the description has to be amended with regard to the requirement of [Art. 84 EPC](#), it was only in situations where the removal of inconsistencies was not possible for procedural reasons (e.g. no amendment possible of the granted version) that – purely as an auxiliary construction – [Art. 69\(1\) EPC](#) could be invoked for an interpretation of the claimed subject-matter.

See also in this chapter [II.A.6.3.4](#) "Reading additional features and limitations into the claims".

6.3.3 Interpretation of ambiguous terms or confirmation of the text of a claim

Many decisions which use the description and drawings to interpret the claims concern the interpretation of relative, ambiguous or unclear terms or cite the description merely to confirm the most obvious interpretation of the text of a claim (e.g. [T 23/86](#), OJ 1987, 316; [T 16/87](#), OJ 1992, 212; [T 952/90](#); [T 439/92](#); [T 458/96](#); [T 717/98](#); [T 556/02](#); [T 2145/13](#)).

In decision [T 50/90](#) the board pointed out that the description and drawings were used to interpret relative terms contained in the claims when the extent of protection had to be determined.

When the technical content of the claims and the description clearly establish how an invention operates, these features cannot be disregarded for the purposes of assessing patentability by interpreting them merely as defining an intended use (T 458/96).

In several decisions the boards have stated that terms used in patent documents should be given their normal meaning in the relevant art, unless the description gives them a special meaning (see e.g. T 1321/04, T 1089/11, T 25/15). According to the established case law, the patent document may be its own dictionary (see e.g. T 311/93, T 523/00, T 1192/02, T 61/03, T 1321/04, T 1388/09, T 2480/11, T 1817/14; see also in this chapter II.A.6.3.5; as to the limits of this, see T 2221/10). On this basis, the board in T 500/01 held that, a claim, the wording of which is essentially identical to a claim as originally filed, can nevertheless contravene the requirements of Art. 123(2) EPC if it contains a feature whose definition has been amended in the description in a non-allowable way.

In T 1023/02 the invention was based on the recognition that the genes for a specific viral protein (ICP34.5) expressed in infected cells determine the ability of herpes simplex viruses to destroy central nervous system tissue. The respondent argued that a post-published document revealed the existence of an ORF-P gene coincident with but anti-sense to the ICP34.5 gene. Therefore, in view of the term "only", the claim had to be interpreted as requiring that the first method step did not interfere with the expression of this ORF-P gene. The board, however, pointed out that it was apparent from the description that the patentee had not envisaged the existence of this gene. The skilled reader would therefore, in the light of the description, not interpret the subject-matter of claim 1 in the way advocated by the respondent. Accordingly post-published knowledge of further technical details and/or complications could not justify this interpretation.

In T 1409/16 the board considered that both "exclusive disjunctions" and "inclusive disjunctions" could be expressed by the "either (...) or" wording. The fact that another expression ("and/or") was used (in the sense of an inclusive "or") in another claim of the contested patent was not, as such, a compelling reason for concluding that the "either (...) or" wording used in the claim in question must have a different meaning, i.e. that it expressed an exclusive "or". There was no absolute obligation to use a fully coherent terminology for expressing given features if the latter could be expressed in different ways. The board held that the "either (...) or" wording could only be considered as expressing an exclusive "or" in cases where the two situations referred to were, due to their very nature, mutually exclusive, i.e. incompatible with each other.

6.3.4 Reading additional features and limitations into the claims

For the purposes of judging novelty and inventive step, Art. 69 EPC (Art. 69 EPC 1973) and its Protocol cannot be relied on to read into the claim an implicit restrictive feature not suggested by the explicit wording of the claim (T 1208/97, T 681/01, T 881/01, T 1105/04, T 223/05, T 1736/06, T 299/09, T 58/13). In proceedings before the EPO, where the patentee has the opportunity of cutting down his claims to accord with stricter limits given in the description, the scope of a claim should not be cut down by implying into it features which appear only in the description, as this would deprive claims of their intended function (T 881/01).

In T. 932/99 claim 1 was directed to a product per se. The claim defined only the structure of a membrane as such, independently from its installation in an apparatus for gas separation. The board pointed out that, for this reason, the indication in the claim "capable of separating oxygen from oxygen-containing gaseous mixture" merely served the purpose of defining a capability of the claimed membrane, without imparting any limitations on any actual use of the structure claimed. The respondents had argued that, if claim 1 was interpreted in the light of the description, those limitations would be apparent. However, the board held that a distinction had to be drawn between, on the one hand, the fact that it might be necessary to take into account any explicit definition as given in the description for interpreting a claim's term and, on the other hand, the attempt to use Art. 69 EPC 1973 as a basis for reading limitations derived from the description into claims in order to avoid objections based on lack of novelty or inventive step. The latter approach to interpretation, whereby features mentioned only in the description were read into claim 1 as necessary limitations, was incompatible with the EPC (referring to T. 1208/97). See also T. 945/99, T. 2049/07.

In T. 1018/02 the board emphasised that, although a claim must not be interpreted in a way which was illogical or did not make sense, the description could not be used to give a different meaning to a claim feature which in itself imparted a clear, credible technical teaching to the skilled reader. This also applied if the feature had not been initially disclosed in the form appearing in the claim. See also T. 373/01, T. 396/01.

In T. 121/89 the board used the description to interpret an ambiguous term ("loose ignition charge"), but at the same time stressed that only features recited in or deducible from the claims could be set forth to distinguish the invention from the state of the art. The examples cited in the description did not limit the scope of the claims unless they were explicitly mentioned in them. See also T. 544/89.

In T. 416/87 (OJ 1990, 415), on the other hand, the board was confronted with the situation where a feature was not included in the claims which the description on its proper interpretation specified to be an overriding requirement of the invention. The board held that, following Art. 69(1) EPC 1973 and its Protocol, the claims might be interpreted as requiring this as an essential feature, even though the wording of the claims when read in isolation did not specifically require such feature (confirmed in an obiter dictum in T. 717/98). See also T. 620/08, T. 2525/11.

6.3.5 Use in the examination relating to the clarity requirement pursuant to Article 84 EPC

In a large number of decisions (see in this chapter II.A.6.3.1) the boards interpreted the claims in the light of the description and drawings in order to establish whether they were clear and concise.

In T. 456/91 the board was of the opinion that the clarity of a claim was not diminished by the mere breadth of a term of art contained in it, if the meaning of such term was unambiguous for a person skilled in the art, either per se or in the light of the description. In this case an extremely large number of compounds could be used for carrying out the

invention. It was clear from the claims, when read in the light of the description, which peptides were suitable for the invention.

Likewise, in T. 860/93 (OJ 1995, 47) the board assumed that the description might be used to determine whether the claims were clear. In so doing it took its cue from the general legal principle whereby the best interpretation is that made from what precedes and what follows. It accepted the reasoning in T. 454/89 (see below), namely that the description could only be used to determine the extent of the protection conferred and not to establish clarity, only in the case of claims which were self-contradictory, but not in general (see also T. 884/93, T. 287/97). In several decisions the boards stated that a patent may be its own dictionary (see in this chapter II.A.6.3.3).

However, a number of decisions point out the limits to the use of the description and drawings in the examination relating to the clarity requirement.

T. 2/80 (OJ 1981, 431) pointed out that a claim did not comply with the requirement of clarity laid down in Art. 84 EPC 1973 if it was not, per se, free of contradiction. It had to be possible to understand the claims without reference to the description (see also T. 412/03, T. 129/13). In decision T. 454/89 the board shared this view and explained that Art. 84 EPC 1973 requires that claims must be clear in themselves when read using normal skills, including knowledge of the prior art but not any knowledge derived from the description contained in the patent application or the amended patent. While it was true that Art. 69 EPC 1973 allowed the description to be used to interpret the claims, it was only concerned with the extent of protection conferred as one of the effects of an application or patent whenever that extent had to be determined, particularly for third parties. It was not concerned with a claim's definition of the matter for which protection was sought, as was Art. 84 EPC 1973. In the course of the examination of an opposition, therefore, the applicant or patentee could not rely on Art. 69 EPC 1973 as a substitute for an amendment which would be necessary to remedy a lack of clarity. The board took the same line in decision T. 760/90.

In T. 1129/97 (OJ 2001, 273), the board held that the mere fact that the precise meaning of an unclear term ("low alkyl") was expressly disclosed in the description but not in the claims did not mean that the latter met the clarity requirement. The clarity stipulation under Art. 84 EPC 1973 concerned only the claims, and therefore – according to the established case law of the EPO boards of appeal – required that they be clear in themselves, without there being any need for the skilled person to refer to the description. True, under Art. 69(1) EPC 1973 the description was to be used to interpret the claims. But Art. 69 EPC 1973 concerned only the extent of protection where this was at issue, e.g. with third parties, and not (as in Art. 84 EPC 1973) the definition of the matter to be protected by a claim. Confirmed in T. 56/04, T. 64/03, T. 1265/13.

In T. 49/99 the board held that since clarity was a claim requirement, a clarity deficiency in the claim wording was not rectified by the fact that the description and the drawings would help the reader to understand the technical subject-matter that the claim was intended to define. See also T. 623/13.

In T. 56/04 the board pointed out that a claim containing an unclear technical feature prevented its subject-matter from being identified beyond doubt. That was particularly the case if the unclear feature was meant to delimit the claimed subject-matter from the state of the art. The board therefore took the view that a vague or unclear term which was used in the claim and a precise definition which was to be found only in the description could be allowed only in exceptional cases to delimit the claimed subject-matter from the state of the art. Such an exception pursuant – mutatis mutandis – to R. 29(6) EPC 1973 exists if the precise definition – for whatever reason – cannot be incorporated into the claim, and the precise definition of the vague or unclear term is unambiguously and directly identifiable by a skilled person from the description. In T. 56/04 the board said that an exception was not involved. The specific value of "approximately 1 mm" disclosed in the description could have been incorporated into the claim itself instead of "slightly less than [...]". See also T. 623/13.

On the extent to which it must be clear from the claim itself how parameters are to be determined when a product is characterised by parameters, see in this chapter II.A.3.5. In a number of decisions it is stressed that the claims must be clear in themselves when read with the normal skills but without any knowledge derived from the description (see e.g. T. 412/02 and T. 908/04). In T. 992/02 however the board deemed it justified in the case in point for the claim not to include the procedure for measuring the parameter.

6.3.6 Definition of the scope of protection with regard to infringement not within the EPO's competences

In T. 442/91 the respondents wanted the board to rule on the extent of the protection conferred by what they considered to be broad claims. The board observed that the EPO concerned itself in opposition appeal proceedings with the extent of protection conferred by a patent only for the purposes of examining compliance with Art. 123(3) EPC 1973. Beyond that, interpreting the extent of protection was a matter for national courts dealing with infringement cases. Whilst the EPO made it clear how terms of art used in the claims should be understood, it should not proffer any further interpretation of the patent's future scope beyond that (see also T. 740/96). In line with this thinking, the board in T. 439/92 and T. 62/92 interpreted the claims with a view to identifying their subject-matter.

7. Product-by-process claims

7.1. Introduction

Under Art. 64(2) EPC (1973 and 2000) the protection conferred by a process patent extends to the products obtained directly by the process, even if they are not patentable per se. Certain applicants tried to acquire protection for known products by using process claims to define them, arguing that it follows from Art. 64(2) EPC 1973, that a product is rendered novel by the fact that it is produced by means of a new process.

The boards of appeal did not accept this line of argument and made a distinction between claims to a new and inventive product defined by its method of manufacture and claims to

a new and inventive process, the protective effects of which also extended to the direct products of this process.

The first decision in this regard was T 150/82 (OJ 1984, 309). The board stated that claims for products defined in terms of processes for their preparation (known as "product-by-process" claims) were admissible only if the products themselves fulfilled the requirements for patentability and there was no other information available in the application which could have enabled the applicant to define the product satisfactorily by reference to its composition, structure or some other testable parameter (established case law, see e.g. G 2/12, OJ 2016, A28 and G 2/13, OJ 2016, A29; T 956/04; T 768/08; T 150/12).

With regard to product-by-process claims, the requirement of clarity means that the skilled person should be able to determine, either from the claim alone or, by construction of the claim in the light of the description, or by construction in the light of the skilled person's common general knowledge, which identifiable and unambiguous technical features are imparted to the product by the process by which it is defined (T 967/10, T 1988/12). In T 1988/12 the board rejected the idea that the claim was necessarily clear if a skilled person (i.e. a plant breeder) could determine whether or not a candidate plant fell within its terms. The suggestion that the skilled person had to rely on an analysis of a potentially infringing product to know what the subject-matter for which protection was sought actually was, ran counter to the purpose of Art. 84 EPC.

7.2. Requirement that the claimed product must be patentable

In decision T 248/85 (OJ 1986, 261) it was stated that a product could be defined by the use of various parameters, such as its structure or its process of preparation. The use of a different parameter by which to define a particular product could not by itself give the product novelty. Furthermore Art. 64(2) EPC 1973 did not confer novelty upon a claim which was formulated as a "product-by-process" when no novelty existed in such product per se, and did not entitle or enable an applicant for a European patent to include such claims in his patent which did not satisfy the requirements of Art. 52(1) EPC 1973.

In T 219/83 (OJ 1986, 211) the board stated that product-by-process claims had to be interpreted in an absolute sense, i.e. independently of the process. If their subject-matter as such was new, they still did not involve an inventive step merely because the process for their preparation did so. In order to be patentable, the claimed product as such had to be a solution to a separate technical problem which was not obvious in the light of the state of the art.

These criteria were confirmed and applied in many decisions (see e.g. T 251/85, T 563/89, T 493/90, T 664/90, T 223/96, T 59/97, T 748/98, T 620/99, T 1113/10).

The board clarified the conditions for novelty of product-by-process claims in decision T 205/83 (OJ 1985, 363). It stated that the polymer product of a known chemical process was not rendered new merely by virtue of a modification to the process. If a chemical product could not be defined by structural characteristics but only by its method of manufacture, novelty could be established only if evidence was provided that modification

of the process parameters resulted in other products. It was sufficient for this purpose if it was shown that distinct differences existed in the properties of the products. This evidence might not include properties which could not be due to the product's substance parameters. See also T. 279/84, T. 151/95, T. 728/98, T. 564/02, T. 1247/03.

In T. 300/89 (OJ 1991, 480) it was stated that the application lacked novelty if the claim neither defined the product structurally nor mentioned all the specific conditions needed to obtain necessarily the products whose novelty could be demonstrated, e.g. by means of comparative tests. Similarly, in T. 552/91 (OJ 1995, 100) the board ruled that the claim had to include all the process parameters required for unambiguously defining the claimed substances as inevitable process products. As chemical reactions only rarely took one particular course and therefore only rarely led to uniform substances, it was generally necessary to indicate not only the starting materials and reaction conditions, but also the method by which the reaction mixture was processed to obtain the claimed substances. This case law was confirmed in T. 956/04, where the board considered that without clearly indicating the specific starting materials and the specific reaction conditions, the "obtainable-by" features as claimed failed to unequivocally define the claimed catalysts as inevitable process products.

In T. 728/98 (OJ 2001, 319) the board stated that the general rule that the level of purity of a low molecular chemical compound could not entail novelty was also valid in the case of a product-by-process claim where the purity level was the inevitable result of the preparation process indicated in the claim. In the case in hand the appellant (applicant) had not been able to prove the existence of an exceptional situation where all attempts had failed to achieve a particular level of purity by conventional purification methods. See also chapter I.C.6.2.4. "Achieving a higher degree of purity".

In T. 803/01 the board noted that there was no statement whatsoever in T. 205/83 (OJ 1985, 363) which prohibited the presence of parameters relating to impurities in a claim for reasons of clarity. The parameters relating to the purity of the polylactides were technical features in line with R. 29(1) EPC 1973. This was considered to be a relevant criterion for assessing the extent to which the use of purity parameters in a product claim was allowable from the point of view of clarity (G. 2/88, OJ 1990, 93).

In T. 394/03 the board ruled that improved product quality achieved by means of a process did not generally constitute, in a product-by-process claim, a structural feature giving rise to novelty or inventive step. In the case in hand, a decorated ceramic product was claimed which differed from known products of this type only by virtue of its better quality, which had been achieved by means of the process according to the invention.

In T. 564/02, when examining whether the product itself met the requirements for patentability, the board had to deal with the burden of proof. The respondent (opponent) had raised an objection of lack of novelty which was based on the disclosure in an example in a prior art document. The board observed that the validity of this objection rested exclusively on the validity of certain assumptions made by the respondent with respect to parameters of the product disclosed in prior art. In such a case, the concept of the balance of probabilities could not be applied for the assessment of the validity of each assumption;

it had to cede to a stricter criterion close to absolute conviction. In other words, there should be a degree of certainty which is beyond reasonable doubt.

7.3. Requirement that the claimed product cannot be described in any other way

The criterion laid down in T.150/82 (OJ 1984, 309), whereby it must be impossible to define the claimed product other than in terms of a process of manufacture is now established case law (see e.g. T.333/93, T.749/95, T.950/97, T.1074/97, T.933/01, T.150/12, T.863/12).

In T.320/87 (OJ 1990, 71) the board stated that product-by-process claims were admissible for hybrid seeds and plants when they were not individually definable biological entities which could be characterised by their physiological or morphological features.

In T.130/90 the board had to rule on recombinant monoclonal antibodies having two different specificities and produced by a process involving trioma cells or quadroma cells and thus producing antibodies in a native form. The patentability of the process was not questioned. The process known from prior art chemically recombined antibody half-molecules. At issue was the validity of the product claim. The prior art did not disclose how fully re-associated molecules, i.e. with the same structure as native antibodies, which might be contained in the mixture of hybrids, could be screened out and isolated from molecules which were chemically altered. The board allowed a claim for bispecific recombinant monoclonal antibodies comprising intact immunological chains produced by the process claimed in the independent process claims of the patent in suit. Defining the antibodies by their process was the only way of delimiting them vis-à-vis the prior art.

In T.552/91 (OJ 1995, 100) it was held that where a European patent application relates to chemical substances originally defined by an incorrect chemical structural formula, correction of which is not allowable under R. 88 EPC 1973, replacement of the incorrect formula by the correct one infringes Art. 123(2) EPC 1973. Nevertheless, the submission of a "product-by-process" claim is compatible with Art. 123(2) EPC 1973 if it contains all the measures required to obtain this result (starting materials, reaction conditions, separation).

7.4. Applicability of the principles for product-by-process claims to use claims

In T.81/14 the board held that when considering the definition of a product in terms of its production process the principles developed in the jurisprudence for the product-by-process claims are in general to be applied, also in the case of a claim directed to the use of that product. Claim 1-7 of one of the auxiliary requests were directed to a method of producing a sintered cemented carbide body. Claim 8 was directed to the use, for the production of a cutting tool, of a sintered cemented carbide body obtained according to the method of any one of claims 1-7. Hence, claim 8 comprised process and product features and was notionally equivalent to a claim directed to a process for the production of a cutting tool using the sintered cemented carbide body. Although the claim was not directed to a product but to a process, the board stated that the principles underlying the assessment of the clarity of product features should not depend on whether such product

features appear in a claim directed to a product or in a claim directed to a process. Applying the principles developed in the jurisprudence for product-by-process claims to claim 8, the board stated it would have been possible to define the sintered body in terms of structural features. Accordingly, the use of a product-by-process definition in claim 8 resulted in a lack of clarity.

7.5. Combination of product and process features

In decision T.148/87 the board stated that it was admissible to combine product parameters and process parameters in the same claim. In T.129/88 (OJ 1993, 598) the board was of the opinion that the inclusion in a product claim of one or more process features might be permissible if their presence was desirable having regard to the impact of the national laws of one or more contracting states (see also T.592/95, T.288/02). See also in this chapter II.A.3.7.

7.6. Extension of protection conferred by product-by-process claims

In T.411/89 the board had to decide whether the amendment of a product-by-process claim from "obtained" to "obtainable" extended the protection conferred by the patent. The board took the view that the protection was not extended because the amendment did not modify the definition of the product which was claimed per se from the beginning and because the process used for its characterisation remained the same.

In T.423/89, by restricting the claim to only one of a number of manufacturing processes specified in the original claim and disclosed in the description, the patent proprietors had ceased to claim absolute product protection and had undertaken a significant limitation of their claim. There were therefore no objections under Art. 123(3) EPC 1973. The change in category from a product-by-process claim to a manufacturing process claim was also admissible in this case, as the protection afforded by the granted patent had to extend to all those methods of manufacture covered by the processes described in the claim and disclosed in the patent specification.

In T.20/94, however, objections under Art. 123(3) EPC 1973 led to the board's refusing a change from process claims to a product-by-process claim by way of amendment, as despite the fact that a product-by-process claim was characterised by the process for its preparation, it nevertheless belonged to the category of claim directed to a physical entity and was a claim directed to the product per se. The scope of protection conferred by a product claim exceeded the scope conferred by a process claim under Art. 64(2) EPC 1973. See also chapter II.E.2.6. "Change of claim category".

8. Claims fees

Until 31 March 2008, under R. 31(1) EPC 1973 and then the new R. 45 EPC, any European patent application comprising more than ten claims incurred payment of a claims fee in respect of each claim over and above that number. With effect from 1 April 2008 the number of fee-exempt claims was increased to fifteen. For international applications

entering the European phase the corresponding provisions are R. 110 EPC 1973 and R. 164 EPC.

The Legal Board ruled in case J 9/84 (OJ 1985, 233) that R. 31(1) EPC 1973 was to be interpreted as meaning that claims numbered 1 to 10 upon filing of the European patent application – or transmittal to the EPO of the international application under the PCT – were exempt from fees, and that claims numbered 11 onwards were not. Accordingly, abandoning a fee-exempt claim after filing – or transmittal – did not have the effect that its fee exemption was transferred to another claim.

8.1. Number of claims

The question has arisen on a number of occasions as to whether part of, or an annex to, the description of a European patent application comprising a series of numbered paragraphs drawn up in the form of claims should be regarded as claims for the purposes of R. 31(1) EPC 1973.

In J 5/87 (OJ 1987, 295) the application contained, under the heading "Claims", ten claims; however it contained 33 further claims which were annexed to the description as preferred, numbered embodiments presented in the form of claims. The addendum appeared in form as well as in substance only to consist of claims within the meaning of Art. 84 and R. 29 EPC 1973. Furthermore, the appellant had admitted that the addendum had been included in the application in order to maintain the possibility of making its content a basis for substantive examination. As a result, the applicant was required to pay the claims fee – applicants were not at liberty to ignore the provisions on the form and content of the description and claims contained in R. 27 and R. 29 EPC 1973.

In J 15/88 (OJ 1990, 445) the Legal Board decided in a similar case that although the 117 disputed "clauses" in question were numbered and arranged as claims and seemed to define matter in terms of technical features, they were not to be regarded as such since the fact remained that they were never referred to as claims and there were claims elsewhere which were referred to as such.

Decisions J 16/88, J 29/88, J 25/89, J 26/89, J 27/89, J 28/89, J 34/89 and T 490/90 all confirmed this opinion, pointing out that the case dealt with in J 5/87 differed from the others since the applicant had indicated an intention to regard the annexes as claims. The intention of the appellant not to have this part considered as claims is more important than the form of the text.

8.2. Temporary change in the number of claims

Pronouncing in J 11/12 on the legal situation before the entry into force of the 1 January 2017 version of R. 162(2) EPC, the Legal Board held that an additional fee was not generally payable when the number of claims was increased after entry into the European phase unless R. 71(4) EPC came into play just before grant. A temporary increase in the number of claims to be examined had no consequences in terms of costs

to the applicant. The same applied to Euro-direct applications once any claims fees under R. 45 EPC were paid.

8.3. No refund of claims fees

In J. 3/09 the Legal Board rejected the appellant's request for a refund of the claims fee for claims 16-68 and noted that the legal basis for payment of those claims was R. 110(1) EPC 1973. It added that fees, once validly paid, were not refundable unless provision to the contrary was made (see also J. 11/12). The appellant had not relied on any specific provision of the EPC in its support. In response to the appellant's argument that it was inevitable that the subject matter of the unsearched claims could not be prosecuted in the application, and had therefore to be considered as abandoned, the board noted *inter alia* that in the frequent case of an a posteriori objection of non-unity, even if justified, the claims could usefully serve as a basis for later limiting the claimed subject-matter to a more specifically defined but now unitary and searched invention. Whilst the extent to which this was possible depended on the circumstances of the individual case, it remained the position that the payment of claims fees for claims exceeding the number of ten could have a useful purpose on its own independently of the question whether all the claims concerned unitary subject-matter.

B. Unity of invention

1. Introduction

Under Art. 82 EPC, the European patent application must relate to one invention only or to a group of inventions so linked as to form a **single general inventive concept**. R. 44(1) EPC (cf. R. 30 EPC 1973) gives an interpretation of the concept of unity of invention where a group of inventions is claimed. The principles set out by board of appeal case law relating to the earlier version of R. 30 EPC 1973 in force until 31.5.1991 can still be applied.

For international applications the corresponding provisions on unity of invention are Art. 3(4)(iii) and in particular R. 13 PCT. Protests in respect of additional fees paid following a non-unity objection by the EPO acting as ISA (Art. 17(3)(a), R. 40 PCT) or as IPEA (Art. 34(3)(a), R. 68 PCT), which were previously decided on by the boards of appeal (Art. 154(3) and 155(3) EPC 1973), are now decided on by review panels of the EPO (R. 158(3) EPC, Decision of the President of the EPO, OJ 2015, A59; for the interim procedure applied between the entry into force of amended R. 40 and 68 PCT on 1.4.2005 and of the EPC 2000 on 13.12.2007, see Notice of 1 March 2005, OJ 2005, 226, and the

"Case Law of the Boards of Appeal", 6th edition 2010, IX.A.1). The boards' competence to consider unity in the context of European applications remains unaffected. Given the harmonisation of the definitions concerning unity of invention in R. 13 PCT and Art. 82, R. 44 EPC, the criteria for unity in both systems are the same. Therefore, decisions of the boards of appeal rendered according to the former PCT protest procedures continue to be of interest for the consideration of unity in European applications.

Concerning procedural aspects of the assessment of unity, see R. 64 and 164 EPC (cf. also Art. 17(3)(a), R. 40 PCT; Art. 34(3)(a), R. 68 PCT) and also in this chapter II.B.3. and II.B.6.

The Guidelines for Examination in the EPO (November 2018 version) deal with unity of invention at the search stage in Part B-VII, unity as a procedural aspect of substantive examination in Part C-III, 3, and unity as a requirement of the European patent application in (extensively revised) Part F-V. For international applications see especially Chapter 10 of the PCT International Search and Preliminary Examination Guidelines, as in force from 1.1.2019, and the Guidelines for Search and Examination in the EPO as a PCT Authority, B-VII, C-V and F-V – November 2018 version.

2. Unity in the context of different types of claims

2.1. Plurality of independent claims

Under Art. 82 EPC, as under R. 13.1 PCT, the application must relate to one invention only or to a group of inventions so linked as to form a single general inventive concept. The second alternative, i.e. the single-concept linked group, may give rise to a plurality of independent claims in the **same or different categories** (see also R. 43(2) EPC).

In W 5/92 the board considered it to be implicit in the definition of R. 13.1 PCT that the "invention" be considered in the broadest sense. Thus, according to the former PCT Search Guidelines VII-5 (PCT Gazette No. 30/1992, Sec. IV; No. 29/1993, Sec. IV), the mere fact that an international application contained claims of different categories or several independent claims of the same category was in itself no reason for objection on the grounds of lack of unity (see now guidance in para. 10.01 ff. PCT International Search and Preliminary Examination Guidelines, as in force from 1.1.2019).

R. 44(1) EPC and R. 13.2 PCT provide that where a group of inventions is claimed in a European/international application, the requirement of unity of invention is fulfilled only when there is a technical relationship among those inventions involving one or more of the same or corresponding special technical features.

The former R. 30 EPC 1973 as in force until 31.5.1991, like the previous R. 13 PCT, specified the following three cases in which a combination of independent claims in different categories was to be considered as having unity in the above-mentioned sense:

(a) in addition to a claim for a given product, a claim for a process specially adapted for the manufacture of the product, and a claim for a use of the product;

(b) in addition to a claim for a given process, a claim for an apparatus or means specifically designed for carrying out the process;

(c) in addition to a claim for a given product, a claim for a process specifically adapted for the manufacture of the product, and a claim for an apparatus or means specifically designed for carrying out the process.

The list was not exhaustive and other combinations were permitted if they met the requirements of Art. 82 EPC 1973 (T. 861/92). The same applied to the old version of R. 13.2 PCT (W 3/88, OJ 1990, 126; W 29/88, W 3/89). In T. 702/93 it was held that this version of R. 30 EPC 1973 did not provide for such a fictitious unity in the case of independent claims in the **same** category.

While this fiction was removed with the amendment of R. 30 EPC 1973 and R. 13 PCT (with effect from 1.6.1991), the principles based on it, as set out in the above case law, remain unchanged (T. 169/96).

In T. 202/83 it was concluded from the old version of R. 30(c) EPC 1973 that the requirement of unity was not met by every subject-matter for carrying out a process. On the contrary, the provision presupposed that the means for carrying out the process had been specifically designed. Consequently, such a means in connection with the corresponding process did not meet the unity requirement if it was obvious that it could also serve to solve other technical problems.

In T. 200/86 the board held that it was possible to claim, in one application, not only a product for pharmaceutical use, but also the product's non-therapeutic (cosmetic and dietary) uses.

In W. 29/88 the international application related to chemical products, a process for their preparation and their use. The board was of the opinion that a particular use of a class of compounds on the one hand, and, on the other hand, a claim to that class of compounds per se or to certain members of that class of compounds could form a single general inventive concept. The board stressed that the salient point was not the identity of the respective structural scopes, but the question whether the compounds claimed per se (and the process for their manufacture) contributed to the solution of the problem underlying the use invention.

In W. 32/88 (OJ 1990, 138) the board was of the opinion that an invitation to pay an additional search fee on the grounds that an international application concerning a process and an apparatus related to two different inventions, whereas the apparatus was specifically designed for carrying out the process, had no legal basis, even if the claims for the apparatus were not restricted to such use (see also W. 16/89).

In W. 13/89 the board found unity between a claim to the use of a substance or composition for the preparation of a medicine intended for a specific use (second medical use) and a claim to a pharmaceutical product containing that substance or composition (first medical use). This decision was confirmed in W. 5/91 and W. 28/91.

In W 23/91, the board confirmed the ISA's view that the novelty of a given product might justify claims of different categories being contained in a single application without contravening the requirements of unity (several new uses of the product in different areas and/or new processes concerning the product, e.g. preparation). In the case in point, the two independent product claims related to two "products", namely a nucleic acid sequence and the protein relating to the nucleic acid sequence. The board held that these products might constitute the common link if they were novel.

In W 40/92 the board took the view that there can be unity of invention if one independent claim to a process and another to the means for executing that process were comprised in one application. Said means could itself also be a process.

In T 492/91, the board found that, for the purposes of Art. 82 EPC 1973, the whole composition covered by claim 6 (new composition) need not be the product of the process according to claim 1 (process for preparing known products). It was sufficient for one component of the composition to be such a product where the composition and the process were intended to solve the same technical problem. The board concluded that the scope of claim 6 therefore did not have to be limited to the compositions resulting from the process according to claim 1, thus excluding the compositions obtainable by subsequent mixing.

In J 13/13 the Legal Board recalled that R. 43(2) EPC and R. 44 EPC govern two distinct matters: R. 43(2) EPC must be complied with even where a patent application claims and describes a group of inventions that form a single general inventive concept, while R. 44 EPC must be complied with even where only a single independent claim is drafted for each claim category.

2.2. Dependent claims

R. 13.4 PCT expressly provides that dependent claims must fulfil the requirement of unity in accordance with R. 13.1 PCT. The EPC makes no comparable express provision. The question has therefore arisen whether dependent claims have to be treated differently under the two provisions. Board of appeal case law on PCT cases has been uniform: the boards have repeatedly confirmed the principle that the requirement of unity must also be met by dependent claims (see inter alia W 3/87, W 2/88, W 30/89, W 32/89, W 26/90, W 8/91 and W 54/91). In EPC cases the boards likewise assume that dependent claims have to meet the requirement of unity. Under the EPC the approach is not as strict as in the case of independent claims, where the examination is always carried out in accordance with the express requirement, but only in those cases where unity could be problematical (see T 140/83 and T 249/89).

In W 8/91 it was decided that, where claims were formally dependent, the ISA had to state expressly why they lacked unity; it was not enough simply to say that this was shown directly by the subject-matter as defined by the ISA.

In W 6/98 the board held that anticipation of the subject-matter of an independent claim might well lead to a situation of non-unity a posteriori, which however could only be

established by showing that there was indeed no unifying novel inventive concept common to all dependent claims. The board noted that lack of novelty of the subject-matter of an independent claim did not automatically lead to a posteriori lack of unity for the claims directly or indirectly appended to said independent claim.

The board in T.129/14 pointed out that, normally, a dependent claim has all the features of its independent claim. If the independent claim comprised one or more special technical features defining a contribution over the prior art, the dependent claim would also comprise them. Hence they would form a single general inventive concept within the meaning of Art. 82 EPC. If the independent claim did not comprise any special technical features defining a contribution over that prior art, e.g. because its subject-matter was not novel, then it would not form any inventive concept. Hence, again no more than one general inventive concept within the meaning of Art. 82 EPC – possibly defined by the additional features of the dependent claim – would result (cf. Guidelines F-V, 9 – November 2015 version; see now Guidelines F-V, 2.1, 4.2, 5 – November 2018 version).

2.3. Intermediate products

In T.57/82 (OJ 1982, 306) it was stressed that the subject-matter of an application relating to new chemical end products, processes for their preparation, and to new intermediates for those end products at all events had unity within the meaning of Art. 82 EPC 1973 if all these subject-matters were technically interconnected and integrated into a single overall concept by being oriented towards the end products. In this context, starting materials which were used in a process for preparing end products and which were themselves products of a disclosed, albeit unclaimed, production process were also considered to be intermediates. This principle was confirmed in T.110/82 (OJ 1983, 274) for low-molecular products. According to that board, an invention relating to new low-molecular end products and to several groups of new low-molecular intermediates invariably had unity if the groups of intermediates prepared and oriented towards the end-products were technically closely interconnected with the end products by the incorporation of an essential structural element into the end-products and if due account was taken of the regulatory function of Art. 82 EPC 1973 (prohibition of unjustified saving of fees, need for ready comprehensibility).

This was confirmed by T.35/87 (OJ 1988, 134) and T.470/91 (OJ 1993, 680). The intermediates in the latter case – unlike those in earlier ones – were not structurally related to each other. However, they provided both the essential structural elements present in the end products. The intermediates of the application were therefore only made available with a view to obtaining the end products and they were sufficiently closely technically interconnected with those end products. Thus, they were integrated into a single overall inventive concept by being oriented towards the end products. This was not prejudiced by the fact that the two sets of intermediates were not structurally related to each other since the orientation of the intermediates towards the end products permitted the individual technical problems addressed by the intermediates to be combined into a unitary overall problem to the solution of which both sets of purpose-made intermediates contributed.

In W 35/91 the board ruled that the requirements of unity of invention as set out in R. 13.1 and R. 13.2 PCT were met if the novel intermediates designed to give rise to the novel end products were technically sufficiently closely related by their contribution to an essential structural element of the end products.

In W 7/85 (OJ 1988, 211) the board stated that there was sufficient technical information to justify a prima facie finding of unity between a claim to a mixture and a claim to one essential component of that mixture or a narrowly defined version thereof. If a finding of unity was justified in cases of chemical intermediates and end products even when, as was often the case, only a part of the intermediate structure was actually incorporated, there was all the more reason to view the intact components and the corresponding compositions in a mixture as technically interconnected by incorporation. The former were not even destroyed when the admixture was prepared and fully retained their properties and functions in the product, unlike typical intermediates, which lost their identity in the process. Thus, both inventions could be considered to fall within the same general inventive concept. In such cases the requirement that the means for preparing the end product should be "specially designed for carrying out the process" appeared to be fulfilled since none of the means led or was related to an end product outside the scope of its definition. In view of this the character of the invention in the component was, prima facie, also dependent on the existence of an invention in the end product.

3. Assessing lack of unity of invention

3.1. General approach – content of claims

According to Art. 3(4)(iii) PCT, an international application must comply with "the prescribed requirement of unity of invention", the details of which are set out in R. 13 PCT. In the EPC, the requirements for unity are laid down in Art. 82 EPC and R. 44 EPC.

In W 6/97 it was held that the determination of unity of invention must be made on the basis of the contents of the claims as interpreted in the light of the description and of the drawings, if applicable. The board referred to Annex B, Part 1(b) of the PCT Administrative Instructions (cf. now Annex B, para. (b) PCT Administrative Instructions, as in force from 1.1.2019), which stated that principle, and noted that the PCT Administrative Instructions were binding not only on the ISA but also on the board of appeal (when formerly) acting as the "three-member board" according to R. 40.2(c) and (e) PCT (see G 1/89, OJ 1991, 155; since 1.4.2005, the references in the PCT Regulations to "three-member board" have been replaced by "review body" – see also in this chapter II.B.1. "Introduction").

In W 39/90 the board observed that it was not the formal choice of words or form of reference, but the actual content of the claims which established technical relationships between the subject-matter of different claims, and which was thus decisive for the question of unity. In W 33/92 the board emphasised that R. 13.1 PCT did not require the link between the subject-matter of the two independent claims to be expressly stated in their wording. All that was required was that there be a single inventive concept.

In G 1/89 (OJ 1991, 155), the Enlarged Board of Appeal pointed out that neither in the PCT itself nor in the Rules under the PCT were there provisions indicating how to decide whether or not an international application complies with the prescribed requirement of unity of invention. However, the PCT Search Guidelines stated, inter alia, that lack of unity may be directly evident "a priori", that is before considering the claims in relation to any prior art, or may only become apparent "a posteriori", that is after taking prior art into consideration (see now para. 10.03 PCT International Search and Preliminary Examination Guidelines as in force from 1.1.2019). See also next section.

3.2. Assessment of lack of unity at the search stage

Lack of unity may be directly evident a priori, i.e. before examination of the merits of the claims in comparison with the state of the art revealed by the search (W 1/96 and W 6/90, OJ 1991, 438). If the objection of lack of unity is raised a priori, the technical problem must be defined solely on the basis of the description and not of the prior art (see W 50/91, W 52/91, W 22/92, W 52/92 and T 188/04).

On the question whether the International Searching Authority (ISA) had the power to assess unity of invention in an international application a posteriori, i.e. after taking into account the prior art brought to light by the search, the board in W 3/88 (OJ 1990, 126) answered in the negative, interpreting the expression "a single general inventive concept" in R 13.1 PCT as being simply the general concept of what the applicant subjectively claimed to be his invention. By contrast, in W 44/88 (OJ 1990, 140) and W 35/88, the answer was affirmative. In the latter cases the boards referred to the PCT Search Guidelines, which permitted assessment of unity a posteriori. These conflicting interpretations gave rise to referrals under Art. 112 EPC 1973 by a board of appeal (W 12/89, OJ 1990, 152) and by the President of the EPO.

The referred questions, dealt with in consolidated proceedings, were answered in G 1/89 (OJ 1991, 155) and G 2/89 (OJ 1991, 166) respectively. According to the Enlarged Board, the EPO in its capacity as an ISA might, pursuant to Art. 17(3)(a) PCT, request a further search fee where the international application was considered to lack unity a posteriori. The Enlarged Board first noted that the problems involved were mainly due to the fact that, under the PCT, as well as under the EPC 1973, search and (substantive) examination were carried out in sequentially different steps and by different examiners. This procedural separation of search and examination led inevitably to a certain overlapping because of the functional relationship between search and examination. Thus, although the objective of the search was in principle limited to discovering and reporting on relevant prior art for the purpose of assessing novelty and inventive step, which was ultimately the task of the examining authority (i.e. the IPEA and/or the designated Office under the PCT and the examining division under the EPC 1973 respectively), it was obvious that in many instances the search examiner needed to form a provisional opinion on these issues in order to carry out an effective search. Otherwise, he would simply be at a loss how to judge the relevance of the documents in the prior art and how to arrange the search report accordingly. (See also in this chapter II.B.4.2.)

The Enlarged Board further noted that the requirement of unity of invention under the PCT applied equally to the procedure before the ISA and to the procedure before the IPEA according to Art. 17(3)(a) and 34(3)(a) PCT respectively, which was in conformity with the procedural separation of search and examination as referred to above and reflected the principle that the normal fees for search and examination were related to one invention (or a single general inventive concept) only. This led to the conclusion that the requirement of unity of invention under the PCT had in principle to be judged by the same objective criteria by both the ISA and the IPEA.

The Enlarged Board observed that the PCT Search Guidelines contained a direct reference to the consideration of unity by the ISA on an a posteriori basis, i.e. after an assessment of the claims with regard to novelty and inventive step in relation to the prior art. A comparison with the corresponding EPO Guidelines showed that under the EPC 1973 it was also clearly foreseen that consideration of unity by the search divisions might be carried out on an a posteriori basis (see also R. 46 EPC 1973; now R. 64 EPC). In the view of the Enlarged Board, this was a consequence of the special structure of the PCT and the EPC 1973. Therefore, the Guidelines had on this point to be considered as consistent with the PCT and the EPC 1973. As to the PCT Search Guidelines, it was noted that such guidelines were based on Art. 56 PCT dealing with the task of the Committee for Technical Cooperation (see in particular Art. 56(3)(ii) PCT and the reference to the need for uniformity of, inter alia, working methods; see now Chapter 10 of the PCT International Search and Preliminary Examination Guidelines, as in force from 1.1.2019).

According to the board in W 21/89, since, under the terms of R. 33.1(a) PCT, the prior art consisted of everything that had been made available to the public before the date of filing of the international application, the ISA could use such documents as grounds for a decision of lack of unity a posteriori even if it was not possible to cite these documents against a corresponding national patent application in one of the contracting states designated.

The principle whereby the EPO may also find a lack of unity "a posteriori" when carrying out an international search (G 1/89, OJ 1991, 155; G 2/89, OJ 1991, 166) applies equally to a European search because in both cases the searches and search reports are virtually identical (see T 87/88, OJ 1993, 430).

In W 2/10 the board pointed out that in W 4/85 (OJ 1987, 63) and many subsequent decisions, the boards had decided that the requirement to give reasons in an invitation under Art. 17(3)(a) PCT was so fundamental that an unsubstantiated invitation could be regarded as legally ineffective. This was so in the case in question and therefore the additional search fees had to be refunded.

3.3. Assessment of lack of unity and of requests for refund of further search fees in examination proceedings

The requirement of unity under Art. 82 EPC has to be satisfied not only by the patent application as filed but also at later stages of the patent granting procedure, i.e. before the examining division, up until grant of the patent. R. 64(2) EPC (R. 46(2) EPC 1973) refers

to the possibility that the examining division might disagree with the search division concerning lack of unity and that the examining division's opinion is decisive in that the latter may order the refund of any further search fee at the applicant's request. It lies within the discretion of the examining division to decide that a patent application lacks unity of invention within the meaning of Art. 82 EPC, even if the search division did not raise a similar objection under R. 64(1) EPC (R. 46(1) EPC 1973) (T. 178/84, OJ 1989, 157). See also in this chapter II.B.6.

According to T. 94/91, Art. 82 EPC 1973 clearly provided that European patent applications must satisfy the criteria of unity of invention without any restriction. There was no difference in the EPC 1973 between "a priori" and "a posteriori" lack of unity. It was of no importance whether the non-unity appeared immediately or only in view of a document found during the search or the examination.

In T. 544/88 (OJ 1990, 429) the board ruled that if an applicant, in response to an objection of lack of unity under Art. 82 EPC 1973, filed new claims allegedly relating to an invention meeting the unity requirement, examination should be continued even if the other application documents had not been limited to the subject-matter of those claims. However, the examining division might request the applicant to bring the description and drawings into line with the valid claims (R. 27(1)(d) EPC 1973 as in force until 31.5.1991; cf. subsequent R. 27(1)(c) EPC 1973, now R. 42(1)(c) EPC) and to delete from the patent documents those parts of the description and drawings which did not refer to claimed inventions (R. 34(1)(c) EPC 1973). It would then be necessary to check in each individual case whether such adjustments ought to be deferred until allowable claims were submitted.

In J. 24/96 (OJ 2001, 434) the board held that within the framework of R. 46 EPC 1973 it was the task of the examining divisions (and the boards of appeal) to examine whether communications of the search divisions under R. 46(1) EPC 1973 asking for further search fees were justified. R. 46(2) EPC 1973 did not, however, refer to any acts of the search divisions other than communications issued under R. 46(1) EPC 1973. It was therefore not necessary for an examining division to deal in a decision under R. 46(2) EPC 1973 with other objections raised by the applicants in connection with the search, such as the objection that the partial search report was not drawn up in accordance with the Guidelines. The board observed that the examining divisions of course have the possibility of arranging for an additional search to be performed, if they consider a search report delivered by the search division incomplete, but that this had nothing to do with a formal decision issued under R. 46(2) EPC 1973 concerning the refund of further search fees upon request.

In T. 188/00 the board pointed out that the review by the examining division under R. 46(2) EPC 1973 had to be carried out having regard only to the facts presented by the search division in its communication under R. 46(1) EPC 1973. Since in most cases objections against lack of unity were raised having regard to the prior art (a posteriori unity objections), this meant that the examining division had to base its review solely on the documents cited in the partial search report and on the specification of the different inventions drawn up by the search division, while taking into account any arguments which

the applicant might have submitted in support of his request for a refund. Concerning the analogous protest procedures under the PCT (R. 40.2(c) and (e) and R. 68.3(c) and (e) PCT), the boards of appeal had ruled that these reviews had to be based exclusively on the reasons given in the invitation to pay additional fees, having regard to the facts and arguments submitted by the applicants (W 4/93, OJ 1994, 939). However, in the case in hand the examining division had reasoned that the claims as filed lacked unity a posteriori as a consequence of the finding that claim 1 as filed lacked an inventive step having regard to documents D1 and D4, where the latter document was not cited in the partial search report. Thus the examining division did not review the finding of lack of unity of invention within the meaning of R. 46(2) EPC 1973, but carried out a fresh examination on the basis of a new document D4. The board therefore held that the decision to refuse the refund of a further search fee had to be set aside for formal reasons alone and that the appellant's request for a refund of a further search fee under R. 46(2) EPC 1973 was justified.

In the order of its decision on a requested refund of (further) search fees, the examining division must clearly specify the request which has been decided on, the extent to which it grants that request and orders a refund, and the outcome for any remaining parts of the request. Allowing a separate appeal against its interlocutory decision under Art. 106(2) EPC is a constitutive decision of the examining division which establishes the possibility of challenging the interlocutory decision by way of an appeal, and therefore it too should be included in the order (T 756/14).

3.4. No assessment of lack of unity in opposition proceedings

In G 1/91 (OJ 1992, 253) the Enlarged Board held that unity of invention did not come under the requirements which a European patent and the invention to which it related had to meet under Art. 102(3) EPC 1973 (Art. 101(3)(a) EPC) when the patent was maintained in amended form. It was consequently irrelevant in opposition proceedings that the European patent as granted or amended did not meet the requirement of unity. It was clear from the "travaux préparatoires" not only that lack of unity was deliberately excluded as a ground for opposition, but also that any lack of unity arising during opposition proceedings as a result of amendment of the patent had to be accepted.

The Enlarged Board noted inter alia that although unity of invention under Art. 82 EPC 1973 was a material requirement, it was still merely an administrative regulation. It served a number of administrative purposes, particularly in demarcating the respective responsibilities of the departments. The administrative purposes of unity were fulfilled in the main up to the time the patent was granted. The purpose and intention of opposition proceedings was to give a competitor the opportunity of opposing unjustified protective rights. Since this served the competitor's interests, he did not also need to be given the opportunity of contesting a patent on the ground of lack of unity. Lack of unity did not in fact rule out patent protection; it could only result in an application being divided to produce two or more patents. See also T 830/11.

4. Criteria for determining lack of unity

4.1. Determination of the technical problem

According to the established case law of the boards of appeal, determining unity of invention requires as a precondition an analysis of the technical problem or problems underlying the respective group of inventions (see W 11/89, OJ 1993, 225; W 6/97, T 188/04), i.e. whether or not the subject-matter claimed as the solution to such a problem represents a single general inventive concept (see W 6/91; also T 2248/12 and T 129/14). The disregard of this principle would be in itself sufficient justification for the reimbursement of the additional search fees. In W 8/94 the board held that a discussion of the problem underlying the claimed subject-matter was required, because only then was it possible to decide whether or not a common special technical feature within the meaning of R. 13.1 and R. 13.2 PCT existed for different embodiments (see W 11/89, OJ 1993, 225; W 14/89, W 59/90, W 14/91, W 17/91).

In W 6/97 the board found that establishing the technical problem underlying a claimed invention or group of inventions in relation to the state of the art should start, as a rule, from what was considered in the description as having been achieved by the claimed invention, since claims directed to compositions of matter at least were normally silent on the technical effects to be achieved by such compositions. As soon as the search revealed prior art which was clearly more relevant than that already acknowledged in the description of the international application, it was necessary to determine what was to be considered as the particular technical problem in view of both the disclosure of the international application as a whole and the prior art thus revealed (see W 6/91). Unity of invention might be assessed only after the technical problem had been determined in such a manner.

The boards have on several occasions stressed that an alleged lack of clarity in a claim cannot be used as a reason for an objection based on lack of unity (see W 31/88, OJ 1990, 134; W 7/89, W 59/90, W 9/02). In W 21/04 the board observed that according to the established case law of the boards of appeal the features of an independent claim that the ISA held not to meet the requirements of Art. 6 PCT could not be disregarded in examining a lack of unity objection.

In W 17/03 the board was concerned with the investigation of technical relationships for unity. The case is summarised in this chapter II.B.4.2. below.

4.2. Examination as to novelty and inventive step

In W 12/89 (OJ 1990, 152) the board referred, inter alia, the following questions to the Enlarged Board of Appeal:

"Does an International Searching Authority have the power to carry out a substantive examination of an international application in respect of novelty and inventive step when considering under Art. 17(3)(a) PCT whether the application complies with the requirement of unity of invention set forth in R. 13.1 PCT?"

If an International Searching Authority does have such power, in what circumstance does it have an obligation to carry out such a substantive examination?"

The Enlarged Board of Appeal delivered its decision in G 1/89 (OJ 1991, 155; see also the opinion given by the Enlarged Board in G 2/89, OJ 1991, 166, in response to a related referral by the President of the EPO). It found that in accordance with normal terminology, the term "examination" or "substantive examination" referred to the activities of the authorities responsible for deciding on patentability, such as the examining division of the EPO, or, in the case of the PCT, to the activities of the IPEA and/or the designated Office. Obviously, an ISA did not have any power to carry out such activities. The Enlarged Board held that an ISA might only form a provisional opinion on novelty and inventive step for the purpose of carrying out an effective search. This opinion was in no way binding on the authorities referred to above. The same principle applied also when an ISA considered that an international application did not comply with the requirement of unity of invention set forth in R. 13.1 PCT on an "a posteriori" basis. Such consideration had only the procedural effect of initiating the special procedure laid down in Art. 17 PCT and R. 40 PCT and was, therefore, not a "substantive examination" in the normal sense of that term. According to the decision an assessment of whether a single general inventive concept existed was to be undertaken only in so far as this was necessary to establish whether the invention complied with the requirement of unity when implementing the procedure laid down in Art. 17 PCT and R. 40 PCT. Such an assessment was **provisional** and did not constitute a substantive examination in the sense of an examination as to patentability (see W 6/90, OJ 1991, 438).

The Enlarged Board further noted that consideration by an ISA of the requirement of unity of invention should, of course, always be made with a view to giving the applicant fair treatment and that the charging of additional fees under Art. 17(3)(a) PCT should be made only in clear cases. In particular, in view of the fact that such consideration under the PCT was being made without the applicant having had an opportunity to comment, the ISA should exercise restraint in the assessment of novelty and inventive step and in borderline cases preferably refrain from considering an application as not complying with the requirement of unity of invention on the ground of lack of novelty or inventive step (see W 24/90, W 23/91, W 43/91). In W 1/97 the board held that there was no such clear case where the ISA, having already searched part of the subject-matter, was still not in a position to identify several separate inventions.

Following the Enlarged Board's conclusions in G 1/89 and G 2/89, the boards repeatedly used a lack of novelty or inventive step in the general inventive concept underlying the invention to justify a finding of lack of unity (see W 17/89, W 27/89, W 18/90 and W 19/90). In W 10/92 the board stressed that the problem-solution approach was to be applied to unity of invention (W 16/91, W 21/91).

In W 17/03 the ISA had considered that the absence of common technical features and an allegedly different problem solved would be sufficient to demonstrate lack of unity between groups of inventions. The board suggested that the ISA's approach to the determination of the problem appeared to stem from the belief that what was required was the same analysis as that used to determine the problem when using the problem and solution

approach to evaluate inventive step, possibly because differences and problems are involved in both situations.

The board stated that it was not convinced that the investigation of technical relationships for unity with the aid of common problems underlying the inventions is necessarily the same as the analysis that is used to determine the problem when using the problem and solution approach to evaluate inventive step. The board gave the following reasons:

(1) The evaluation of unity involves comparing problems solved (or effects achieved) by different claims, whereas the evaluation of inventive step is carried out on a single claim. As a result, when examining unity, the problems solved by different claims must be considered in the light of each other and cannot be determined in isolation in an absolute sense.

(2) In the evaluation of inventive step, the idea is to define a problem based on the distinguishing features that is essentially as narrow as possible, but not involving elements of the solution. On the other hand, in the evaluation of unity, these restrictions do not apply, since the overall object is to find out what the claims involved have in common, i.e. if the respective inventions are so linked as to form a single general inventive concept.

Thus, the specific problems solved by the different inventions with respect to the closest prior art might need gradual refinement, in particular generalisation starting from the problem directly solved, to find out whether or not there was a common denominator that still distinguished the inventions from the said prior art.

5. The single general inventive concept

5.1. General

When deciding on unity of invention, it is mandatory under Art. 82, R. 44 EPC and under R. 13.1 PCT to determine whether or not a group of inventions claimed in an application forms a single general inventive concept. Thus, when seeking to establish at the search stage whether inventions comply with the requirement of unity, the first question to be considered is whether the inventions are linked by a single general concept.

In W 19/89 the board decided that the application clearly lacked unity of invention, since the four possibilities comprised by claim 1 related to a further development of the state of the art in different directions, namely by employing different classes of dehalogenation agents having no new technical feature in common. Where at least one solution of the underlying technical problem already formed part of the state of the art, the requirement of a "single general inventive concept" implied that the further solutions to that problem proposed in the application must have at least one new element in common, this new element being normally represented by at least one new technical feature. Since the absence of such a unifying new technical feature was admitted by the applicant, the application related to more than one invention.

A useful analysis of the single general concept was made in W 6/90 (OJ 1991, 438). The board found that this concept manifested itself in features common to different teachings expounded individually in the same application. It observed that a teaching for the purposes of patent law encompassed not only the immediate subject-matter representing the solution to the problem as defined in the relevant claim, but also its technical consequences which were expressed as effects. It was noted that any subject-matter was defined by structural features and the relationship between them. The relevant effects, i.e. the outcome or results achieved by the invention as claimed, would usually already be apparent from the problem as stated. A single general concept might therefore be said to be present only if a partial identity existed between the teachings in an application deriving from the structural features of the subject-matters claimed and/or the outcome or results associated with those subject-matters.

Where subject-matters of the same category were concerned, a partial identity, generating unity of invention, could result from the structural features of these subject-matters and/or their associated effects. The absence of such an element common to all the different teachings in the application, and hence a lack of unity, might be established a priori under certain circumstances. A lack of unity might, however, also be established a posteriori between the subject-matters of different independent claims or in the remaining subject-matters if the subject-matter of a linking claim was clearly not novel or inventive vis-à-vis the state of the art. The board gave an example of what was meant by the abstract term "single general concept": a product, a process specially adapted for the manufacture of the said product, and a use of the said product, for example, embodied a single general concept because, on the one hand, the partial identity between the product and its use derived from the structural features of the product and, on the other hand, the partial identity shared by the product and the process specially adapted for its manufacture also derived from the product which was to be considered as the effect or result of this process (see T 119/82, OJ 1984, 217).

The board also noted that the criteria governing unity of invention for the purposes of R 13.1 PCT elucidated above also applied in principle where the inventive step was based chiefly on the discovery of an unrecognised problem (see T 2/83, OJ 1984, 265). If the common problem, i.e. the effects to be achieved, was itself already known or could be recognised as generally desirable (a mere desideratum) or obvious, there would be no inventive merit in formulating the problem. If the common structural features were to be found only in the prior art portions of the claims, and if these known features did not help to solve the problem of the combined whole, this might also indicate a lack of unity.

In W 38/90 the sole common link between the subject-matter of claims 1, 2 and 4 was that the respective features all contributed to the realisation of the same device – a viewing assembly for a door. The board observed that this common pre-characterising feature was confined to indicating the designation of the invention, as part of the prior art; it was not, however, a specific feature interacting with the remaining characterising features and thereby contributing to the various inventions and their effects. Therefore, this sole link had to be rejected as irrelevant as regards any possible contribution to inventiveness. As already concluded, in the absence of any kind of common relevant feature, no unity "a priori" could be recognised.

In W 32/92 (OJ 1994, 239) the board held that there was no unity of invention where the subject-matters of independent claims, including their effects, had no common inventive feature in those parts of the claims differing from the closest prior art.

In T 861/92 the apparatus claimed was specifically adapted for carrying out only one step of the claimed process. The board came to the conclusion that the subject-matter of the claims satisfied the requirements of Art. 82 EPC 1973 as there was a technical relationship between both inventions.

In W 9/03 the board held that a common problem could establish the unity of different inventions only under certain conditions, for example in the case of a problem invention. According to the applicant, the common problem was considered that of providing a more secure, faster and easier connection setup. The board started from the assumption that the person skilled in the relevant art would normally consider this problem. The common problem was therefore so broadly formulated that it was "itself already known or could be recognised as generally desirable or obvious" (see W 6/90, OJ 1991, 438); as a result, unity could not thereby be established. See also T 2482/12.

5.2. Special technical features and inventive character of the single general concept

R. 13.2 PCT defines the method for determining whether the unity requirement is satisfied in respect of a group of inventions claimed in an international application: "Where a group of inventions is claimed in one and the same international application, the requirement of unity of invention referred to in R. 13.1 PCT shall be fulfilled only when there is a technical relationship among those inventions involving one or more of the same or corresponding special technical features. The expression "special technical features" shall mean those technical features that define a contribution which each of the claimed inventions, considered as a whole, makes over the prior art" (cf. R. 44(1) EPC).

According to the case law, once such a single, i.e. common, concept was established, it was necessary to consider whether or not the same could contribute to the inventiveness of the various subject-matters claimed in the case. Nothing indicated that this concept was known or belonged to the general knowledge of the man skilled in the art. Since the search examiner did not indicate that the documents cited in the case could exclude such a contribution, it could not be assumed that this could not be the case (W 17/89; see W 6/90, OJ 1991, 438). In view of this, a single inventive concept had to be attributed to all claims linking all their subject-matters (see W 22/91).

In W 6/90 (OJ 1991, 438; see also in this chapter II.B.5.1. above) the board noted inter alia that R. 13.1 PCT also stipulated that the single general concept had to be inventive. Even with a given single general concept there was lack of unity if the concept had no inventive character. The boards of appeal have confirmed the above decision on several occasions (see e.g. W 31/91, W 29/92, W 34/92, W 45/92, W 8/93 and W 6/97).

In W 48/90 and W 50/90 the board noted that as far as chemical compounds were concerned, unity of invention was no mere question of the respective structural features,

but had to be decided taking into account the technical problem to be solved and whether or not the respective compounds contributed to the solution found.

In W 45/92 the board stated that the term "inventive" could not be interpreted as a requirement for the common part to be inventive per se and therefore claimable as such. The investigation in this respect should concentrate on whether or not all or some of such features could contribute to the later detailed consideration of the inventive steps. Only if the state of the art or common general knowledge which had already been taught showed, beyond reasonable doubt, that this was not possible in the circumstances, should non-unity be declared. It further held that the term "same or corresponding special technical features" recognised that the features should define a contribution to the invention vis-à-vis the prior art. As the features in question were also part of the most relevant state of the art, where they were set out in an identical manner, they could not provide such a contribution. Thus, the various inventions, if any, had to lie in the unshared specific characterising features in each case. Since the claims contained no other common feature between them in the characterising part, this confirmed the conclusion of lack of unity (see W 32/92, OJ 1994, 239).

In W 38/92 the board confirmed W 6/90 (see above) and noted that the common features in the claim groups represented the "sole concept" linking the various subject-matters. The board stated that the remaining question was whether or not any of these specific features in the claim groups or their combination could make a contribution to the inventive steps relating to each claimed subject-matter; if so, this would render the said concept linking the various subject-matters inventive. The board observed that the new R. 13 PCT also required such a contribution by the suggested common "special technical features" over the prior art, i.e. that more than novelty be provided. In T 94/91 the board made it clear that the general inventive concept could not be equated with the features cited in a claim or in a particular combination of claims. What should be considered was the inventive concept as defined in the claims with due regard to the description and any drawings (see W 2/95).

In W 9/93 the board noted that the intermediate compounds were known, so that these products could not serve as a common inventive concept, and that a technical feature contained in the process claims was also known. The board pointed out that a technical feature which already formed part of the state of the art could not, by definition, make a contribution over the prior art and did not, therefore, qualify as a unifying element within the meaning of R. 13.1 PCT. According to R. 13.2 PCT, as in force from 1.7.1992, an international application could relate to a group of inventions if there was a "technical relationship" among those inventions involving one or more of the same or corresponding "special technical features", i.e. such technical features that defined a contribution which each of the claimed inventions made over the prior art. R. 13.1 PCT did not simply require some link between a group of inventions claimed in an international application, but a common inventive concept. This meant that there must be either a common technical problem or at least, if there was more than one technical problem, there must be one single technical concept behind the solutions of these different problems.

In **T.957/96** the application described a number of processes which did not have any process step in common. According to the board, the decisive fact was that all the processes claimed shared a common technical feature, namely the use of the substantially pure regioisomer, which was essential for solving the technical problem addressed by the application. It was this use of the intermediate compound which formed the common "inventive" concept of all the claimed process variants. In other words, this feature constituted a special technical feature which defined the contribution that the claimed invention made over the prior art as required by R.30(1)EPC.1973 (see now R.44(1)EPC).

In **W.11/99** (OJ 2000, 186) the board held that if, in an international application, there are claims directed to products and to a process for the manufacture thereof, it could not be assumed that there were no corresponding special technical features within the meaning of R.13.2.PCT simply because the process could also be used to manufacture other products. The board interpreted the requirement for the presence of "corresponding special technical features" under R.13.2.PCT in cases where a manufacturing process and products were being claimed in the same application to mean that they could usually be assumed to be present where the production process is new and actually suited to making the claimed products accessible (where appropriate in addition to further products). In such cases the board regards the process as being "specially adapted" to the manufacture of the claimed products. A narrower interpretation of the terms "specially adapted" and "corresponding special technical features" would not fulfil the legislative purpose of Art.34(3)PCT and associated R.13.1.PCT, which, in the board's view, was the same as that of Art.82.EPC.1973, namely to prevent subject-matters which were not interconnected being claimed in one and the same application. This interpretation accorded with Annex B to the PCT Administrative Instructions mentioned in the PCT Guideline III-7.2 (July 1998 version), where it is stated in Part 1, item (e), that a process is specially adapted for the manufacture of a product if it inherently results in the product (see now Annex B, para. (e) PCT Administrative Instructions, as in force from 1.1.2019). If this condition was met, it was irrelevant whether other products could be obtained using the process.

In **T.106/06** the board referred to the established case law of the boards of appeal according to which a manufacturing process and its resulting products are considered as unitary subject matter (e.g. **W.2/95** and **W.11/99**). The board gave consideration to the question whether the fact that claim 1 did not relate to a manufacturing process in the usual sense which may be characterised in that the specific end products are envisaged at the outset of the process, but to a process of isolating genes which, in view of its set up, has resemblance to a screening process which, in turn, may be characterised in that the final product is not known at the outset, should have an influence on the assessment of unity. The board held that the decisive question was whether the product had actually been produced by the process and not whether it had been known at the start of it. Therefore, there was no difference in the assessment of unity between a manufacturing process and a screening process and their resulting products.

In **W.18/01** the board pointed out that it followed from the definitions in the Regulations under the PCT and the PCT International Preliminary Examination Guidelines (which are

binding on the EPO; see G 1/89, OJ 1991, 155, point 6 of the Reasons) that it was normally not sufficient merely to define and examine the common core of a group of inventions, for example by indicating the features which were specified in all the claims defining the inventions of the group. R. 13.2 PCT required an examination of the technical relationship among the inventions in a group. Such a relationship could exist even if the inventions did not involve the same technical features, provided they involved corresponding special technical features. The definition of "special technical features" given in R. 13.2 PCT required an analysis of the contribution which each of the claimed inventions made over the prior art. This first entailed analysing which of the features distinguished the claimed inventions from the cited prior art before their contribution could be examined in the light of the description, in particular the problems solved and the effects achieved by the claimed inventions.

5.3. Unity of single claims defining alternatives ("Markush claims")

R. 44(1) EPC and R. 13.2 PCT also apply where a single claim defines alternatives ("Markush claim"). According to R. 44(2) EPC and R. 13.3 PCT, the determination of whether a group of inventions is so closely linked as to form a single general inventive concept shall be made without regard to whether the inventions are claimed in separate claims, or as alternatives within a single claim (see also W 35/91).

In considering whether the ISA had substantiated its findings of non-unity, the board in W 3/94 (OJ 1995, 775) referred to the section on the "Markush practice" in Annex B, Part 1(f) of the Administrative Instructions under the PCT, as in force from 1.7.1992 (see now Annex B, para. (f) PCT Administrative Instructions, as in force from 1.1.2019). Here it is stated that the requirement of a technical interrelationship and the same or corresponding special technical features as defined in R. 13.2 PCT shall be considered met when the alternatives are of a similar nature. The section then specifies when alternatives are to be regarded as "of a similar nature."

In W 1/94, the EPO acting as ISA had found that the compounds according to the "inventions" it had identified did not have a new structural element. Nevertheless the board concluded that the absence of such an element did not automatically destroy the unity of the invention. On the contrary, it was clear from the PCT Administrative Instructions that a technical relationship must be recognised for a group of alternative chemical compounds, such as all the compounds having a common property or activity, and such a common activity existed in the case in point. The new use could therefore form the general inventive concept linking the subject-matters of the claims in accordance with R. 13.1 PCT and had to be treated as a functional characteristic linking the compounds claimed.

In W 6/95 the board referred to the PCT Administrative Instructions, binding not only on the ISA but also on the board of appeal acting as the "three-member board" according to R. 40.2(c) PCT (see G 1/89, OJ 1991, 155; since 1.4.2005, the references in the PCT Regulations to "three-member board" have been replaced by "review body" – see also in this chapter II.B.1. "Introduction"). The board noted that it followed from Annex B, Part 1(f)(i) PCT Administrative Instructions (now part of Annex B, para. (f) PCT Administrative Instructions, as in force from 1.1.2019) that in order to establish unity

of invention "a posteriori", it was not sufficient for all alternatives of chemical compounds covered by a Markush claim to have a common property or activity, i.e. be suitable for solving a common technical problem, because according to item (B)(1) they had, in addition, to have a "significant structural element" in common in order for the alternatives to form unity. The board made it clear that it was, however, not in agreement with the explanation given in Annex B, Part 1(f)(ii) PCT Administrative Instructions to assume that the said "significant structural element" had to be novel per se. Rather, this expression meant that in relation to the said common property or activity there had to be a common part of the chemical structure which distinguished the claimed compounds from known compounds having the same property or activity (see also W 6/97).

In T 169/96 the board noted that the fact that claim 1 also comprised a known compound, not covered by claim 2, was of no relevance to the question of unity, because R. 30(b) EPC 1973 (in the version as in force until 31.5.91; also in the version in force thereafter) did not require that there must be a common concept unifying different "means" according to it. It was not relevant here that the three different classes of chemical compounds identified by the examining division comprised completely different chemical structures of a residue. The board observed that Chapter C-III, 7.4a of the then applicable EPO Guidelines, which had been relied on by the examining division, as well as Annex B, Part 1(f) PCT Administrative Instructions (see now Annex B, para. (f) PCT Administrative Instructions as in force from 1.1.2019), concerning Markush-type claims, rightly stated that the said significant structural element might consist of a combination of individual components linked together. It was not stated there that the combination of individual structural elements had to be novel per se, nor did such a requirement follow from Art. 82 EPC 1973. Rather it followed from that guideline that this expression meant that in relation to the said common property or activity there had to be a common part of the chemical structure which distinguished the claimed compounds from known compounds having the same property or activity (see now Guidelines F-V, 2.2.2.2 – November 2018 version).

In W 4/96 (OJ 1997, 552) the board noted that the requirement of a technical relationship as defined in R. 13.2, first sentence, PCT might be met when all claimed alternatives belong to a class of compounds which might be expected to behave in the same way in the context of the claimed inventions ("Markush claims"). The technical relationship involved those common special technical features that defined a contribution over the state of the art (R. 13.2, second sentence, PCT; see also W 6/96, W 1/10). However, such contribution could not be recognised on the basis of this expectation if members of the class had already been shown in the prior art to behave in the manner disclosed in the application. The board added that if at least one Markush alternative was not novel over the prior art, the question of unity had to be reconsidered by the examiner, i.e. a posteriori (Annex B, Part I (f)(v) PCT Administrative Instructions in conjunction with PCT Search Guidelines; see now Annex B PCT Administrative Instructions, as in force from 1.1.2019, also PCT International Search and Preliminary Examination Guidelines, as in force from 1.1.2019).

The board also held that an objection of lack of unity could be raised a posteriori with regard to all categories of grouping of alternatives of chemical compounds. An a posteriori

assessment of unity had to be made in all circumstances in the same way, since the legal requirement of R. 13 PCT was the same for all cases. Therefore, the a posteriori assessment of unity in cases of a functional relationship within a group of compounds had to be made in a manner corresponding to the assessment in cases of a structural relationship. This was appropriate for compounds related by their structure as well as for compounds related by their function. The structural relationship within the meaning of Annex B, Part I (f)(i)(B)(1) and the relationship within the meaning of Annex B, Part I (f)(i)(B)(2) and (iii) served the same purpose: both tests were intended to show whether the alternative compounds were of a similar nature, as was said in the introductory part of Annex B, Part I(f)(i). These tests were only tools in order to determine whether there was unity of invention as defined in R. 13 PCT.

Claim 1 in W 34/07 was directed to compositions for the coating of ceramic supports comprising micronised glass frits **and/or** nanosised zirconium hydroxide. The board concluded that the two claimed alternatives neither had in common express features not known in combination from the prior art nor represented two solutions to the same technical problem. The effects achieved by using either micronised glass or nanosised zirconium hydroxide were different and unrelated, although they might lead to "best results", i.e. when using a composition comprising both components.

6. Plurality of inventions – further search fees

If the search division or the ISA raises an objection of lack of unity, a further search fee is payable under R. 64(1) EPC (R. 46(1) EPC 1973) or Art. 17(3)(a) PCT, respectively, for each additional invention to be covered by the second report (for Euro-PCT applications in the European phase, see in this chapter II.B.6.2.). See also OJ 2017, A20 for the provisional opinion now issued together with the partial search report. If the fee is paid in due time applicants may select the single invention or group of inventions which they wish to retain in the (main) application.

This choice cannot be altered once examination of that invention has commenced (T 158/12, with reference to G 2/92). If an applicant responds unclearly or in a misleading way to an invitation from the examining division to specify which searched invention it wishes to prosecute further, then the division has to clarify this matter, e.g. via a further communication (T 736/14).

6.1. Consequences of non-payment of a further search fee

The board in T 178/84 (OJ 1989, 157) found that in the case of non-payment of the further search fee under R. 46(1) EPC 1973 the subject-matter not searched was regarded as abandoned and accordingly could not be pursued in the parent application. However, in T 87/88 (OJ 1993, 430) it was stated that non-payment could not result in abandonment. According to the latter board, non-payment of further search fees in no way prejudiced the future legal fate of the unsearched parts. R. 46(1) EPC 1973 merely provided that in the case of non-payment of further search fees the search division was to draw up a European search report only for those parts of the application that related to the invention for which the search fees had been paid.

In view of these conflicting approaches, the President of the EPO referred the following point of law to the Enlarged Board of Appeal:

"Can an applicant who fails to pay further search fees for a non-unitary application when requested to do so by the search division under R. 46(1) EPC 1973 pursue that application for the subject-matter in respect of which no search fees have been paid or must he file a divisional application for it?"

In the opinion of the Enlarged Board, given in G 2/92 (OJ 1993, 591), the application could not be pursued for subject-matter in respect of which the applicants had not paid the further search fees. Instead the applicants had to file a divisional application for that subject-matter if they wished to continue to protect it. In the view of the Enlarged Board, it was clear from the procedural system of the EPC that the invention which was to be examined for patentability had to be an invention in respect of which a search fee had been paid prior to the drawing up of the European search report. Part IV of the EPC envisaged that an application progressed after filing from the search division to the examining division. One object of R. 46 EPC 1973 was to implement this procedure by ensuring that an appropriately extensive search was completed in respect of each individual application before it was examined by the examining division. To this end, in response to an invitation from the search division to pay one or more further search fees in respect of one or more further inventions to which the application related, applicants had to pay such fees if they wished to ensure that one of the further inventions could become the subject of the claims of that application. That was the proper interpretation of R. 46(1) EPC 1973 in context. This confirmed the practice according to T 178/84.

In T 319/96 the initial application lacked unity, but no further search fee was paid. The applicant had argued that, because of the international-type search (Art. 15(5)(a) PCT) carried out by the EPO (in the priority application) for the subject-matter of original claims 4 to 10, it had not forfeited its right to choose and could therefore continue pursuing this subject-matter. It had paid a search fee for each of the two inventions, and two search reports had been prepared by the Office. The board, however, stated that under R. 46(1) EPC 1973 a search fee was to be paid for each further invention if the **European** search report was to cover that invention. R. 46 EPC 1973 did not provide that a search report from another procedure could be substituted for the European search report. The board referred rather to the possibility under Art. 10(2) RFees (see now Art. 9(2) RFees) of a full or partial refund of the European search fee where the Office has prepared an earlier search report on the same subject-matter. G 2/92 applied also in the present case because in the context of the European procedure only one search report had been drawn up after payment of only one search fee.

In T 2289/09 the appellant (applicant) had argued that since it was accepted practice that amendment in a divisional application could be based on subject-matter searched in the parent application, it should also be accepted that subject-matter that had been searched in a divisional was considered searched subject-matter generally and could thus form the basis for amendment in a parent. These circumstances were not explicitly excluded in G 2/92 (OJ 1993, 591). The board disagreed. The Enlarged Board had stated in G 2/92 that when an applicant failed to pay the requested search fees, that subject-matter could

not be pursued in the application for which the search was carried out, and furthermore that "the invention which is to be examined ... must be an invention in respect of which a search fee has been paid prior to the drawing up of the European search report". This statement had significance beyond the reasons given in G 2/92. When an applicant for a divisional application sought the benefit of an earlier search, he still had to pay the search fees (R 36(3) EPC). These were then refunded, conditional on the fulfilment of certain criteria (decision of the President of the EPO and notice from the EPO, OJ SE 1/2010, 322 and 325; see now decision of the President, OJ 2017, A94), namely if the EPO benefited from the earlier search report. There was no provision that would permit the EPO to proceed with search activities, including the examination of the claims in question and their scope, when no search fees were paid for a given part of an application, and also none that would entitle the examining division to request the payment of further search fees for the purpose of examining the usefulness of the earlier search on the divisional application.

In T 631/97 (OJ 2001, 13) the board held that R 46(1) EPC 1973 on its proper interpretation does not prohibit a review by the examining division of the search division's opinion on lack of unity where further search fees are not paid. A narrow interpretation of R 46(1) EPC 1973 whereby the finding of lack of unity by the search division is considered as final where the additional search fees are not paid would deprive the applicant of an opportunity to dispute that finding during the examination proceedings and would also unjustifiably restrict the power of the examining division on the question of unity to the subject-matter for which search fees were paid. Thus the board did not share the view held in T 1109/96. The board found the above interpretation of R 46(1) EPC 1973 to be in agreement with that of the Enlarged Board in G 2/92, and the examination procedure as set out in the Guidelines also to be in line with G 2/92. It noted furthermore, with reference to R 112 EPC 1973, that the practice of search and examination of international applications where the EPO was elected or designated Office was consistent with the above view.

This decision was followed in T 708/00 (OJ 2004, 160) – also referred to in this chapter II.B.6.3.

6.2. Euro-PCT applications

An applicant may pay additional search fees in the international phase if invited to do so by the ISA under Art. 17(3)(a) PCT.

Once the application has entered the European phase, R 164 EPC "Unity of invention and further searches" (rule amended by Decision of the Administrative Council dated 16 October 2013, OJ 2013, 503) allows applicants to obtain, upon payment of a (further) search fee, a search of any invention claimed which was not searched by the EPO in the international phase. Moreover, applicants may choose any invention searched by the EPO either in the international phase, in the procedure for supplementary search or in the procedure under amended R 164 EPC as a basis for further prosecution of the European phase (see Notice of 10 June 2014, OJ 2014, A70). Amended R 164 EPC entered into force on 1.11.2014. For the transitional regime see Notice of 10 June 2014, OJ 2014, A70, IV.23. and 24.

6.2.1 Treatment of non-unity according to former R. 164 EPC

In contrast to the current rule, R. 164(1) EPC in its previous version(s) prescribed that a European supplementary search report was to be drawn up on the invention or group of inventions first mentioned in the claims. Where no such supplementary search was to be carried out (i.e. where the EPO drew up the international search report or a supplementary international search report), the applicant had no possibility in the European phase to pay further search fees in that application in respect of inventions not covered by the international search report or any supplementary international search report. R. 164(2) EPC required the examining division, where it found that the application documents did not meet the unity requirements, or protection was sought for an invention not covered by the international search report, supplementary international search report or supplementary European search report, to invite the applicant to limit the application to one searched invention. Unsearched inventions could only be pursued in European divisional applications.

The following board of appeal decisions concern former R. 164 EPC.

In J 3/09, the Legal Board of Appeal confirmed in respect of R. 164 EPC (as then in force) that although the procedure on entry of an application into the European phase where the EPO had acted as the ISA changed with the coming into force of EPC 2000, the responsibility for establishing whether or not the application met the requirements of unity of invention still ultimately rested with the examining division, and the opinion of the EPO acting as the ISA on lack of unity was not final or binding on the examining division. The board observed that the practice of the examining division in this respect remained as before, noting in particular that to the extent that an objection of non-unity raised by the ISA turned out to be unjustified, the applicant was entitled to have the whole subject-matter of his unitary invention searched. This was also apparent from the then wording of R. 164(2) EPC, giving the EPO the power to invite the applicant to limit the application to one invention. This implied that where there was in fact only "one" invention there was no sanction.

The board in T 1285/11 followed this reasoning, adding that the fact that the applicant did not pay further search fees or protest fees in the international phase could not be seen as a tacit agreement with the findings of non-unity of the ISA. As to the wording of R. 164(2) EPC as then in force, it could be deduced from the juxtaposition of "an invention not covered by the international search report" and "one invention covered by the international search report" that, for the Rule to be applicable, the non-searched and searched inventions must indeed be non-unitary with respect to one another. In the case in hand, there was, prima facie, a feature which could be regarded as a special technical feature establishing unity between "invention 1" and "invention 2", and R. 164(2) EPC as then applicable could not be seen as a bar to further prosecution based on the main request.

In considering the applicability of R. 164(2), second half-sentence, EPC in the version then in force, the board in T 507/11 referred to the sanction of G 2/92 (OJ 1993, 591), whereby the application may not be pursued for subject-matter in respect of which no search fee

has been paid. In the board's view, this sanction did not necessarily apply to features disclosed in the original application documents in connection with an invention or group of inventions which has been searched. In the case in point, amended claim 1 contained all the features of searched claims 1 and 2. Protection was therefore still sought for the first, searched invention, now further restricted by features of original claim 13 (attributed by the ISA to another invention and therefore not searched), which, on account of the dependencies in the original claims, had been clearly and unambiguously disclosed. There was therefore no change to an unsearched invention. See also T 442/11 and T 509/11.

Further decisions concerned with the interpretation and application of former R. 164 EPC are T 1981/12, T 2473/12, T 2459/12 and T 145/13 (see also the section that follows).

6.3. Applicability of Rule 64, (former) Rule 164(2) EPC or Rule 137(5) EPC

In T 708/00 (OJ 2004, 160) the board pointed out, with reference to preparatory document CA/12/94 cited in the Notice from the EPO in OJ 1995, 409, that the purpose of R. 86(4) EPC 1973 (R. 137(5) EPC) was to deal with the situation arising when amended claims relating to unsearched subject-matter were filed in response to the examiner's first communication. It did not apply when the applicant had not paid the search fee in respect of a non-unitary invention in spite of being invited to do so under R. 46(1) EPC 1973 (R. 64(1) EPC), cf. also G 2/92, OJ 1993, 591. These two rules were complementary in nature.

In case T 1285/11 (see in this chapter II.B.6.2.1), the examining division had refused the application on the basis of R. 137(5) EPC as well as former R. 164(2) EPC. Referring to the afore-mentioned Notice and the applicable version of the Guidelines, the board found that R. 137(5) EPC was not contravened because the subject-matter of the amended claims had already been present in the claims as originally filed. See also T 442/11, T 507/11, T 509/11, T 998/14 and T 145/13.

In T 2459/12 it was acknowledged that the board in T 1981/12 had doubted the appropriateness of R. 137(5) EPC as a basis for refusing an application based on the requests in that case. However it was the present board's view that where, following the drawing up of a supplementary European search report by the EPO, an applicant filed amended claims seeking protection for subject-matter not covered by that report as a result of the application of former R. 164(1) EPC, an objection under R. 137(5) EPC should be raised. Non-compliance with R. 137(5) EPC was a ground for refusing an application.

Reference is also made to chapter IV.B.5. "Amendments relating to unsearched subject-matter – R. 137(5) EPC".

6.4. Dispensing with further search fee

In W 36/90 and W 19/89 the board observed that where there was lack of unity in an international application, in particular if the objection was evident a posteriori, the search examiner might decide to supplement the international search with a search on the additional inventions as well as on the first invention. This was so particularly if the

concepts of the inventions were very close and none of them required a search in different classification units, so that the search could be performed for all the inventions without creating too much extra work (see PCT Search Guidelines as agreed upon by the Interim Committee for Technical Cooperation at its seventh session in Geneva in October 1977, PCT/INT/5). In such a case no objection of lack of unity should be raised because charging further fees would be incompatible with the principle of equity vis-à-vis the applicant (see **G 1/89**; for searches of additional inventions without payment of fees, see paras **10.64-10.65** PCT International Search and Preliminary Examination Guidelines, as in force from 1.1.2019, and Guidelines for Examination B-VII, 2.2 – November 2018 version; see also e.g. **T 755/14**).

C. Sufficiency of disclosure

1. Introduction

Art. 83 EPC stipulates that the application "shall" (previously "must") disclose the invention in a manner sufficiently clear and complete for it to be carried out by a person skilled in the art. The related ground for opposition is in Art. 100(b) EPC.

The subject-matter of an application must be sufficiently disclosed at the date of the application (see in this chapter II.C.2.), based on the application as a whole (II.C.3.1.), including examples (II.C.5.3.), and taking into account the common general knowledge of the skilled person (II.C.4.). At least one way of enabling the person skilled in the art to carry out the invention must be disclosed (II.C.5.2.), but this is sufficient only if it allows the invention to be performed in the whole range claimed (II.C.5.4.). Parameters must be sufficiently defined (II.C.5.5.). The disclosure must also be reproducible without undue burden (II.C.6.); evidence for this from post-published documents is allowable under certain circumstances (II.C.6.8.).

The distinction between the requirements for sufficiency of disclosure under Art. 83 EPC and clarity of the claims under Art. 84 EPC (II.C.7) is important, as examination in respect of the requirements of Art. 83 EPC is still permitted during opposition proceedings, whereas in respect of Art. 84 EPC it is limited to cases where there has been an amendment (see also G 3/14 in chapter II.A.1.4.).

The burden of proof generally lies with the opponent to establish that an invention is insufficiently disclosed (II.C.9.).

Sufficiency of disclosure as applied in biotechnology is considered in this chapter II.C.7., including the issue of broad claims (II.C.7.1.4.).

2. Date of compliance

Sufficiency of disclosure under Art. 83 EPC requires inter alia that the subject-matter claimed in a European patent application be clearly identified. This requirement must be complied with as from the date of filing because a deficiency in a European patent application as filed, consisting in an insufficient identification of the subject-matter claimed, cannot subsequently be cured without offending against Art. 123(2) EPC which provides that the subject-matter content of a European patent application as filed may not be extended (G 2/93, OJ 1995, 275).

It is not the purpose of the patent system to grant a monopoly for technical speculations that cannot be realised at the time of filing (T.1164/11). See also in this chapter II.C.6.8. "Post-published documents". About monopoly, see the discussion in T.1845/14.

According to the board in T.512/07, objections under Art. 83 EPC 1973 may under some circumstances be overcome by amending the claims, since thereby the "invention" referred to in Art. 83 EPC may be so changed that it no longer depends on the insufficiently disclosed aspects of the application for its realisation. However such objections cannot be overcome by amendment of the description and drawings, since the amendment would then add subject-matter to the application as filed. In general, the claimed subject-matter at issue had to be examined for compliance with Art. 83 EPC 1973 on the basis of the application documents as originally filed.

3. Parts of the application relevant for assessing sufficiency of disclosure

3.1. Application as a whole

Sufficiency of disclosure within the meaning of Art. 83 EPC must be assessed on the basis of the **application as a whole** – including the description and claims – (see leading decisions T.14/83, OJ 1984, 105; and also T.169/83, OJ 1985, 193) and not of the claims alone (see e.g. T.202/83, T.179/87 of 16 January 1990, T.435/89, T.82/90, T.126/91). The drawings must be considered as ranking equally with the other elements of the application when considering whether the requirements of Art. 83 EPC (and Art. 84 EPC) have been satisfied (see T.169/83, OJ 1985, 193; T.308/90 and T.818/93).

In T.32/84 (OJ 1986, 9) it was pointed out that the fact that certain elements of an invention essential to its operation were not referred to explicitly either in the claims, or in the relevant portion of the description nor shown in the drawing of the invention as claimed did not necessarily mean that the application did not disclose the invention in a manner sufficiently clear and complete for it to be carried out by a person skilled in the art as required by Art. 83 EPC 1973. This decision was cited, inter alia, in T.391/91, T.830/02 and T.25/09.

According to established case law, substantially any embodiment of the invention, as defined in the broadest claim, must be capable of being realised on the basis of the disclosure. This implied in particular that an objection of insufficiency could be raised against the subject-matter of any claim, independent or dependent (R.29(3) EPC 1973, now R.43(3) EPC). From a legal point of view it was therefore irrelevant whether or not the feature objected to was essential or to what degree the scope of protection conferred by the patent depended on the claim in question (T.226/85 (OJ 1988, 336), cited in many decisions, for example, T.1011/01 and T.1129/09). The board in ex parte case T.206/13 could not accept the appellant's submissions to the effect that preferred or optional features defined in a claim should be disregarded in the assessment under Art. 83 EPC. According to the established case law the requirement of sufficiency of disclosure defined in Art. 83 EPC was only complied with if the disclosure of the invention allowed the skilled person to perform, without undue burden, essentially all the embodiments covered by the claimed invention. This applied in particular to the specific particular embodiments of an invention defined in dependent claims pursuant to R.43(3) EPC (T.1011/01) and, by the

same token, to any optional feature defined in a claim, since such a feature also constituted, by its very nature, a particular embodiment of the claimed invention, irrespective of whether the optional feature was qualified as being "preferred" or not.

In T. 797/14 the board came to the conclusion that the essential element of the claimed invention, namely the coating composition Flurotec (TM), was not of public knowledge and that there was also not enough information available to the skilled person for him to reliably determine the composition or structure of the product. The counterpart of a monopoly by a patent is however the disclosure of the invention, in particular of its essential elements, and not the provision or use of a commercial product whose structure and composition are not public.

Disclosure is insufficient if the skilled person, taking into account the entire teaching of the patent, cannot rework an invention which is defined in the claims in a completely clear and comprehensible manner, unless he disregards a meaningful feature (T. 432/10).

3.2. Alleged effect not a feature of the claims

In T. 1311/15 the parties did not dispute that claim 1 did not include any flammability requirement in its wording. It was however also undisputed that the invention aimed at providing non-flammable refrigerant compositions. The question arose whether, when examining the ground of opposition under Art. 100(b) EPC the intended effect of the claimed subject-matter should be taken into account. It is however well-established case law that an objection of insufficient disclosure cannot legitimately be based on an argument that the patent does not enable a skilled person to achieve a technical effect which is not defined in the claim.

An objection of insufficient disclosure under Art. 83 EPC cannot legitimately be based on an argument that the application would not enable a skilled person to achieve a non-claimed technical effect (T. 2001/12, citing mainly G. 1/03 (OJ, 2004, 413) but also T. 1079/08, T. 939/92 and T. 260/98). T. 2001/12 dealt with the distinction between the requirements of sufficiency of disclosure (Art. 83 EPC), clarity of the claims (Art. 84 EPC) and inventive step (Art. 56 EPC). That decision was cited in T. 862/11, in which the board addressed the relevance of the technical effect for the purposes of Art. 83 EPC and concluded that a distinction had to be made between how the effect was to be considered in that context and how it was to be considered for the purposes of Art. 56 EPC.

T. 206/13 also applied T. 2001/12, in so far as the examining division, in the context of the assessment of sufficiency of disclosure of claims 1 and 11, had referred to technical aspects which, in its opinion, were not sufficiently disclosed. The board pointed out that these technical aspects were not defined in claims 1 and 11 and, consequently, were not to be considered in the assessment under Art. 83 EPC of the invention defined in claims 1 and 11. The requirement of sufficiency of disclosure related to the invention defined in the claims, and in particular to the combination of structural and functional features of the claimed invention, and there was no legal basis for extending such a requirement also to encompass other technical aspects possibly associated with the invention (in particular, technical features or effects mentioned in the description) but not required by the claimed

subject-matter. Such technical aspects might be pertinent in the assessment of other requirements of the EPC (in particular, the requirements of [Art. 84](#) and [56 EPC](#)).

4. Knowledge of skilled person relevant for assessing sufficiency of disclosure

4.1. The disclosure is aimed at the skilled person

The same level of skill has to be applied when, for the same invention, the two questions of sufficient disclosure and inventive step are being considered ([T 60/89](#), OJ 1992, 268; [T 694/92](#), [T 187/93](#), [T 412/93](#)). However, the standard of disclosure required for amendments by [Art. 123\(2\) EPC 1973](#), namely that of being directly and unambiguously derivable, is inappropriate, the criterion being that it must be possible to reproduce the invention on the basis of the original application documents without any inventive effort and undue burden ([T 629/05](#); cited in [T 79/08](#)).

It is the **same skilled person** that has to be considered when construing the subject-matter of a claim. It accordingly follows that the construction of a particular claim should be identical for the assessment of inventive step and sufficiency of disclosure ([T 967/09](#)).

The skilled person may use his common general knowledge to supplement the information contained in the application ([T 206/83](#), OJ 1987, 5; [T 32/85](#), [T 51/87](#), OJ 1991, 177; [T 212/88](#), OJ 1992, 28; [T 772/89](#)) He may even recognise and rectify errors in the description on the basis of such knowledge ([T 206/83](#), OJ 1987, 5; [T 171/84](#), OJ 1986, 95; [T 226/85](#), OJ 1988, 336). Textbooks and general technical literature form part of the common general knowledge ([T 171/84](#), [T 51/87](#), [T 580/88](#), [T 772/89](#)). Common general knowledge does not normally include patent literature and scientific articles (see [T 766/91](#), point 8.2 of the Reasons; [T 1253/04](#), point 10 of the Reasons; both cited in [T 2059/13](#), a decision concerning therapeutic use of a chemical compound in which the board also examined the possible role of post-published evidence). Information which can only be obtained after a comprehensive search is likewise not to be regarded as part of the common general knowledge ([T 206/83](#), [T 654/90](#)). According to the board in [T 475/88](#), a disputed claim of common general knowledge must be backed up by evidence. As a rule, demonstrating that the knowledge in question can be obtained from a textbook or monograph will be sufficient.

In [T 2305/11](#) the application did not give details of how to determine the essential feature (maximum solubility pressure of at most 1 000 bar), but the board accepted the appellant's argument that the skilled person knew of suitable methods. It nevertheless found that crucial information was missing because the application did not disclose that, in many cases, no maximum could be found, or how to proceed in those cases. No useful guidance could be found in the description, and the appellant had failed to show how the skilled person could use his common general knowledge to fill in the gaps in disclosure or overcome the lack of guidance.

In [T 2004/14](#) (absorbent article), the board decided that, in the absence of any indication in the patent in regard to the method (and the test conditions) of determining the absorption

capacity, the skilled person would not be able to reliably and repeatedly determine the crucial condition set out in claim 1. The blotter-method was not the only applicable test known by the skilled person and, even if it were, at least the value for the draining pressure to be applied in order to expel interstitial fluids would still be lacking. That, allegedly twenty-four patent publications disclosed the blotter-method did not convince the board since these patents were solely from two corporations. Moreover, it was likely that they would, when applying such a non-standardised blotter-method, perform the test under different conditions, which was exactly what standards aimed to avoid.

In accordance with the established case law (see e.g. T 206/83, T 1040/03), a detailed disclosure is not necessary if the skilled person, who has common general knowledge at his immediate disposal, is capable of putting the invention into practice without the burden of exercising inventive skill. This principle obviously extends to all variants encompassed by a claim (T 1018/05, cited also in T 2301/12 in respect of variants clearly outside the scope of practical application of the claimed subject-matter and values of a parameter not obtainable).

The patent must provide guidance enabling the skilled person to identify the process features decisive in overcoming a prejudice. The skilled person should not have to work this out himself (T 419/12).

T 1861/11 concerned an invention relating to user interfaces. The appellant (applicant) chose to disclose the invention by means of a conceptual metaphor, a so-called "3D motion user interface", and the relevant disclosure was very brief. In the circumstances of the case, the board decided that details that the skilled person would need were not disclosed (Art. 83 EPC not satisfied). Moreover, as a matter of principle, a deficiency in disclosure concerning the conceptual fundamentals of the invention could not be remedied without violating the restrictions codified in Art. 123(2) EPC.

Patent specifications cannot normally contribute to the sufficiency of the disclosure unless they are available to the skilled reader of the patent in question (T 171/84, OJ 1986, 95). By way of exception, however, patent specifications and scientific publications may be considered to form part of the common general knowledge where the invention is in a field of research so new that the relevant technical knowledge is not yet available from textbooks (T 51/87, OJ 1991, 177; see also T 772/89, T 676/94, T 1900/08, T 2196/15). In T 676/94 the board considered that the question whether or not the contents of a technical periodical formed part of the average knowledge of a skilled person when assessing sufficiency of disclosure, should be answered on the basis of the facts and evidence in each particular case.

References to DVB standards were found insufficient to meet the standards of Art. 83 EPC in T 1191/04. In T 417/13 the size of the PVC particles was an important feature. The particle size may vary to a large extent depending on the method of measurement. The description of the application provided only very limited information. The person skilled in the art had thus to rely on his common general knowledge for the selection of an appropriate method of measurement. The board concluded that in the present case of PVC particles the skilled person would not have considered using any method of

measurement, but would have chosen a method relying on sieving, such as a method according to ISO standard 1624. It was also decided that in this case the physical and mathematical facts about particle size measurements were notorious.

In **T.1608/13** the board noted that a patent document is directed to the skilled person, who interprets it in the light of the common general knowledge in the technical field concerned. Consequently, it is not necessary for all the details of the invention to be specifically described in order for a disclosure to be sufficient. In the present case, in the absence of a description in the patent of a specific measuring method for determining the sieving coefficient of a membrane for the separation of toxic mediators from blood by haemofiltration, the skilled person would first look for applicable standards in the field, if present. Whether other methods for carrying out the measurements were available was not decisive as long as there was no evidence that the results in the specific field of the invention would be contradictory depending on the chosen method. The respondent (opponent) did not provide any such evidence.

In **T.521/12** claim 1 could be given different interpretations, in particular, with respect to the relationship between the features of the claim preamble and the features recited in the characterising part. However, as the only issue was sufficiency of disclosure, an interpretation of the claim wording was required only as far as it was relevant for deciding whether Art. 83 EPC was complied with. It was therefore implicit, in the board's view, that the expression "portion of electronic information" in feature (g) could not cover any possible type and format of electronically stored data, but was to be given a meaningful interpretation determined by the function it was expected to perform in the context of the claimed subject-matter. The skilled person wishing to implement the claimed invention would therefore exclude as meaningless and not consistent with the teaching of the application any type of "electronic information" which because of its content and/or format was irrelevant, or unsuitable.

T.658/04 summarised the case law about what forms part of the common general knowledge. The board considered that an expert opinion submitted by the appellant (patent proprietor) which contained general considerations (not supported by verifiable facts) did not form part of the common general knowledge (see also chapter I.C.2.8.1 "Definition of common general knowledge"). See also **T.842/14** (quoting **G.1/92**, OJ 1993, 277), which concerned the requirements that a chemical composition of a commercially available product designated by a trademark in the claim be part of the common general knowledge of the skilled person. See also **T.2196/15** for an example of difficulties in proving the common general knowledge.

In **T.443/11** the board noted that during the course of the proceedings the examining division had argued that claim 1 had to be taken literally. The board disagreed with this statement, since it was established case law of the boards of appeal that claims should be interpreted in the manner that they would be understood by a person skilled in the art. In the context before it the board considered that the skilled person would understand (mathematical operations implemented in electronic devices).

In T 1516/14 the board stated that the consideration as to whether or not a particular feature distinguished the claimed subject matter from the prior art, or indeed whether or not it was merely a statement of something that was inherently true, played no role in assessing sufficiency of disclosure. Nor was it for the board to speculate as to why a particular feature was added to the claim in examination proceedings. The subjective intentions of the patentee are relevant for the purposes of interpreting the claims only to the extent that these intentions were explicitly formulated in and therefore derivable from the patent specification itself. The board did not rely solely on internal logic or syntax of the claim to arrive at the conclusion that Art. 83 EPC was satisfied; referring a question in this respect to the Enlarged Board was not justified. See also chapter II.A.6.1. about the contribution of T 1516/14, concerning interpretation of claims and the skilled person's approach meaning as being a purely technical approach.

4.2. References may also enable the skilled person to carry out an invention

It is established case law that features not mentioned in the application documents themselves but in a document to which they refer may be incorporated into a patent claim if they unequivocally form part of the invention for which protection is sought. However, all the essential structural features thus disclosed which belong together must be incorporated into the claim; it is not permissible to single out a particular one (T 6/84, OJ 1985, 238; cited in numerous decisions).

In T 288/84 (OJ 1986, 128), the board held that where an invention relates to the improvement of prior art originally cited in the description of the invention, a feature described in broad terms in the cited document but not mentioned expressly in the invention is sufficiently disclosed if it is realised in the examples of the invention in the form of an embodiment also mentioned in the reference document.

An invention is also sufficiently disclosed if reference is made to another document in the patent specification and the original description, and the skilled person can obtain from this cross-reference the information required to reproduce the invention but not disclosed in so many words in the description itself (T 267/91, T 611/89). In T 920/92 the board held that this applied irrespective of the language in which it was drafted; (here Japanese).

However, where the reference document was possibly short-lived advertising material, the applicant was wise to incorporate the published information explicitly rather than by mere reference (T 211/83, cited in T 276/99).

In T 737/90 it was explicitly stated that a reference to another document can only be taken into account if the document referred to can be unambiguously identified and the relevant addressees have ready access to it. This depends solely on the facts of the case. Following T 737/90, the board in T 429/96 confirmed that a document incorporated by reference into the text of a European patent application had to become available to the public at the latest on the **publication date** and not on the **filing date** of the European patent application, in order to be taken into account for the purposes of Art. 83 EPC 1973.

The enabling disclosure of the invention in T. 521/10 relied on the content of (US) patent applications incorporated by reference which did not fulfil the requirements set out in T. 737/90. In order to be validly incorporated, each document must: (i) be available to the Office on or before the date of filing of the application; and (ii) be available to the public no later than on the date of publication of the application under Art. 93 EPC. As neither of the two documents was made available to the public and the only publication originating from the two documents was a continuation-in-part application which was published on a date later than the publication date of the European application at issue, the two documents were not validly incorporated by reference.

In T. 341/04, the question was whether a referenced document, which could be unambiguously identified at the date of filing of the document containing the reference by its document number, but which document itself was "missing" in the sense that it was not available at said date of filing, could be "taken into account" for the purpose of Art. 83 EPC 1973 by relying on information present in a family member of the referenced document. The board answered in the affirmative.

5. Clarity and completeness of disclosure

5.1. General principles

It must be possible to reproduce a claimed step using the original application documents without any inventive effort over and above the ordinary skills of a practitioner (T. 10/86). Where an applicant did not furnish details of the production process in the description in order to prevent the invention from being copied easily and the missing information could not be supplied from the general knowledge of a person skilled in the art, the invention was held to be insufficiently disclosed (T. 219/85, OJ 1986, 376).

In T. 1164/11 the board was not aware of a known physical mechanism according to which light was able to push molecules of a medicament, contained in the matrix of a solidified medicamentous solution, into the skin. The board had serious doubts regarding the claimed interaction of the (laser light) energy emitter with the molecules and the claimed result of penetration of the molecules into the skin. The appellant (applicant) admitted that there might be a **lack of scientific explanation**, but stated that nevertheless a "surprising effect" was achievable with the claimed device "without knowing the real phenomena occurring in the skin". The board accepted that it might not be possible to provide a scientifically sound explanation and that the invention might still be sufficiently disclosed if such an unexpected effect was convincingly demonstrated. However, the original application was devoid of any test results or experimental evidence that could give an indication of light-induced enhancement of penetration of medicament molecules into the skin.

5.2. Indication of at least 'one way'

An invention is in principle sufficiently disclosed if at least one way is clearly indicated enabling the person skilled in the art to carry out the invention. If this is the case, the non-availability of some particular variants of a functionally defined component feature of the

invention is immaterial to sufficiency as long as there are suitable variants known to the skilled person through the disclosure or common general knowledge which provide the same effect for the invention (T 292/85, OJ 1989, 275). This has been confirmed by many decisions, for example: T 81/87 (OJ 1990, 250), T 301/87 (OJ 1990, 335), T 212/88 (OJ 1992, 28), T 238/88 (OJ 1992, 709), T 60/89 (OJ 1992, 268), T 182/89 (OJ 1991, 391), T 19/90 (OJ 1990, 476), T 740/90, T 456/91 and T 242/92.

If a claim comprises non-working embodiments, the consequences differ depending on the circumstances (G 1/03, OJ 2004, 413, citing T 238/88, OJ 1992, 709; T 292/85, OJ 1989, 275, and T 301/87, OJ 1990, 335).

5.3. Examples

Whether or not the disclosure of the patent in suit is sufficiently clear and complete within the meaning of Art. 100(b) and 83 EPC must be decided by appraising the information contained in the examples as well as other parts of the description in the light of the common general knowledge of the skilled person at the priority date (T 322/93 and T 524/01).

However, where the application disclosed the claimed invention in a manner sufficiently clear and complete for it to be carried out by a person skilled in the art, it then necessarily disclosed at least one way of carrying out the invention disclosed in accordance with R. 42(1)(e) EPC, with the necessary details being derivable from the description including the prior art referred to therein (see e.g. T 389/87, T 561/96 and T 990/07). The board in T 990/07 pointed out that, although the case underlying decision T 561/96 differed from that in T 990/07 in that in T 561/96 the description and the drawings were not erroneous, the board in T 561/96 had also held that in cases where examples were not indispensable, their omission did not contravene R. 27(1)(e) EPC 1973 (R. 42(1)(e) EPC). This Rule only required the insertion of such examples "where appropriate". The jurisprudence of the boards of appeal thus drew a clear distinction between the concepts of "way of carrying out the invention claimed" and "examples" referred to in R. 27(1)(e) EPC 1973. According to this jurisprudence, the detailed description of one way of carrying out the invention claimed had to be interpreted in the light of Art. 83 EPC. It constituted a condition to be met by the description as a whole and was clearly mandatory. In contrast, the presence of examples would only be indispensable if the description would otherwise not be sufficient to meet this requirement. Hence, the purpose of the "examples" evoked in R. 27(1)(e) EPC 1973 appeared primarily to be to complete an otherwise incomplete teaching. See also T 1918/07 and T 1169/08.

In T 226/85 (OJ 1988, 336), T 409/91 (OJ 1994, 653) and T 694/92 (OJ 1997, 408) the patent or the patent application disclosed only one or very few ways of carrying out the invention. In each of these decisions the boards had held that the disclosure of the specific examples was not sufficient to enable the invention to be carried out as claimed. However, according to T 617/07, no principle could be deduced from these decisions that sufficiency of disclosure is always to be denied if there is only example of carrying out an invention. Rather all three decisions emphasised that an objection of lack of sufficiency of disclosure (i) presupposes that there are serious doubts, substantiated by verifiable facts, and (ii)

depends on the evidence available in each case whether or not a claimed invention can be considered as enabled on the basis of the disclosure of one worked example.

5.4. Invention to be performed over whole range claimed

The disclosure of one way of performing an invention is only sufficient if it allows the invention to be performed **in the whole range claimed** rather than **only in some** members of the claimed class to be obtained (T.409/91, OJ 1994, 653; T.435/91, OJ 1995, 188; and T.172/99). This is considered a question of fact. Sufficiency of disclosure thus presupposes that the skilled person is able to obtain substantially **all** embodiments falling within the ambit of the claims. This view has been taken by the board in numerous decisions, for example T.19/90 (OJ 1990, 476), T.418/91, T.548/91, T.659/93, T.435/91 (OJ 1995, 188) and T.923/92 (OJ 1996, 564; more recently, issue discussed in detail in T.1727/12 ("Biogen Sufficiency")). This principle applies to any invention irrespective of the way in which it is defined, be it by way of a functional feature or not. The peculiarity of the functional definition of a technical feature resides in the fact that it is defined by means of its effect. That mode of definition comprises an indefinite and abstract host of possible alternatives, which is acceptable as long as all alternatives are available and achieve the desired result (T.1121/03 and T.369/05, see also T.2128/13). With respect to a claimed process defined in a functional manner, i.e. by its outcome, the board in T.1051/09 concluded that what was lacking was a generalisable teaching applicable within the scope of the claims, i.e. beyond the specific examples.

More technical details and more than one example may be necessary in order to support claims of a broad scope (T.612/92, T.694/92, OJ 1997, 408; T.187/93). This must be decided on a case-by-case basis. The board must also be satisfied firstly that the patent specification put the skilled person in possession of at least one way of putting the claimed invention into practice, and secondly that the skilled person could put the invention into practice over the whole scope of the claim. If the board was not satisfied on the first point that one way existed, the second point did not need to be considered (T.792/00).

In T.1064/15, the invention related to barbed suture-needle combinations useful for connecting body tissue in various surgical contexts. Claim 1's requirements could be implemented for circular cross-sections, but the question of sufficiency of disclosure arose for non-circular cross-sections. The respondent (patent proprietor) himself intended the teaching of the patent to be applicable to both circular and non-circular cross-sections and specifically sought protection for both types of embodiment. It would be insufficient and disproportionate if the sole disclosed possibility of carrying out the invention with circular cross-section elongated bodies were enough to satisfy the requirements of sufficiency of disclosure. Such an approach could not have been intended by the legislator, because in the board's view this would go against the general principle that the protection obtained with the patent had to be commensurate with the disclosed teaching. When it came to non-circular cross-sections, this was not the case for the patent in suit. On the basis of the patent disclosure as a whole, taking common general knowledge into account, the person skilled in the art was not able to determine which dimension was meant by the diameter (SD) for an essential part of the claim, or in other words, with a needle having a given diameter, he did not know how to select the cross-section dimension of a non-circular

suture in order to improve the closure strength, which was supposed to be an essential part of the teaching of the patent in suit.

In T. 553/10, the board stated that the passages cited by the appellant disclosed a method for producing lithium nickel manganese cobalt oxides which fell either within or outside the ambit of claim 1. An additional process step required when seeking to prepare oxides falling within the ambit of claim 1 was missing. The application lacked guidance, and this could not be overcome by drawing on common general knowledge. A declaration written by an employee of the appellant was therefore of little probative value for establishing what was common general knowledge in the art.

In T. 239/13 of 5 July 2017, claim 1 as granted did not require the "granules" to be acidic. The board considered that a solution of the claimed granules per se might have an alkaline pH despite the presence of some acidic component. As regards acidic granules, the description – which dealt exclusively with acidic granules – provided the skilled person with technical information and guidance sufficient to enable him to prepare, without undue burden, acidic granules having "improved storage properties" across the whole ambit of claim 1. As regards alkaline granules, in the absence of a concrete teaching the skilled person would have to start a research programme. The board concluded that the skilled person, following the teaching of the description, was not provided with technical information and guidance sufficient to enable him to prepare granules as claimed without undue burden and across the whole ambit of claim 1.

In T. 1994/12 (rubber composition), as to the argument that the requirement for sufficiency of disclosure was not met because the skilled person in view of the ambiguity in respect of the nature of the asphalt would not be able to reproduce the examples of the patent, the board stated that sufficiency of disclosure was not concerned with the invention the applicant might have had in mind when drafting the application, but rather with the invention defined by the claims in terms of the technical features of the invention (see R. 43(1) EPC), as is done for assessing other criteria for patentability such as novelty and inventive step.

See also in this chapter II.C.7.1.2.

5.5. Parameters

If an essential feature of the invention is expressed by a parametric definition, the question is whether the parameter is so defined that the person of the art, on the basis of the disclosure of the patent as a whole and using his common general knowledge, could identify, without undue burden, the technical measures leading to the claimed subject-matter (T. 61/14).

According to T. 517/98, if the disclosure of a patent in suit was limited to products which, when prepared by the method according to the invention, were characterised by distinctive parameters, then a claim which did not stipulate these parameters a priori encompasses embodiments which were not obtainable by the method disclosed. Such disclosure of a single way of performing the invention would only be considered sufficient if it enabled a

person skilled in the art to carry out the invention within the whole ambit of the claim. In T.172/99, the board found that in the case of claimed subject-matter relying on a newly formulated and hence unfamiliar parameter to define the solution of a technical problem by which a relevant effect is achieved, the patentee is under a particular obligation to disclose all the information necessary reliably to define the new parameter not only (i) in a formally correct and complete manner such that its values can be obtained by a person skilled in the art without undue burden, but also (ii) in a manner which reliably retains the validity of the parameter for the solution of the technical problem for the application or patent in suit as a whole in the sense that the values routinely obtained will not be such that the claimed subject matter covers variants incapable of providing the relevant effect or, therefore, of solving the associated technical problem (followed in numerous decisions; see, for example, T.914/01, T.179/05 and T.75/09).

In T.815/07 the board pointed out that the purpose of a parameter contained in a claim is to define an essential technical feature of the invention. Its significance is that the presence of this technical feature contributes to the solution of the technical problem underlying the invention. The method specified for determining the parameter should therefore be such as to produce **consistent values**, so that the skilled person will know when he carries out the invention whether what he produces will solve the problem or not. This decision was cited in T.120/08 and T.593/09. According to the latter decision, what is decisive is whether the parameter is so ill-defined that the skilled person is not able, on the basis of the disclosure as a whole and using his common general knowledge, to identify (without undue burden) the technical measures (e.g. selection of suitable compounds) necessary to solve the problem underlying the patent at issue (see also in this chapter II.C.8.2. "Article 83 EPC and clarity of claims").

In T.147/12, the objection of the appellant (opponent) was not that no method of determination of the alkali metal content in polyethers existed. Rather, the gist of its argumentation was that D7 (scientific publication), D8 (a study) and D11 (experimental report provided by the opponent) showed that the value obtained for the alkali metal content in the polyether depended on the analytical method used for its determination. The board stated that even if the conditions of measurement lead to **variations** of the value of the alkali metal content as argued by the appellant, this **alone did not** constitute a lack of sufficiency of disclosure regarding the claimed subject-matter as a whole since it had not been shown that the uncertainty concerning the alkali metal content affected the claimed process to such an extent that the skilled person wishing to perform the process would face an undue burden. The appellant had shown that the uncertainty concerning the method of determination of the alkali metal content meant that the skilled person could not ascertain whether the value he would obtain was within or outside the claimed range. It was, however, not shown that as a result of that uncertainty, the skilled person would fundamentally be prevented from obtaining a polyether according to claim 1. The board stated that T.83/01 (skilled person not in a position to perform any measurement of the claimed parameter) and T.815/07 (test method defined in claim 1 resulting in totally arbitrary values) were not applicable to the present case.

The fact that no direct independent method of specifically determining the parameter has been described is not in itself prejudicial to the sufficiency of the description where the

claims do not relate to a method of determining the parameter (T. 256/87, case concerning Art. 84 and 83 EPC, compliance of amended claim 1). In T. 83/01 the board held that where the skilled person had no reason to doubt the definition of the parameter given, but there was no indication in the patent how to measure this parameter, the patent failed to fulfil the requirements of Art. 83 EPC 1973. In T. 808/09 (cartridge for use in a beverage preparation machine / liquid chocolate ingredient), the board considered that the patent failed to enable the measurement of the essential parameter of the invention, i.e. the viscosity of the liquid chocolate ingredient. Even if this viscosity feature had been shifted into a preamble of method claim 1 and supposing this preamble had been directed to the prior art, this shifting of the feature would still not have solved the problem of insufficiency. For a reference to prior art in the preamble to adequately serve this purpose the patent in suit still needs to contain all the necessary information in sufficient detail in order to enable the person skilled in the art to perform the invention. In the case before the board this would require information as to the viscosity measurement device to be used and the parameters to be observed. All this information was missing. The board's decision, taken in line with the long-standing jurisprudence, cited T. 805/93 (dealing with viscosity measurement at "room temperature"), T. 83/01 and T. 1250/01 (both concerning the measurement of an essential parameter).

In T. 2096/12 the skilled person could not know, from the disclosure in the patent, which measurement method should be employed to establish the claimed thickness parameter. The board agreed with the statements in T. 593/09 and emphasised that the absence of a test method for a parameter which was a claimed feature did not lead by itself to the issue of insufficient disclosure. In a case where, for example, ranges for length or width of a clearly structured article were concerned, the parameters could be established unambiguously and without doubt. However, in each case it had to be evaluated on a case by case basis whether this was possible. When the extent of the protection conferred by the patent is not defined and cannot be reliably determined – such as in the case at issue where neither the claims nor the description provided a clue for how to interpret the parametrical feature of the claim, it can only be concluded that the requirement of Art. 100(b) EPC was not met.

In T. 1064/15 the person skilled in the art was faced with the undefined parameter "diameter (SD)" and did not know how to choose the cross-section in order to obtain the desired technical effect. For the conditions of sufficiency of disclosure to be fulfilled it is not enough to be able to manufacture an object falling under the wording of a claim. That object must also exhibit the alleged or desired technical effect obtained with that invention (T. 815/07). The field of non-circular cross-sections is far wider than that of circular ones, since it encompasses an enormous variety of shapes. This made it even more important to know how the key parameter of such shapes, namely the diameter, was determined.

The board in T. 602/10 found that the proprietor had deliberately decided to use a method for determining rugosity which was different from the one commonly used in the state of the art. It was therefore its duty to provide full information with regard to the means and the procedures for implementing said method. In general terms, when the issue of sufficiency concerned the description of a method for determining a parameter, the less common the method the more accurate the information provided in the description should

be. In the case at issue, in the absence of any known prior-art work applying the same method used in the patent for measuring the rugosity, the skilled person had to rely primarily on the teaching of the patent to put the method into practice.

Where the calibration of (undisclosed) test conditions may be achieved although the methods of determination of the parameter are incompletely described, the invention may be sufficiently disclosed. See for example T 1062/98. In both T 485/00 and T 225/93, three methods were known in the art for the determination of the specific surface area of a CaCO₃ particle. In neither case did the description or common general knowledge indicate a preference for one of them. In T 485/00, the board held that reproducing an example and measuring the surface area of the resulting product by two or three well-known methods did not represent an undue burden for the skilled person. In T 225/93, however, the board found that, as there were three different measuring methods which did not always lead to the same result, this amounted to an undue burden.

In T 417/13, the board stated that in the case underlying decision T 225/93 the prior art contained no indication of which method of measurement was suitable in particular for the calcium carbonate particles under consideration. Unlike the situation in T 225/93, in the present case it was determined that one particular method of measurement would have been chosen by the skilled person. Then the board in T 417/13 concluded that in the present case of PVC particles the skilled person would not have considered using any method of measurement, but would have chosen a method relying on sieving, such as a method according to ISO standard 1624. There was no evidence on file that different measurement conditions in such a method would have led to the selection of PVC particles that would have prevented the skilled person from carrying out the invention as defined in the claims.

In T 641/07 the board held, citing T 485/00, that when a skilled person was enabled to reproduce the invention, and it was sufficient for him to reproduce one of the examples in order to identify the method employed to measure the value of a parameter, there was no insufficiency in the description since the identification procedure in question could not be regarded as involving an undue burden. In T 1712/09, the board held that the opponent had failed to prove that the method of measuring the parameters was unworkable. The tests referred to in its experimental reports had been carried out using measuring apparatus different from that described in the patent, and so not as instructed there. The board found that no attempt had been made to reproduce the invention (no attempt at calibration), which was the first condition for an objection under Art. 100(b) and 83 EPC. It cited T 815/07 (need for consistent values) and T 1062/98 and T 485/00 (possibility of calibrating methods of determining the relevant parameters). The board in T 548/13 held that the case law on parameters (which included T 815/07) did not apply since the case before it did not concern a quantitative parameter.

In T 45/09 too, the opponent's test conditions were called into question since the tests had been carried out using a commercially available product. Observing that two products of the same brand but available on the market at different times would not necessarily have the same properties, the board found that it had not been established that the properties had been the same in this specific case. The board also considered the issue of calibrating

the method of measuring the parameter. The board concluded that the opponent had failed to show that the method of measuring the parameter could not be reproduced and thus to prove insufficient disclosure. It was, indeed, for the opponent to do so, and it could have discharged its burden of proof by attempting to reproduce the method using at least one of the claimed silica.

Where it is obvious that a skilled person would select a particular analytical measuring method, (none being disclosed in the patent), balancing its simplicity and convenience against the required accuracy, the requirements of Art. 83 EPC are met (see e.g. T. 492/92). This differed substantially from the case considered in decision T. 466/05. In T. 492/92 it was considered that the fact that two methods suggested by the appellant did not necessarily lead to identical results when measuring a specific parameter was not sufficient evidence that a skilled person could not determine this parameter of the claimed compositions with the required accuracy. In T. 466/05, the skilled person did not even know which parameter should be determined and the invention was insufficiently disclosed.

The board in T. 2403/11 acknowledged that an ambiguity of a parameter in the claim was not enough in itself to deny sufficiency of disclosure. Whether such an ambiguity led to insufficiency of disclosure was to be decided on a case-by-case basis (see T. 593/09 and T. 472/14). The case at issue was different from T. 882/03, which also concerned viscosity and where the variations resulting from the ambiguity were only minor, and from T. 492/92, where the skilled person knew which method to choose. In T. 2403/11 the method and the measurement parameters to be chosen were not known to the skilled person. T. 482/09 also concerned a method of measuring viscosity (see also T. 808/09 and T. 805/93 supra). In T. 1697/12 the claims covered, through open-ended ranges, embodiments that could not be obtained with the process disclosed in the patent, but which might be obtainable with different methods still to be invented in the future (insufficiently disclosed invention).

Where inventions are defined by claims containing unclear features, e.g. **ambiguous parameters**, which cannot be clarified in the light of the description, the effect sought may be the only means of understanding such inventions. This effect must then be taken into consideration and assessed under Art. 83 EPC with a view to establishing whether the invention can be reproduced (see T. 862/11).

See the very recent decision T. 1845/14 (ambiguous parameter; see catchword – this decision addressed several issues).

See also in this chapter II.C.8.2.

6. Reproducibility

6.1. Repeatability

In T. 281/86 (OJ 1989, 202), it was held that there is no requirement under Art. 83 EPC 1973 according to which a specifically described example of a process must be exactly repeatable. Variations in the constitution of an agent used in a process are immaterial to the sufficiency of the disclosure provided the claimed process reliably leads

to the desired products. See also T.292/85 (OJ 1989, 275); T.299/86 (OJ 1988, 88); T.181/87, T.212/88 (OJ 1992, 28); T.182/89 (OJ 1991, 391) and T.19/90 (OJ 1990, 476).

In G.1/03 (point 2.5 of the Reasons) the Enlarged Board of Appeal indicated that a lack of reproducibility of the claimed invention is relevant under the requirements of sufficiency of disclosure if the technical effect is a technical feature of the claim, since then it is a feature characterising the subject-matter claimed (T.1079/08). A lack of reproducibility of the claimed invention (i.e. a failure of the claimed features to deliver the effect aimed for) is seen to represent, in the case of an effect which is not expressed in a claim but is part of the problem to be solved, "a problem of inventive step". If an effect is expressed in a claim, there is lack of sufficient disclosure (G.1/03, OJ, 2004, 413, and T.939/92, OJ 1996, 309, cited by T.2001/12; and more recently in T.1845/14).

6.2. Hypothetical embodiments

In T.515/00 the board pointed out that an invention cannot be considered to be irreproducible merely because a claim encompasses a hypothetical embodiment which lies outside the breadth of the claim as determined by the Protocol on the Interpretation of Art. 69 EPC 1973, which embodiment cannot be reproduced (endorsed in T.519/07).

6.3. Variants

If the only embodiment disclosed with concrete details in a patent is not disclosed in a manner sufficiently complete for the claimed invention to be carried out by a person skilled in the art on the date of priority with respect to the fundamental scope of said invention, it is of no significance with regard to the question of sufficient disclosure whether on the relevant date of filing a variant could have been carried out if the variant, although it is covered by the wording of the patent claim, does not fall within the fundamental scope of the claimed invention with regard to the teaching of the patent due to a lack of comparable technical success (T.1173/00, OJ 2004, 16).

The board went on to state that if an invention is insufficiently disclosed, it is of no relevance whether it was objectively impossible to provide the **missing information** on the date of priority. The decisive issue is whether the invention is disclosed in a manner sufficiently complete for it to be carried out by an average person skilled in the art on the date of priority, with knowledge of the patent and on the basis of that person's common general knowledge.

6.4. Use to which invention is put

Where a disadvantage of an invention (in this case the risk of injury to users) could prevent its use, this is not an obstacle to reproducibility provided that the otherwise desired result is achieved by the technical teaching disclosed in the patent in suit (T.881/95, see also T.468/09). An Art. 83 EPC objection concerning the absence of any detailed indication of the **use** envisaged for the products cannot succeed, as Art. 83 EPC merely requires the invention to be sufficiently disclosed (see e.g. T.866/00).

6.5. Reach-through claims

In T.1063/06 (OJ 2009, 516) the board held that a formulation of a claim whereby functionally defined chemical compounds were to be found by means of a new kind of research tool using a screening method set out in the description constituted a reach-through claim which was also directed to future inventions based on the one now being disclosed. The applicant was entitled to claim patent protection only for his actual contribution to the art and not to reserve an unexplored field of research.

6.6. Reproducibility without undue burden

The disclosure must be reproducible without undue burden.

6.6.1 Occasional failure

It suffices for the disclosure of an invention that the means intended to carry out the invention are clearly disclosed in technical terms which render them implementable and that the intended result is achieved at least in some, equally realistic, cases (T.487/91). The occasional failure of a process as claimed does not impair its reproducibility if only a few attempts are required to transform failure into success, provided that these attempts are kept within reasonable bounds and do not require an inventive step (T.931/91). The skilled person is used to occasional failures when testing a technical teaching (T.14/83, cited in T.1133/08).

A claim is an attempt to define a device in terms of ideal conditions, i.e. those required for its theoretically optimal or nominal operation. However, when considering a claim, the skilled person will readily understand that the conditions of actual operation will not be the ideal ones defined there. In T.383/14 (sorting table for grape harvest), the board found that, on reading the claim at issue, the skilled person would immediately grasp how the table would operate **in practice** after a harvest and so understand its terms in a sense compatible with the actual operation of all mechanical devices, whose reliability or success rate was always less than 100% and even lower in the specific case of sorting or grading.

The board in T.38/11 summarised the case law for making a case of insufficiency of disclosure (identifying gaps in information), and in the case at issue stated that the appellant (patentee) itself argued that a synergistic effect of a composition depended on a range of parameters and was rather an exceptional situation. As such parameters were not disclosed, it followed that the patent did not suffer from an occasional failure, but from a lack of a concept fit for generalisation. The situation may be aptly denoted as an invitation to carry out a research programme, based on trial and error, with limited chances of success (see T.435/91 (OJ 1995, 188) and T.809/07). In accordance sufficiency of disclosure could not be acknowledged.

6.6.2 Routine selection

Reproducibility is not impaired if the selection of the values for various parameters is a matter of routine and/or if further information is supplied by examples in the description (T 107/91).

The board in T 764/14 concluded that the skilled person was able, based on common general knowledge and corresponding routine variation of experimental conditions, to complement the information contained in paragraph [0031] of the patent in suit and, thus, to determine (possibly with some slight uncertainty but) without undue burden the surface Na baseline value for a given carrier.

6.6.3 Wrong citations

Wrongly citing a method of measuring an essential product parameter may constitute insufficient disclosure (T 1250/01, applied in T 484/05 (unusual parameter)). In T 1250/01 the consequence of an error in the description was that no method for measuring an essential parameter was disclosed and, thus, the skilled person was not able to make any measurement of the relevant essential parameter (decision cited in T 206/08 (detergent compositions) but found inapplicable to the case in hand).

6.6.4 Forbidden area of the claims

As today there is a clearly predominant opinion among the boards that the definition of the "forbidden area" of a claim should not be considered as a matter related to Art. 83 and 100(b) EPC (T 646/13). See also chapter II.C.8.2. "Article 83 EPC and clarity of claims".

T 256/87, followed in T 387/01, T 252/02, T 611/02 and T 464/05 form part of a line of jurisprudence established between 2004 and 2007, which has not been generally followed since then (cf. nevertheless recent T 626/14 which concerns T 464/05, and even more recently T 250/15, which held that T 626/14 did not challenge the case law. T 250/15 declined to make a referral to the Enlarged Board and considered that T 626/14 and T 464/05 concerned a particular constellation in a certain technical field).

According to T 256/87 all that has to be ensured is that the skilled person reading the specification will be able to carry out the invention in all its essential aspects and know when he is working within the forbidden area of the claims. The possibilities of indirect empirical investigation referred to in the specification were, in the board's view, an acceptable solution which sufficed to fulfil the requirements of Art. 83 EPC 1973 without undue burden. This decision was followed in T 387/01, T 252/02, T 611/02 and T 464/05.

However, according to more recent decisions, the concept of 'forbidden area' was rather associated with the scope of the claims, i.e. Art. 84 EPC, than with sufficiency of disclosure (see in this chapter II.C.8.2., T 619/00, T 943/00, T 396/02, T 1033/02, T 452/04, T 466/05, T 1015/06, T 1250/08, T 593/09, T 1507/10, T 2331/11, T 2290/12, T 1811/13, T 647/15).

T. 464/05 is one of a small number of decisions in which the boards found that a lack of clarity as to the scope covered by the claims resulted in insufficient disclosure for the purposes of Art. 83 EPC. These decisions have since been called into question on a number of occasions. The board in T. 548/13 referred to T. 2290/12, T. 1811/13 and T. 647/15 for a detailed discussion of the issues involved. Decision T. 464/05 forms part of a line of jurisprudence established between 2004 and 2007, which has not been generally followed since then (T. 646/13).

In T. 626/14, the questioning of case law in T. 1811/13, in particular of T. 464/05, was addressed. T. 1811/13 and T. 647/15 did not cause the board in T. 626/14 to see anything which would undermine the reasoning in T. 464/05 concerning Art. 83 EPC. T. 1811/13 and T. 647/15 concentrated only on an individual aspect in T. 464/05, namely "the area covered by the claim", without addressing the actual findings in that decision regarding Art. 83 EPC. T. 464/05 drew a distinction between the two objections under Art. 83 and 84 EPC respectively and explained the significance thereof. For example, T. 464/05 did not consider the boundaries of the claimed subject-matter which were the subject of T. 1811/13 and T. 647/15, but the lack of indications in the patent concerning the measurement of a particular parameter. In case T. 626/14 (thickness of fibrous composite – variability in measurement caused by the ill-defined "surface" of the composite), according to the board, an indication of what the pressure should be, in order to enable a reliable and repeatable thickness measurement to be made, was lacking such that the skilled person would not know when a product according to the invention has been arrived at, the defined parameter lacking a sufficiently defined technical meaning within the technical field concerned. The board stated that this finding was in line with established case law (T. 464/05, T. 2096/12). See T. 250/15.

In T. 1886/06 the board emphasised that the finding in T. 256/87 could not mean, conversely, that if the claims used a term undefined under Art. 84 EPC 1973 the invention necessarily became impossible to carry out within the meaning of Art. 83 EPC 1973 in the absence, in the description or the common general knowledge of the skilled person, of concrete indications towards a possible definition; doubts as to the claims' reproducibility over their entire scope had to be substantiated by verifiable facts. A mere conjecture that their scope might extend to undisclosed variants was not enough. In T. 482/09, the board addressed this same issue in detail and stated in particular that whether a competitor could know that he was working within the forbidden area of the claims depended at most on whether the claims were worded clearly enough to satisfy Art. 84 EPC. Art. 83 EPC, by contrast, made no mention of the scope of protection conferred by the claims of the patent.

In T. 147/12 the board stated that the appellant had shown that the uncertainty concerning the method of determination of the alkali metal content meant that the skilled person could not ascertain whether the value he would obtain was within or outside the claimed range. It was, however, not shown that as a result of that uncertainty, the skilled person would fundamentally be prevented from obtaining a polyether according to claim 1.

6.6.5 Non-disclosed steps

There is no requirement in the EPC that the claimed invention may be carried out with the aid of only a few additional non-disclosed steps. The only essential requirement is that each of those additional steps be so apparent to the skilled person that, in the light of his common general knowledge, a detailed description of them is superfluous (**T. 721/89**).

6.6.6 Machine not available

In **T. 1293/13** the claims limited the determination of air permeability of the garment to a particular method and to a particular machine ("Frazier 750"). However, the machine "Frazier 750" no longer existed, such that this machine could not be used for determination of the claimed values. The insertion of a feature defined as determinable by a specific machine which possibly was not – but certainly is no longer – publicly available, leads in this case to the invention not being disclosed in a manner sufficiently clear and complete for it to be carried out by a person skilled in the art.

6.6.7 Experiments

The legislative purpose of Art. 83 EPC is to ensure that the skilled person can reproduce the invention without his own research or undue experimentation. Experiments are an undue burden if their primary aim is to find the solution to the problem but not if they are carried out merely to determine the numerical limits of a functionally defined range (**T. 312/88**). They should quickly give a reliable picture of how the products can be produced or manufactured (**T. 475/88**). However, it is not necessary for the experimental data filed with the patent in suit to be an exact repetition of the worked examples of the patent, as long as the experimental work can be regarded as being within the scope of the invention (**T. 674/96**).

For experiments to be considered reasonable, the application need not disclose the best and easiest method; a long and complicated route which is nevertheless clearly successful may be considered reasonable (**T. 412/93**).

The board in **T. 1133/08**, faced with a multitude of options for selecting suitable materials, dimensions and procedural parameters which were merely outlined in the part of description relating to embodiments, found that there was no specific information describing in detail at least one way of carrying out the invention claimed. Experiments were needed to solve the problem (i.e. identify parameters and conditions resulting in a sinusoidal profile), and, as established in **T. 312/88** in conjunction with **T. 68/85** and **T. 18/89**, such experimentation had to be considered unduly burdensome. If an invention had several variants, it was very important first of all to describe as many as possible in detail, rather than merely outlining them, to show the skilled person that the invention could be carried out in practice across the entire breadth of the claims. Here, not one single way of carrying out the invention was apparent, nor had any subsequently been demonstrated, e.g. on the basis of experiments. The board also analysed **T. 14/83**, contrasting it with **T. 412/93** (genetic engineering).

6.6.8 Measuring methods

Where it is obvious that a skilled person would select a particular analytical measuring method, (none being disclosed in the patent), balancing its simplicity and convenience against the required accuracy, the requirements of Art. 83 EPC are met (see e.g. T. 492/92). This is the case even if the two different analytical methods proposed by the patentee give significantly different results with the same composition. It also suffices if the person skilled in the art would assume that it was most likely that a certain method was used and this assumption could be tested in the light of the information given in the examples of the patent in suit (T. 143/02). However, where there are different measuring methods which do not always lead to the same result, this can amount to an undue burden, as in T. 225/93. In T. 930/99, the board considered T. 225/93 inapplicable, as there was only one measurement method before them. The respondent's argument that there would be legal uncertainty, since third parties would not know whether they were working within or outside the range specified, was clearly an argument based on lack of clarity, which was not a ground of opposition and so could not be considered (see also in this chapter II.C.8.2.).

6.6.9 Chemical compounds

According to T. 954/05, the structural definition of a chemical compound may not be replaced in a claim by the mere juxtaposition of a feature purportedly representing a complete chemical structure and of a functional feature if on the one hand the first feature comprises an indefinite number of compounds and there is no systematic selection rule based on the feature in question enabling the skilled person to identify the claimed compounds, and on the other hand the second, functional feature is not identifiable in the indefinite list of compounds potentially suitable for such a function because there is no indication of a typical standardised test for determining its presence or absence.

In T. 544/12 the board confirmed that a definition of a group of compounds in a claim by both structural and functional features is generally acceptable under Art. 83 EPC as long as the skilled person is able to identify, without undue burden, those compounds out of the host of compounds defined by the structural feature(s) in the claim which also fulfil the claimed functional requirements (following T. 435/91 and T. 1063/06). In T. 544/12 it was up to the skilled person to identify within the almost infinite host of alternatives covered by the structural definition of claim 1 those compounds that were phosphorescent. Claim 1 extended to classes (of iridium complexes) that were entirely different from the concept as argued by the proprietor (non-compliance with Art. 83 EPC). The board did not share the view taken by the German Federal Court of Justice (Bundesgerichtshof) in its decision of 11 September 2013 (X ZB 8/12).

The very detailed decision T. 842/14 concerned a chemical composition of a product designated by a **trademark** (see also T. 270/11 and T. 623/91). According to T. 667/94, T. 325/13, and T. 1383/10, when the products designated by trademarks are essential for carrying out the invention, the requirements of Art. 83 EPC are fulfilled if these products are available to the skilled person not only at the priority and filing dates of the patent but also during its **whole lifetime** (in T. 842/14 no certainty that the composition would remain

unchanged). In this respect T 842/14 contains extensive reasoning on the distinction between the requirements of Art. 83 EPC and those of Art. 54 EPC (especially in view of G 1/92, OJ 1993, 277).

6.7. Trial and error

Even though a reasonable amount of trial and error is permissible when it comes to sufficiency of disclosure, e.g. in an unexplored field or where there are many technical difficulties, the skilled person has to have at his disposal, either in the specification or on the basis of common general knowledge, adequate information leading necessarily and directly towards success through the evaluation of initial failures (T 226/85, OJ 1988, 336; following T 14/83, OJ 1984, 105; T 48/85, T 307/86 and T 326/04; see also T 2220/14, highly complex technical field). Where the skilled person can only establish by trial and error whether or not his particular choice of numerous parameters will provide a satisfactory result, this amounts to an undue burden (T 32/85). Nor can sufficiency of disclosure be acknowledged, if, for an invention which goes against prevailing technical opinion, the patentee fails to give even a single reproducible example (T 792/00. See also T 397/02, T 1440/07 and T 623/08).

In case T 2220/14, in the board's view, since the technical field to which the invention related was highly complex (methods of modifying eukaryotic cells), the average amount of effort necessary to put a written disclosure into practice in this field would be rather high and involve a considerable amount of trial and error. The board added that there is no requirement in the EPC, either at the priority or filing date, that the applicant must have carried out the claimed invention. The board concluded that it had no reason to doubt that the invention as claimed in claims 1, 5 and 6 was sufficiently disclosed as required by Art. 83 EPC.

Where the person skilled in the art has to find out by trial and error which, if any, compound meets the parameter set out in the claim, this constitutes an undue burden. The fact that this could be done by routine experimentation was not sufficient for the subject-matter claimed to meet the requirements of Art. 83 EPC. Nor did the question whether or not the parameter could be reliably determined play a role (T 339/05). In T 123/06 the board found that the **functional definition** of the device was no more than an invitation to perform a research programme, the skilled person only being able to establish through trial and error whether the claimed device was achieved. This amounted to an undue burden.

According to T 1063/06 (OJ 2009, 516), a functional definition of a chemical compound (in this case in a **reach-through claim**) covered all compounds possessing the capability according to the claim. In the absence of any selection rule in the application in suit, the skilled person, without the possibility of having recourse to his common general knowledge, had to resort to trial-and-error experimentation on arbitrarily selected chemical compounds to establish whether they possessed the capability according to the claim; this represented for the skilled person an invitation to perform a **research programme** and thus an undue effort (following T 435/91). See also T 1140/06.

Following T. 1063/06, the board held in T. 852/09 that since the enhancers to be used were characterised in functional terms only and the claim merely represented for the skilled person an invitation to perform a research programme, he/she could not carry out the invention within the entire scope claimed without undue burden (see also T. 155/08).

In T. 2070/13 the board indicated in its preliminary opinion that an adequate test method for anti-adherence was lacking and that no suitable compounds were defined within the claimed families of compounds. In particular, the argument of the respondent (patent proprietor) that the skilled person could carry out the invention by way of routine optimisation using standard procedures was not convincing. The board stated that no standard procedure was disclosed in the patent in suit and none was referred to during the whole proceedings. Even if a specific model test procedure were used to determine the anti-adherence, this did not significantly reduce the extent of the experimental programme required to identify the appropriate anti-adherent materials. The board concluded that the skilled person was unable to identify suitable materials displaying anti-adherence due to the large number of potential materials listed, several of these listed materials also describing large families of compounds; the skilled person would be faced with an experimental programme in order to establish which of the listed materials satisfied the claimed criterion of anti-adherence.

If the patent claims require that a specific aim should be achieved (in this case, that a specific value of a parameter should not be reached), then there is no guarantee that the invention can be carried out in accordance with Art. 100(b) EPC if the patent affords the skilled person no clue as to how he can achieve this aim outside the scope of the embodiments without an undue burden of research (T. 809/07).

6.8. Post-published documents

In the absence of any tangible proof in the patent specification that the claimed concept can be put into practice, post-published documents can be used as evidence whether the invention merely disclosed at a general conceptual level was indeed reproducible without undue burden at the relevant filing date (T. 994/95 and T. 157/03). In T. 1262/04 of 7 March 2007, the board considered that this principle applied at least to cases such as the one at issue, where the technical teaching as disclosed in the application was credible. In T. 1205/07, the post-published documents were considered, as the evidence they provided was not aimed at "curing" any alleged insufficiency of disclosure, but rather at confirming the teachings of the application. See also T. 1547/08.

Even though sufficiency of disclosure must, in principle, be established at the priority date, post-published documents can be used as evidence that the claimed concept can be put in practice. Accordingly, the board decided to consider documents in spite of their late filing (T. 1164/11).

If a disclosure is seriously insufficient in that it provides no guidance for performing a particular aspect of the invention, a reference to later documents showing how such performance was accomplished at a later date is manifestly incapable of curing the insufficiency (T. 222/00). Sufficiency of disclosure must, in principle, be shown to exist at

the effective date of a patent. If the description of the patent specification provides no more than a vague indication of a possible medical use for a chemical compound yet to be identified, later more detailed evidence cannot be used to remedy the fundamental insufficiency of disclosure of such subject-matter (T. 609/02). The disclosure in post-published documents can only be taken into account for the question of sufficiency of disclosure if it was used to back up the positive findings in relation to the disclosure in a patent application (T. 1273/09 citing T. 609/02). Post-published evidence may be taken into account, but only to back-up the findings in the application in relation to the use of the compound(s) as a pharmaceutical (T. 609/02, T. 950/13, see in this chapter II.C.7.2.).

In case T. 1329/11 the respondents (patent proprietors) referred to post-published documents, in particular to document D8 published more than five years after the priority date, in order to show that the claimed method worked. The contents of documents which were not available to the skilled person at the priority date could not help to overcome the major problem of sufficiency of disclosure of the claimed invention at the priority date.

In T. 2070/13 the board observed that D16 – a patent specification – failed to provide any guidance as to how anti-adherence might be determined; the document was post-published with respect to the patent in suit and its disclosure was thus of no relevance to the sufficiency of disclosure thereof.

In T. 1255/11 the board was satisfied that the application as filed provided a complete theoretical explanation, backed up by scientific literature, for the treatment of Alzheimer's disease by MCT. Since the presence of the claimed effect was made plausible by the theoretical background explanations provided in the application as filed, the appellant (patent proprietor) might provide post-published evidence.

See also in this chapter II.C.7.2. "Level of disclosure required for medical use – plausibility".

7. The requirement of sufficiency of disclosure in the biotechnology field

7.1. Clarity and completeness of disclosure

7.1.1 General

The principles elucidated under chapter II.C.4. and 5. above are also applicable to biological inventions. In particular, reference should be made to the case law laid down by the boards in T. 281/86 (OJ 1989, 202), T. 299/86 of 17 August 1989 and T. 409/91 (OJ 1994, 653). Issues related to completeness of disclosure are also discussed by the boards in context with inventive step (see e.g. T. 1329/04, T. 604/04, T. 898/05) and industrial applicability (see e.g. T. 870/04, T. 641/05, T. 1452/06, above chapter I.E.). Whether the application discloses sufficient information making it plausible that the claimed polynucleotides or polypeptides have the alleged technical effect was considered a matter of inventive step (T. 743/97; T. 1329/04) or industrial applicability (T. 1165/06, T. 1452/06), whereas the relevant question under Art. 83 EPC 1973 was whether the

description was sufficiently clear and complete for the skilled person to prepare the claimed products (T. 743/97).

In T. 449/90, the board considered that the requirements of Art. 83 EPC 1973 had been satisfied where the claimed degree of inactivation ("substantially") of the Aids virus could be demonstrated with sufficient certainty. Complete inactivation of the life-threatening virus – which the opponent had argued was necessary – was indeed highly desirable, but not an issue under Art. 83 EPC 1973, given the claim as worded.

7.1.2 One way of implementing invention over whole scope of claim

When examining sufficiency of disclosure, the boards have to be satisfied, firstly, that the patent specification places the skilled person in possession of **at least one way** of putting the claimed invention into practice, and secondly, that the skilled person can put the invention into practice **over the whole scope of the claim** (see e.g. T. 792/00, T. 811/01, T. 1241/03, T. 364/06; see also T. 1727/12, "Biogen sufficiency"). The scope of the patent should be justified by the technical contribution to the art (T. 612/92). The necessary extent of disclosure is assessed on a case-by-case basis having regard to the essence of the invention (T. 694/92, OJ 1997, 408).

In T. 292/85 (OJ 1989, 275) the board stated that an invention is regarded as sufficiently disclosed if at least one way is clearly indicated enabling the skilled person to carry out the invention. The invention at issue concerned a recombinant plasmid comprising a homologous regulon, heterologous DNA and one or more termination codons for expression in bacteria of a functional heterologous polypeptide in recoverable form. The application was refused by the examining division on the grounds that not all embodiments falling within the broad functional wording of the claims were available. The board, however, held that the non-availability of some particular variants was immaterial as long as there were suitable variants known which provided the same effect.

Similarly, in T. 386/94 (OJ 1996, 658) the patent specification provided a technically detailed example for the expression of preprochymosin and its maturation forms in *E. coli*. It suggested the possibility of expressing these proteins in micro-organisms in general. The board held that the invention was sufficiently disclosed because one way to carry out the invention was clearly indicated and the state of the art contained no evidence that foreign genes could not be expressed in organisms other than *E. coli*. The principles set out in T. 292/85 (OJ 1989, 275) were also applied in T. 984/00 (where the invention lay in the use of the T-region of the *Agrobacterium* without the genes of the T-region of wild type Ti-plasmids to avoid the deleterious effects of these genes on the target plant) and in T. 309/06 (where the appellant had disclosed a novel group of enzymes characterised by useful properties and the board allowed the appellant to claim the enzymes independently of their origin).

As for the amount of detail needed for a sufficient disclosure, this depends on the correlation of the facts of the case to certain general parameters, such as the character of the technical field and the average amount of effort necessary to put into practice a certain written disclosure in that technical field, the time when the disclosure was presented to the

public and the corresponding common general knowledge, and the amount of reliable technical details disclosed in a document (see T.158/91; T.694/92, OJ 1997, 408; T.639/95; T.36/00; T.1466/05; T.2220/14).

7.1.3 Repeatability

An invention may also be sufficiently disclosed where results are **not exactly repeatable**. Variations in construction within a class of genetic precursors, such as recombinant DNA molecules claimed by a combination of structural limitations and functional tests, were immaterial to the sufficiency of disclosure provided the skilled person could reliably obtain some members of the class without necessarily knowing in advance which member would thereby be made available (T.301/87, OJ 1990, 335).

The claimed subject-matter in T.657/10 included an "elite event", i.e. a particular event resulting from a random method (for which the expectations always range from nil to high) and having at least one surprising, advantageous property. There was ample jurisprudence of the boards of appeal on "elite events". Although the specific random methods and resulting products with (normal) average properties might well be known in the prior art, the presence of a particular product with an unexpected advantageous property might justify the recognition of an inventive step. However, the disclosure has to enable a skilled person to obtain the particular product resulting from the "elite event" without the need to repeat the random method *de novo*, i.e. he must be able to obtain the particular product without having to rely on pure chance again. In the case before the board these requirements were not fulfilled.

7.1.4 Broad claims

In some cases, more technical details and more than one example were found necessary in order to support claims of a broad scope, for example where the essence of the invention was the achievement of a given technical effect by known techniques in different areas of application and serious doubts existed as to whether this effect could readily be obtained for the whole range of applications claimed, more technical details and more than one example may be required (see T.612/92; T.694/92, OJ 1997, 408; T.187/93 and T.923/92). In T.694/92 incomplete guidance was given. The claimed subject-matter concerned a method for genetically modifying a plant cell. In fact, the board held that the experimental evidence and technical details in the description were not sufficient for the skilled person to reliably achieve, without undue burden, the technical effect of expression in any plant cell of any plant structural gene under the control of any plant promoter. Further cases, where more than one example was required, may be found in this chapter II.C.7.4.

An application may only be objected to for lack of sufficient disclosure if there are **serious doubts, substantiated by verifiable facts**. The mere fact that a claim is broad is not in itself a ground for considering that the application does not comply with the requirement that it be sufficiently disclosed under Art. 83 EPC (see e.g. T.19/90, OJ 1990, 476; T.612/92, T.309/06 and T.617/07; see also T.351/01, T.21/05, T.1188/06, T.884/06 and T.364/06). In T.19/90 the claimed invention was defined by the incorporation of an

activated oncogene sequence into the genome of non-human mammalian animals in general. The examining division refused the application on the grounds that in the light of the differences among different animals, it could not be assumed that the sole example given – mice – could be extended to all other non-human mammalian animals and the claims were thus unrealistically broad. The board disagreed.

However, in T 636/97 it was emphasised that it is a fundamental principle of patent law that a claim can validly cover broad subject-matter, even though the description of the relevant patent does not enable every method of arriving at that subject matter to be carried out. Otherwise no dominant patent could exist, and each developer of a new method of arriving at that subject matter would be free of earlier patents. In T 694/92 (OJ 1997, 408) the board held that, where an invention relates to the actual realisation of a technical effect anticipated at a theoretical level in the prior art, a proper balance must be found between, on the one hand, the actual technical contribution to the state of the art by said invention, and, on the other hand, the terms in which it is claimed, so that, if patent protection is granted, its scope is fair and adequate. The board highlighted the interrelation between the requirements of Art. 84, 83 and 56 EPC 1973. See also T 187/93.

7.2. Level of disclosure required for medical use – plausibility

It is established case law of the boards of appeal for a medical use claim to fulfil the requirements of Art. 83 EPC, unless this is already known to the skilled person at the priority date, that the patent has to disclose the suitability of the product to be manufactured for the claimed therapeutic application. A claimed therapeutic application may be proven by any kind of evidence as long as it reflects the therapeutic effect on which the therapeutic application relies (see T 814/12). In T 814/12 the board considered that by analogy the same requirements of Art. 83 EPC applied for diagnostic use claims.

In T 609/02 the board pointed out that where a therapeutic application is claimed in the form allowed by the Enlarged Board of Appeal in G 5/83 (OJ 1985, 64), i.e. in the form of the use of a substance or composition for the manufacture of a medicament for a defined therapeutic application, attaining the claimed therapeutic effect is a functional technical feature of the claim (see G 2/88, OJ 1990, 93, and G 6/88, OJ 1990 114, for non-medical applications). As a consequence, under Art. 83 EPC, unless this is already known to the skilled person at the priority date, the application must disclose the suitability of the product to be manufactured for the claimed therapeutic application (summaries of the points established by these decisions as regards claimed therapeutic effects can be found in, for example, T 2571/12, point 5.2 of the Reasons, and T 1437/07, reported below, point 37 of the Reasons).

The requirement of sufficiency of disclosure is considered as fulfilled with respect to a claim to a second medical use if the disclosure in the patent or the common general knowledge enables the skilled person to obtain the compound to be applied and to apply it, and if there is evidence that the intended therapeutic effect can be achieved (T 1437/07 – Botulinum toxin).

Either the application must provide suitable evidence for the claimed therapeutic effect or it must be derivable from the prior art or common general knowledge. The disclosure of experimental results in the application is not always required to establish sufficiency, in particular if the application discloses a **plausible** technical concept and there are no substantiated doubts that the claimed concept can be put into practice (T 950/13 citing T 578/06).

Any kind of experimental data have been accepted by the boards. It has also been repeatedly emphasised that "it is not always necessary that results of applying the claimed composition in clinical trials, or at least to animals are reported" (T 1273/09 citing T 609/02).

If the description in a patent specification provides no more than a vague indication of a possible medical use for a chemical compound yet to be identified, more detailed evidence cannot be used later to remedy the fundamental insufficiency of disclosure of such subject-matter (T 609/02). Where the therapeutic effect is a functional technical feature of the claim, the application must disclose the suitability of the product to be manufactured for the claimed therapeutic application and evidence filed later cannot be used to remedy a fundamental insufficiency of disclosure (point established in T 609/02, as summarised in T 1045/13).

Referring to T 609/02, the board in T 433/05 recalled that where a therapeutic application was claimed in the Swiss-type form, attaining the claimed therapeutic effect was a functional technical feature of the claim. As a consequence, under Art. 83 EPC 1973 the application had to disclose the suitability of the product to be manufactured for the claimed therapeutic application (see also T 1685/10). Note, however, that according to G 2/08 (OJ 2010, 456), where the subject matter of a claim is rendered novel only by a new therapeutic use of a medicament, such claim may no longer have the format of a so-called Swiss-type claim as instituted by decision G 5/83 (OJ 1985, 64). Following T 609/02, the board in T 801/06 recalled that a claimed therapeutic effect may be proven by any kind of data as long as they clearly and unambiguously reflect the therapeutic effect. Thus, the fact per se that the experiments in the patent were not carried out with a "real" metastasis was not sufficient to deny sufficiency of disclosure.

If a therapeutic application is to be accepted as sufficiently disclosed, the application or the patent, respectively, and/or the common general knowledge has to provide some information rendering it technically **plausible** for the skilled person that the claimed compounds can be applied for the claimed therapeutic use (T 1599/06 citing T 609/02).

Post-published evidence may be taken into account, but only to back-up the findings in the application in relation to the use of the compound(s) as a pharmaceutical (T 609/02, T 950/13).

These principles were applied to decisions concerning second medical use claims (see, for example, T 699/06 and T 1396/06) and in T 604/04, to claims directed to first medical use claims and to pharmaceutical compositions.

In T.1777/12 claims 1 and 10 were medical use claims and related to the use of a PYY agonist in the manufacture of a medicament for treating a metabolic disorder in an obese or overweight subject. Clinical trials are not required to establish suitability. It may suffice that in vitro or in vivo data directly and unambiguously reflect the therapeutic effect on which the claimed therapeutic application relies or, alternatively, that there is an established relationship between the physiological activities of the compound under consideration and the disease in question. The board concluded that the disclosure in the patent demonstrated the suitability of PYY for achieving a beneficial effect in all of the claimed therapeutic applications by reducing weight or weight gain.

In T.1045/13, concerning a second medical use claim worded in accordance with Art. 54(5) EPC, the board stated that the application as filed did not provide any indication of the principle underlying the relationship between the activity of the pharmaceutically active agent, i.e. the NGF, and the therapeutic effect, i.e. the alleviation of the symptoms of the psychological conditions claimed. The description did not provide any information on the mechanism of action of NGF. No background references were cited that linked NGF to the therapeutic effects to be obtained, and no in vitro assays were provided to illustrate any such effect. In the complete absence of such information, the experimental evidence on file was of decisive importance. But the evidence in the application as filed did not constitute a sufficient disclosure. Indeed the experimental evidence consisted of eleven examples relating to various conditions but did not cover all the conditions defined in claim 1; each example related to a single patient only, contrary to the common practice in order to allow statistical analysis of the results. Also, in the absence of a control group, placebo effects could not be excluded. The post-published evidence might be taken into account, but only to back up the findings in the patent application. Post-published evidence could not establish sufficiency of disclosure on its own. They did not need therefore to be discussed.

For sufficiency of disclosure, it is not relevant what the respondent (patent proprietor) was aware of, but decided not to disclose. Rather the application, taking into account common general knowledge, must contain sufficient evidence or at least a technically plausible concept that allowed the skilled person to conclude that the claimed compound is suitable for the claimed therapeutic use. The board agreed with the statements made in T.433/05 and T.801/06 referred to by the respondent, but in case T.1868/16, no data or plausible technical concept was present in the patent. Reference was also made to T.609/02 and T.801/10, but in the present case no effect was observed (T.1868/16 – suitability of everolimus in the treatment of PNETs).

A post-published document reporting that no proven effective vaccine against HSV was available did not prove the non-workability of the invented vaccine, since there might have been other reasons, e.g. regulatory reasons, for not producing vaccines according to the invention. Furthermore, for compliance with the requirements of Art. 83 EPC 1973, it was not necessary to undertake and disclose clinical trials (T.1023/02).

In T.2571/12 (treatment of schizophrenia with glutathione), the board stated that there was no evidence at all either in the patent or in the available prior art for a therapeutic effect of glutathione precursors for any of the claimed disorders, and hence the post-published

document, allegedly supporting such an effect *inter alia* for bipolar disorders, likewise could not be taken into account for the assessment of sufficiency of disclosure.

For the acceptance of sufficient disclosure of a therapeutic application, it is not always necessary for results of clinical trials to be provided at the relevant date, but the patent/patent application must provide some information showing that the claimed compound has a direct effect on a metabolic mechanism specifically involved in the disease. Once this evidence is available from the patent/patent application, post-published evidence may be taken into account to support the disclosure in the patent application (T 433/05).

In decisions such as T 2181/08, T 338/10, T 1685/10, T 943/13 and T 2059/13, the boards have cited the approach taken in T 433/05 and T 609/02 and applied it to the specific cases before them. In T 895/13 of 21 May 2015 the board stated that, pursuant to decision T 609/02, attaining the claimed therapeutic effect was a functional technical feature of a claim drawn up in the Swiss-type form. In its view, the same principle applied to purpose-related product claims drawn up in accordance with Art. 54(5) EPC. Accordingly, the therapeutic effect provided by the claimed subject-matter was to be examined in the context of the assessment of sufficiency of disclosure (Art. 83 EPC) (see G 1/03, point 2.5.2 of the Reasons) and not, as in the decision under appeal, in the context of the assessment of inventive step.

In T 1616/09 the board pointed out that, for the purposes of Art. 83 EPC, the level of disclosure in the application which is required for claims directed to pharmaceutical compositions or kits is not the same as that which is required for medical-use claims. For claims directed to pharmaceutical compositions or kits it is in principle sufficient that the application provides information which allows the skilled person to produce the composition or kit, and that there are no substantiated doubts that it could indeed be used in therapy. For second-medical-use claims, on the other hand, it is required not only that the composition itself is disclosed in an enabling way but also that its suitability for the claimed treatment is **plausibly** disclosed in the application. In the case of a claim directed to a pharmaceutical composition comprising two classes of compounds which had both already been used in therapy in the prior art, there was a priori no reason to doubt that such a pharmaceutical composition could be produced; no specific functional effect had to be demonstrated. In the case of second-medical-use claims, if the claimed therapeutic effect was already known to the skilled person at the priority date, it was not necessary to demonstrate it in the application. According to T 1616/09, T 609/02 does not apply to compositions but only to second-medical-use-claims (see also T 1592/12, which also states that it is not sufficient to show that the skilled person can apply the claimed dosage regime, points 16-17 of the Reasons).

In T 1823/11 claim 1 related to phaseolamin for use as an anticaries agent. In its decision to refuse the application for non-compliance with the requirements of Art. 83 EPC, the examining division had pointed out two deficiencies, namely the absence of indications as to the preparation of phaseolamin and the absence of any information as to the pH conditions. The board did not share this conclusion. It decided to remit the case and addressed some observations to the first-instance department. It observed that claim 1

was drafted as a purpose-limited product claim in accordance with Art. 54(5) EPC. The technical effect of phaseolamin of being useful as an anticaries agent was expressed in the claim. When the technical effect was expressed in the claim, the issue as to whether this effect was indeed achieved over the whole scope of the claim was a question of sufficiency of disclosure (G 1/03, OJ 2004, 413, point 2.5.2 of the Reasons). This general approach applied in particular to claims including a **therapeutic effect** as a feature of the claim, such as purpose-limited product claims in accordance with Art. 54(4) and 54(5) EPC or claims drafted in accordance with the "Swiss-type" format (T 906/10, T 1616/09, T 1869/11). Thus, in order to establish whether the requirement of sufficiency of disclosure was met it had to be assessed at first instance whether the application disclosed the potential suitability of phaseolamin to act as an anticaries agent or whether this information could be derived from the prior art.

T 338/10 concerned a claim for a second therapeutic use in which the active ingredient was a "first allergen" and the therapeutic use the treatment or prevention of an allergy caused by a different, second allergen. The board found that there was no experimental data in the patent proving that a first allergen could be used to treat an allergy caused by a different allergen.

7.3. Level of disclosure required for antibodies

In T 431/96 the skilled person seeking to reproduce the invention would have had to produce monoclonal antibodies by routine methods and test them singly in an assay. Although this might possibly involve some tedious and time-consuming work, it was nothing out of the ordinary since the techniques for the production and selection of hybridomas were common routine techniques at the priority date of the patent in suit.

The board found that the essential issue to be considered in T 601/05 of 2 December 2009 was whether or not the patent enabled the production of human monoclonal antibodies binding with high affinity to soluble TNF and, consequently, whether or not the skilled person could practise the invention over the whole scope of the claim (following T 792/00). On the evidence before the board it did not.

In T 1466/05 the question arose whether the availability of a hybridoma producing one specific antibody together with a general description of the epitope recognised by this antibody put the skilled person in the position to obtain further antibodies with the same specificity. The board observed that similar questions had arisen in various cases decided by the boards of appeal, and different boards had given different answers depending on the circumstances of each case (T 510/94, T 513/94, T 349/91, T 716/01).

In T 1466/05 the claim was not restricted to monoclonal antibodies defined by reference to the deposited hybridoma. As the application did not disclose any specific antigen for preparing further antibodies as claimed, the board considered that a skilled person seeking to prepare such antibodies would have had to embark on **a research programme** without any teaching in the application as how to achieve the desired specificity which amounted to an undue burden (cited in this respect by T 760/12).

Concerning the second medical use claims (claim 6 in the "Swiss-type" format, claim 7 in the purpose-restricted product claim format) in T. 760/12, the technical effect, which was the therapeutic effect, was expressed in the claim. When the technical effect is expressed in the claim, the issue of whether this effect is indeed achieved over the whole scope of the claim is a question of sufficiency of disclosure (G. 1/03, OJ 2004, 413, point 2.5.2 of the Reasons). Hence, under Art. 83 EPC, unless this is already known to the skilled person at the priority date, the application must disclose the suitability of the product to be manufactured for the claimed therapeutic application (T. 609/02, point 9 of the Reasons). The board concluded that it was not sufficiently disclosed in the patent that a single monoclonal antibody as defined in the claim potentially exerted the therapeutic effect as claimed.

The claim at issue in T. 405/06 was directed to immunoglobulins with certain stated features. The question to be answered was whether a skilled person would have found at the filing date in the application as filed a sufficiently clear and complete disclosure of the precise structure of such an immunoglobulin in order to be in a position to prepare it over the broad range of the claim. Although the claim was not limited to immunoglobulins obtained from camelids, the experimental part of the description as a whole and the corresponding figures dealt exclusively with camel immunoglobulins and the general part of the description did not contain a complete disclosure of any non-camelid immunoglobulin either. The requirements of Art. 83 EPC 1973 were thus not satisfied, as the skilled person would be left with the task and burden of finding out how the teaching relating to camelid immunoglobulins could be extended to products of different origins (e.g. human immunoglobulins) falling within the broad area of the claim.

The application the subject of T. 433/07 concerned broadly reactive opsonic antibodies that react with common staphylococcal antigens. The board held that the invention was insufficiently disclosed; the application did not disclose either any serotype cross reactive monoclonal antibody or the isolation of an antigen associated with the serotype cross protective response required by the claim. A European patent application containing a claim referring to a method of production had to provide the skilled person with the means to produce the desired product. If this was not the case, this shortcoming could not be overcome by telling him exactly how the desired product had to look and which screening criteria had to be applied to find it.

In T. 617/07 the claim at issue concerned monoclonal antibodies and synthetic and biotechnological derivatives thereof defined by structural and functional features. The board found that, given his common general knowledge, the skilled person would be able, in a possibly time-consuming but straightforward manner, to provide antibody variants having the functional requirements indicated in the claim. There was no doubt that the structural definition in the claim included antibodies that did not have the desired function but, when attempting to rework the invention the skilled person would on the basis of his knowledge be able to avoid non-functional variants. Therefore, because the skilled person knew how to achieve antibodies with the desired function on the basis of a particular known antibody, he was not in the situation of having to sort out non-functional variants in a burdensome manner.

In T. 386/08 the patent concerned humanised antibodies with framework sequences. It disclosed not only one, but many examples. The board pointed out that the concept of sufficiency of disclosure over the whole scope of the claim did not mean that, for a disclosure to be considered as sufficient, it had to be demonstrated that each and every conceivable embodiment of a claim could be obtained; see G. 1/03 (OJ 2004, 413). There may be situations where the specification contains sufficient information on the relevant criteria for finding appropriate alternatives ("variants") over the claimed range with reasonable effort. Under these circumstances the non-availability of certain variants encompassed by the claim at the priority date is considered immaterial for the sufficiency of disclosure. For an example where this was not so, see T. 601/05. The current situation however was different in that the patent described quite a number of appropriate alternatives and in that the allegedly non-obtainable variants were "hypothetical" variants. The requirements of Art. 83 EPC were fulfilled.

7.4. Factors contributing to a finding of undue burden

In T. 187/93 there were experimental uncertainties in the patent application. The board found that the skilled person, when trying to obtain the same technical effect with a different glycoprotein would have experienced lack of predictability, which amounted to an undue burden.

In T. 2006/08, although no experimental details were provided for factor IX in the patent-in-suit, the board considered that no undue experimentation would be required to carry out the method steps. It was plausible that the claimed process achieved an improvement of the in vivo function of factor IX. The requirements of Art. 83 EPC were fulfilled.

Similarly, in T. 727/95, the board found that the invention relied too much on chance. The claimed subject-matter included a "microorganism designated Acetobacter and having the ability of microorganisms [...]". The board observed that by including the phrase "having the ability of", the claim covered not only Acetobacter microorganisms derived from the deposited strains, but also Acetobacter microorganisms which had the stated characteristics in common with the deposited strains. In the board's judgment, finding other stable, cellulose high-producing Acetobacter strains in nature was a chance event, and relying on chance for reproducibility amounted to an undue burden in the absence of evidence that such chance events occurred and could be identified frequently enough to guarantee success. The board concluded that the claim was not repeatable without undue burden over the entire breadth of the claim.

The claimed subject-matter in T. 639/95 concerned a method for producing PHB biopolymers in a host transformed with genes encoding the enzymes β -ketothiolase, acetoacetyl-CoA reductase and polyhydroxy butyrate (PHB) synthetase. The board found that the experimental plan for identifying and isolating the PHB gene was very general. Some references were missing and/or incomplete. There were no results and no details which could facilitate the repetition of the work. The board thus held that the total amount of experimental effort necessary amounted to an undue burden for the skilled person.

However, in **T. 412/93**, where errors and omissions prejudiced the reproducibility of one of the examples in toto and of another example in part, the reproducibility of the invention was not affected, as the examples were alternatives to previous ones.

In **T. 612/92**, further scientific research would have been necessary in order to carry out the invention in some of the areas claimed. The board held the requirements of **Art. 83 EPC 1973** were not fulfilled because there were serious doubts as to whether such a method could be performed over the whole range that was claimed (see **T. 694/92**, OJ 1997, 408).

However, in **T. 223/92** the disclosure enabled those skilled in the art to reproduce the invention, possibly in a time-consuming and cumbersome way, but, in the given circumstances, without undue burden of experimentation and without needing inventive skill (see also **T. 412/93**).

T. 1456/06 concerned the level of disclosure required for enablement of a claim directed to peptide vaccines. It was apparent from the prior art that the development of peptide-based vaccines to treat cancer – the sole specific type of vaccine mentioned in the application as filed – was not only extremely laborious, but also fraught with uncertainties. The application as filed did not disclose any telomerase peptide which might – plausibly – be regarded as a suitable candidate for a vaccine, nor did it contain either technical information as to how to identify possible candidate peptides, or instructions on how to proceed in case of failure. The board concluded that identifying immunogenic fragments of the telomerase protein suitable for the manufacture of a vaccine by a trial and error procedure constituted an undue burden to a person skilled in the art.

The application in **T. 1364/08** concerned viruses for the treatment of cellular proliferative disorders. It provided no experimental data proving that the claimed adenovirus was able to replicate in cells having an activated Ras-pathway but not in normal cells. No data was present demonstrating that such a virus could be useful for the treatment of Ras-mediated cell proliferative disorders. However, based on what was described in the application as filed and taking into account what was known in the prior art, it was credible that the modified adenovirus specified in the claim would have been effective for the treatment of Ras-mediated cell proliferative disorder. Post-published evidence could therefore be taken into account to back up this evidence (following **T. 609/02**).

In **T. 1846/10** the invention under consideration related to the preparation of a live vaccine against *L. intracellularis* which relied on the use of attenuated *L. intracellularis* bacteria. *L. intracellularis* is the causative agent of proliferative enteropathy in pigs, also known as porcine proliferative enteropathy (PPE). To be suitable as a live vaccine strain, the attenuated bacteria must fulfil the following three criteria: (i) apathogenicity, which means that they do not cause the disease; (ii) be suitable and retain immunogenicity, which means that they induce protective immunity in the animal host, and (iii) genetic stability, which means that they do not revert to being pathogenic or conversely become too attenuated. This was undisputed among the parties.

The skilled person, wanting to carry out the claimed invention, could not rely on his common general knowledge or the prior art to obtain suitable attenuated *L. intracellularis* bacteria. The patent had to provide the necessary guidance for the successful implementation of the claimed invention. The board concluded that the guidance provided by the patent did **not** allow the skilled person to obtain an attenuated *L. intracellularis* strain **without undue burden** or inventive step.

The skilled person was taught by the patent that he had to test the passaged strain, but only to confirm attenuation. The *L. intracellularis* strain suitable to carry out the invention not only had to be less virulent than the corresponding wild type strain, but also had to fulfil the additional two criteria of appropriate immunogenicity and genetic stability. Relying on the guidance provided by the patent and not knowing why the strain used in example 5 did not protect the vaccinated animals he would have had no reason to assume that the number of passages had to be increased. The person skilled in the art would not be inclined to consider the intervals disclosed in the description of the patent as mere lower limits but would have understood these indications as concrete ranges. The board concluded that example 5 of the patent represented evidence that the skilled person, by following the guidance of the patent, would fail to obtain an attenuated strain of *L. intracellularis* suitable for the preparation of a live vaccine.

In **T 1376/11** the board concluded that the only way disclosed in the application to arrive at the paprika plants of the invention started from parental *Capsicum annuum* NM varieties, such as *Capsicum annuum* NM 1441. The public availability of these parental plants at the priority date of the application was therefore a mandatory requirement for the skilled person to reproduce the invention. In the absence of evidence that *Capsicum annuum* NM 1441 was publicly available, the board concluded that the application did not disclose the subject-matter of claim 1 in a manner sufficiently clear and complete for it to be carried out by the skilled person.

7.5. Requirements relating to nucleotide and amino acid sequences

Under **R. 30(3) EPC**, where the applicant has not filed the necessary sequence listing prescribed in **R. 30(1) EPC**, the EPO shall invite him to furnish it on payment of a fee. In **J 7/11**, the Legal Board held that such invitations cannot be given orally only – a telephone call was, given the short time available, useful, but had to be followed by a written invitation enumerating all objections raised. Failure to do so amounted to a substantial procedural violation.

In **J 8/11** the crucial issue on appeal was the interpretation of the term "disclosed" in **R. 30(1) EPC**, namely the question whether a patent application which related to the use of polypeptides well known in the prior art and which identified these polypeptides by their common names and by database accession numbers concerning specific representative sequences had to be regarded as "disclosing" amino acid sequences. The board concluded that prior art sequences do not require the filing of a sequence listing and that the Receiving Section had been wrong to apply **R. 30 EPC**. With reference to **J 7/11** the board pointed out that the Receiving Section is restricted to a merely formal examination of the sequence listing requirements.

7.6. Deposit of living material

If an invention involves the use of or concerns biological material which is not available to the public and which cannot be described in the European patent application in such a manner as to enable the invention to be carried out by a person skilled in the art, the invention shall only be regarded as being disclosed as prescribed in Art. 83 EPC if a sample of the biological material has been deposited with a recognised depository institution not later than the date of filing of the application (R. 31(1)(a) EPC) and if the application fulfils the other requirements set out in R. 31 EPC (see also G. 2/93, OJ 1995, 275).

The disclosure of a microorganism need not depend on a deposit according to R. 28 EPC 1973 where the microorganism is sufficiently disclosed by other means (T. 2068/11; cited recently by T. 1338/12 very detailed on this issue).

As part of the 2000 EPC revision, for greater clarity and consistency, R. 27a, 28 and 28a EPC 1973 were restructured, trimmed and incorporated (as R. 30 to 34 EPC) into the chapter on biotechnological inventions (see OJ SE 1/2003, 164, OJ SE 5/2007, 44 and 54). New R. 31 EPC deals with the deposit of biological material, new R. 32 EPC with the expert solution and new R. 33 EPC with the availability of the deposited biological material as from the date of application of the European patent application (OJ SE 5/2007, 46; see also OJ 2017, A55 (CA/D 3/17), OJ 2017, A60 and A61 (Notice)).

7.6.1 Substantive law questions

In decision T. 418/89 (OJ 1993, 20) the characteristics of the monoclonal antibodies produced by the deposited strain were different from those mentioned in the claims. It was not possible to produce monoclonal antibodies from the deposited hybridoma using techniques recommended by the depository institution. The requirements of Art. 83 EPC 1973 were thus not met. A disclosure could not be regarded as sufficient if it was only possible to reproduce the invention after repeated requests to the depository institution and by applying techniques considerably more sophisticated than those the latter recommended. Nor could the scope of the patent be restricted to what had been deposited, as the characteristics of the deposit differed from the written disclosure in the patent. Thus a mere deposit of a hybridoma without any corresponding written description did not provide a sufficient disclosure. Similar conclusions were reached in decisions T. 495/89 and T. 498/94.

R. 31(1) EPC cannot be interpreted such that there is an obligation to deposit material to facilitate the reproduction if the invention can be repeated on the basis of the written description, even if this should be a much more cumbersome way than by merely growing the deposited micro-organism (see e.g. T. 223/92).

Similarly, in T. 412/93 the board stated that the need for a deposit cannot be introduced by reference to the concept of undue burden. This concept relates more to cases where the route that the reader is to follow is so poorly marked that success is not certain such as in T. 418/89 (see above). If the road is certain but long and laborious, the patentee is under

no obligation to assist the disclosure by making actual physical samples available. The board felt that to come to the opposite conclusion would be effectively to introduce a requirement to make the best mode immediately accessible to the public, and such a requirement is not part of the European patent system (see also T 431/96).

With respect to the question whether the reproducibility of specific micro-organisms (e.g. plasmids or viral strains) was assured by the written description in the absence of a deposit, the board, after careful examination of the written disclosure, held in some cases that the information provided in the application was sufficient to lead the skilled person reliably to the same micro-organisms (T 283/86, T 181/87); in other cases it was not (T 815/90 of 20 October 1997, T 816/90; see T 2542/12, commercial fish farms in Norway – not a reliable source; also T 1338/12, scientific publications).

7.6.2 Procedural law questions

a) Conversion into deposit under the Budapest Treaty

T 39/88 (OJ 1989, 499) affirmed the principle that one important purpose of R. 28 EPC 1973 (R. 31 EPC) is to make the availability of the deposited organisms independent of any consent by the depositor. The board observed that the proper way of bringing a deposit originally filed for another purpose (here a US application) into line with the requirements of the EPC system was to formally convert the deposit into a deposit under R. 28 EPC 1973 (in the case of a deposit made on the basis of a special agreement between the EPO and the depositary institution) or into a deposit under the Budapest Treaty (which automatically covered R. 28 EPC 1973), as the case might be (see also T 239/87, T 90/88, T 106/88).

b) Late submission of deposit number

According to R. 28(1)(c) EPC 1973, the application had to state the depositary institution and the file number of the deposited biological material. In G 2/93 (OJ 1995, 275) the Enlarged Board of Appeal held that the provisions of R. 28 EPC 1973 were subordinate to the requirements of Art. 83 EPC 1973. The indication of the file number (accession number) of a culture deposit in a patent application was substantive because, under the EPC, it was instrumental in enabling a person skilled in the art to carry out the invention. The Enlarged Board therefore held that, contrary to the ruling in J 8/87 (OJ 1989, 9), the information concerning the file number could not be submitted after expiry of the time limit set out in R. 28(2)(a) EPC 1973 (i.e. sixteen months after the date of filing of the application or, if priority is claimed, after the priority date).

As for the term "publication" within the meaning of R. 28(2)(a), second part of sentence, EPC 1973 in the context of a European application filed as an international one, see T 328/04.

See T 227/97 (OJ 1999, 495) for the board's decision that reestablishment of rights may be available for the time limit set by R. 28(2)(a) EPC 1973 and R. 13bis.4 PCT.

8. The relationship between Article 83 and Article 84 EPC

8.1. Article 83 EPC and support from the description

The patent claims must clearly define the subject-matter for which protection is sought under Art. 84 EPC. In T 94/82 (OJ 1984, 75) it was held that this requirement was fulfilled in a claim to a product when the characteristics of the product were specified by parameters relating to the physical structure of the product, provided that those parameters could be clearly and reliably determined by objective procedures which were usual in the art. In such a product claim, it sufficed to state the physical properties of the product in terms of parameters, since it was not mandatory to give instructions in the claim itself as to how the product was to be obtained. The description, however, had to fulfil the requirements of Art. 83 EPC 1973 and thus enable the person skilled in the art to obtain the claimed product described in it (see also T 487/89, T 297/90, T 541/97). Nor should this be understood as also referring to those variants falling under the literal wording of the claim but which the skilled person would immediately exclude as being clearly outside the scope of practical application of the claimed subject matter, for example, claims including an open ended range for a parameter where it was clear for a skilled person that the open-ended range was limited in practice. Values of the parameter not obtainable in practice would not be regarded by the skilled person as being covered by the claims and thus could not justify an objection of insufficiency of disclosure (T 1018/05).

It is of relevance whether a problem falls within Art. 83 or Art. 84 EPC when taking into consideration that examination in respect of the requirements of Art. 83 EPC is still permitted during opposition proceedings, whereas in respect of Art. 84 EPC it is limited during opposition proceedings to those cases where there has been an amendment (see T 127/85, OJ 1989, 271; see also T 301/87, OJ 1990, 335; T 1055/98; T 5/99). With regard to the examination in respect of Art. 84 EPC during opposition proceedings see also chapter II.A.1.4.; and recent decision G 3/14, confirming the jurisprudence exemplified by T 301/87).

In T 292/85 (OJ 1989, 275) the stated grounds for the refusal were that the disclosure was not sufficient under Art. 83 EPC 1973 and there was consequently a lack of proper support under Art. 84 EPC 1973. The board pointed out that in appropriate cases it is only possible to define the invention (the matter for which protection was sought, Art. 84 EPC 1973), in a way which gives fair protection having regard to the nature of the invention which had been described by using functional terminology in the claims. The need for fair protection governs both the considerations concerning the scope of claims and the requirements for sufficient disclosure. The board found that an invention is sufficiently disclosed if **at least one way** is clearly indicated enabling the skilled person to carry out the invention.

In T 409/91 (OJ 1994, 653; ex parte) and T 435/91 (OJ 1995, 188; inter partes) it was pointed out that the protection conferred by a patent should correspond to the technical contribution to the art made by the disclosure of the invention described therein, which excludes the patent monopoly being extended to subject-matter which, after reading the patent specification, would still not be at the disposal of the skilled person. The available information must enable the skilled person to achieve the envisaged result within the whole

ambit of the claim containing the respective functional definition without undue difficulty, and the description with or without the relevant common general knowledge must provide a fully self-sufficient technical concept as to how this result is to be achieved. T. 409/91 was followed up in T. 713/98, where the board stated that the requirement of understanding a claim characterised by a functional feature defining a result to be achieved was one of clarity and the requirement of implementing it was one of support, both within the meaning of Art. 84 EPC 1973. Implementation, viewed in relation to the disclosure as a whole, was highly relevant to the question of sufficiency under Art. 83 EPC 1973. See also T. 1225/07.

In the inter partes case T. 435/91 (OJ 1995, 188), one of the essential technical features was defined only by its function. It was not possible to identify, on the basis of the information contained in the patent specification or of common general knowledge, compounds other than those specifically mentioned as bringing about the desired effect. The board held that the compositions must all be available to the skilled person if the definition was to meet the requirements of Art. 83 EPC 1973.

However, as long as there are no concrete grounds for believing that the invention cannot be carried out within the whole range claimed, there is no reason for not allowing more broadly based claims in an application (T. 242/92, T. 484/92). In opposition proceedings the opponent bears the burden of proving that the invention cannot be carried out within the whole range claimed (T. 418/91, T. 456/91, T. 548/91). See in this chapter II.C.9.

In T. 1404/05 the board found that where a claim is vaguely formulated and leaves several constructions open as possibilities, and on one of these constructions part of the subject-matter claimed is not sufficiently described to be carried out, the claim is open to objection under Art. 100(b) EPC. To avoid this objection the claim needs to be explicitly restricted to a construction which is also possible on the vague formulation of the claim, but which construction is not open to an Art. 100(b) EPC objection. The mere fact that the description makes clear that this latter construction is the one intended does not mean that the claim can be treated as being confined to this latter construction. Art. 69 EPC and its protocol were intended to assist a patent proprietor in contending for a broader interpretation of a claim than perhaps its wording warranted, not for cutting down the scope of a claim.

In T. 553/11 the board pointed out that if the proprietor wishes to argue for a narrow scope of a claim, this should be on the basis of the ordinary wording of the claim, and not on the basis of something appearing only in the description (following T. 1404/05). The board also referred to T. 681/01, where it was emphasised that the normal rule of claim construction is that the terms used in a claim should be given their ordinary meaning in the context of the claim in which they appear. The description may not be used to rewrite the claim and **redefine** the technical features required by the claim in a way not warranted by the wording of the claim itself. In particular the description cannot be relied on to exclude subject-matter from the claim which the ordinary meaning of the terms used would include as part of what is claimed. See also chapter II.A.6.3. "Using description and drawings to interpret the claims".

In T. 1188/15 the skilled person had no requirement to interpret the claim in a more limited sense in the light of a specific embodiment of the description to which the claim was not

limited, the claim itself imparting a clear and credible technical teaching to the skilled reader.

In T 1691/11 claim 1 of all requests included the features of "at least two independent programmable motors" and "at least one of the transferring devices being coupled to each of the programmable motors". These features were clear and unambiguous. The clear linguistic structure of the claim did not allow for any different interpretation. Additionally, a discrepancy between the claims and the description was not a valid reason to ignore the clear linguistic structure of a claim and thus to interpret the claim differently (see also T 431/03). When the wording of a claim is perfectly clear it needs to be considered under Art. 83 EPC, rather than undertaking another speculative interpretation of the claim.

T 2182/11 concerned the second aspect of the appellant's (opponent's) objection relating to the alleged impossibility of carrying out the claimed invention over the whole range claimed because of the vague claim language. The board had in particular stated in its preliminary opinion that the expression "register with" was very broad. The board stated that breadth of an expression was really a matter concerning the clarity requirement of Art. 84 EPC rather than a ground for opposition. In as far as the objection was to be considered under Art. 83 EPC, the mere fact that a **term is broad** does not prevent a skilled person from carrying out the invention.

8.2. Article 83 EPC and clarity of claims

There is now a clearly predominant opinion among the boards that the definition of the "forbidden area" of a claim should not be considered as a matter related to Art. 83 and 100(b) EPC (T 646/13). Decision T 626/14 does not call this into question, according to the board in T 250/15. See also in this chapter II.C.6.6.4 "Forbidden area of the claims".

When undefined parameters are used in the claims and no details of the measuring methods are supplied, the question arises whether there is a problem with respect to Art. 83 or Art. 84 EPC. The answer to this question is important because in opposition proceedings the patent can be examined for its compliance with Art. 83 EPC without any restriction. Compliance with Art. 84 EPC is however examined only in cases where there has been an amendment. In its decision G 3/14 (OJ 2015, A102) the Enlarged Board reiterated the principles governing the extent to which patents amended in opposition proceedings can be examined for compliance with Art. 84 EPC. A more detailed account of its decision can be found in chapter II.A.1.4.

In some decisions (for example, T 123/85, T 124/85, T 172/87, T 358/88, T 449/90, T 148/91, T 267/91, T 697/91, T 225/93, T 378/97, T 387/01, T 252/02, T 611/02, T 464/05, see recently T 626/14) the absence of information in the application on methods for measuring undetermined parameters in the application was considered a problem with respect to Art. 83 EPC. These were all inter partes proceedings. This problem has also been addressed with reference to Art. 83 EPC in ex parte proceedings, (see T 122/89 of 5 February 1991 and T 503/92). Other decisions have considered this a problem with respect to Art. 84 EPC, for example, in T 860/93 (OJ 1995, 47), also ex parte proceedings, it was decided that the absence of methods for measuring a relative quality in the claim

was a problem with respect to the clarity of the claim. See also [T. 230/87](#), [T. 176/91](#) of 10 December 1992, [T. 917/92](#), [T. 299/97](#), [T. 439/98](#), [T. 413/99](#), [T. 930/99](#), [T. 960/98](#), [T. 619/00](#), [T. 943/00](#), [T. 344/01](#), [T. 563/02](#), [T. 1033/02](#), [T. 208/03](#), [T. 882/03](#), [T. 452/04](#), [T. 1316/04](#), [T. 466/05](#), [T. 1586/05](#), [T. 859/06](#). Some of these decisions are discussed further below.

According to [T. 593/09](#) (see Headnote about ill-defined ("unclear", "**ambiguous**") **parameter**) the requirement of sufficient or "enabling" disclosure in the sense of [Art. 83 EPC](#) is different from and independent from the clarity requirement pursuant to [Art. 84 EPC](#). The board saw this distinction as underlying the decision in [T. 1062/98](#). The board in [T. 593/09](#) saw a **distinction** between the meaning of "clear" in [Art. 83 EPC](#), which concerns the disclosure (the "technical teaching") of the application or the patent on the one hand, and in [Art. 84 EPC](#), where that expression relates to the claims, which "shall define the matter for which protection is sought" on the other hand. In short, there is a distinction between clarity of what has been disclosed and clarity of what is claimed. The board found that this distinction was not always properly made, in particular in respect of so called "ambiguous parameters", i.e. parameters present in the description and/or claims, whose exact definition and/or applicable measuring method remained doubtful. For example, numerous decisions of the boards of appeal have as a relevant criterion for the sufficiency of a disclosure containing an ill-defined parameter, whether the skilled person knows if he is working within or outside of the scope of the claim (see [T. 256/87](#), [T. 387/01](#), [T. 252/02](#) and [T. 18/08](#)). It was however, not always apparent from the reasoning of these decisions whether or not this criterion was meant to be the sole or the decisive one.

In [T. 943/00](#), the board **disagreed with** [T. 256/87](#), finding that the concept of "forbidden area" was associated with the scope of the claims, i.e. [Art. 84 EPC 1973](#), rather than with sufficiency of disclosure. The board in [T. 466/05](#) agreed, also stating that a distinction should be made between the requirements of [Art. 84 EPC 1973](#) and those of [Art. 83 EPC 1973](#), and that with respect to sufficiency, the relevant question was whether the patent in suit provided sufficient information which enabled the skilled person when taking into account common general knowledge to reproduce the invention (see also [T. 472/14](#)). Numerous decisions (e.g. [T. 960/98](#), [T. 619/00](#), [T. 396/02](#), [T. 1033/02](#), [T. 452/04](#), [T. 466/05](#), [T. 1586/05](#), [T. 1015/06](#), [T. 1250/08](#), [T. 593/09](#), [T. 1507/10](#), [T. 2331/11](#), [T. 2290/12](#), [T. 1811/13](#), [T. 647/15](#), [T. 548/13](#)), have also interpreted the statement, "knowing when working within the forbidden area of the claims" formulated in [T. 256/87](#) as addressing the question of the limits of protection conferred by the claims, and thus relating to a requirement of [Art. 84 EPC](#) rather than of [Art. 83 EPC](#). See also in this chapter [II.C.6.6.4](#) "Forbidden area of the claims".

The board in [T. 2290/12](#), having summarised the case law on sufficient disclosure versus clarity, concluded that a broad consensus, or at least a prevailing view, had now been reached that the skilled person's ability to establish whether or not subject-matter fell within the claimed scope was a requirement for clarity and not for sufficient disclosure (see also similar decisions [T. 1811/13](#) and [T. 647/15](#)). All the respondent's objections under [Art. 100\(b\) EPC 1973](#) were concerned with the precise scope of protection conferred and so, in fact, clarity objections.

If it is argued that insufficiency arises from a lack of clarity, it is generally not sufficient to establish a lack of clarity of the claims in order to establish insufficiency of disclosure. Rather, it is necessary to show that the patent as a whole does not enable the skilled person, relying on the description and on his common general knowledge, to carry out the invention (T. 417/13 citing T. 1811/13 and T. 646/13).

For the board in T. 548/13 (security elements for security papers and value documents), the argument put forward by one party that the skilled person did not know what the back of a face should look like, or at least which of several options to select, confirmed its view that it was in fact dealing with a clarity objection. The case law on parameters, which included T. 815/07, did not apply because the feature in question did not involve any quantitative parameter for which the method of measurement might be insufficiently disclosed. It was instead a purely qualitative feature which could be determined without any measuring in the strict sense. The board could not see why the skilled person would be unable to equip a security element with security features showing different views of the same image, so it appeared that the opposition division had underestimated that person's abilities in this respect.

The board in T. 626/14 (thickness of fibrous composite – variability in measurement) considered it important to mention that T. 1811/13 and T. 647/15 – with essentially identical reasoning as regards Art. 83 EPC – sought to question the way in which Art. 83 EPC objections were reasoned in decisions such as T. 464/05. Yet, T. 1811/13 and T. 647/15 themselves concentrated only on an individual aspect in T. 464/05, namely "the area covered by the claim", without addressing the actual findings in that decision regarding Art. 83 EPC. T. 1811/13 and T. 647/15 did not cause the board in T. 626/14 to see anything which would undermine the reasoning in T. 464/05 concerning Art. 83 EPC. More recently in T. 250/15 the board held that T. 626/14 did not challenge the case law. T. 250/15 declined to make a referral to the Enlarged Board and considered that T. 626/14 and T. 464/05 concerned a particular constellation in a certain technical field.

In T. 646/13 the opponent's request for a referral hinged on an alleged contradiction between decisions T. 1811/13 and T. 464/05 on the issues of clarity of the claims and sufficiency of disclosure. The board concluded that these cases concurred in that an unclear definition of the boundaries of the claim pertained to Art. 84 EPC 1973. Application of the principles set out in decisions T. 464/05 and T. 1811/13 would not lead in the circumstances of T. 646/13 to different results. Finally and more importantly, as explained in decision T. 1811/13, decision T. 464/05 forms part of a line of jurisprudence established between 2004 and 2007, not generally followed since then. There is now a clearly predominant opinion among the boards that the definition of the "forbidden area" of a claim should not be considered as a matter related to Art. 83 and 100(b) EPC 1973, the alleged contradiction between decisions T. 464/05 and T. 1811/13 does not exist. Rather than being in conflict, these decisions illustrate a development of the case law on a particular question over an extended period of time.

The board in T. 608/07 found the issue before it with regard to sufficiency of disclosure was quite similar to the situation in T. 256/87, both concerning an insufficiency which arose through ambiguity. Although the board accepted that, depending upon the circumstances,

such an ambiguity might very well lead to an insufficiency objection, it should be borne in mind that this ambiguity also related to the scope of the claims, i.e. Art. 84 EPC 1973. Since, however, Art. 84 EPC 1973 was in itself not a ground of opposition, care had to be taken that an insufficiency objection arising out of an ambiguity was not merely a hidden objection under Art. 84 EPC 1973. The board was convinced that, for an insufficiency arising out of ambiguity, it was not enough to show that an ambiguity existed, e.g. at the edges of the claims. It would normally be necessary to show that the ambiguity deprived the person skilled in the art of the promise of the invention. It went without saying that this delicate balance between Art. 83 and 84 EPC 1973 had to be assessed on the merits of each individual case.

According to T. 593/09, the same rationale underlay both T. 608/07 and T. 815/07 (and also *Kirin-Amgen Inc v. Hoechst Marion Roussel Ltd* [2004] UKHL 46 of the United Kingdom House of Lords); namely, where a claim contains an ill-defined ("unclear", "ambiguous") parameter and where, as a consequence, the skilled person would not know whether he was working within or outside of the scope of the claim, this, by itself, is not a reason to deny sufficiency of disclosure as required by Art. 83 EPC. Nor is such a lack of clear definition necessarily a matter for objection under Art. 84 EPC only. What is decisive for establishing insufficiency within the meaning of Art. 83 EPC is whether the parameter, in the specific case, is so ill-defined that the skilled person is not able, on the basis of the disclosure as a whole and using his common general knowledge, to identify (without undue burden) the technical measures (e.g. selection of suitable compounds) necessary to solve the problem underlying the patent at issue.

The board in T. 1526/09 observed that it had been decided in T. 593/09 that a claim containing a vague or ambiguous parameter preventing the skilled person from knowing whether he was working within or outside the scope of the claim did not result in insufficient disclosure of the invention. The crucial question in deciding on sufficiency of disclosure was whether the parameter was so vaguely defined that the skilled person could not identify, in the patent as a whole, the measures required to solve the underlying problem. The parameter at issue had been essential to preparing the product. In T. 1526/09 the vague definition of chargeability affected the clarity of the claimed subject-matter but did not prevent the skilled person from preparing the claimed product.

The board, in T. 1305/15, was aware that according to case law, uncertainties in the measurement of a parameter did not necessarily amount to an insufficiency objection but might merely represent a hidden clarity objection under Art. 84 EPC (T. 608/07). This might be the case for example when no measurement method was specified in the patent and different known methods were available to the skilled person, possibly leading to different results (T. 1768/15). However, when the claimed parameter (the ZP in T. 1305/15) is crucial for solving the problem underlying the invention, the method used to measure it should produce consistent values, such that the skilled person will know when carrying out the invention whether what he produces will solve the problem or not (T. 815/07). Due to the severe lack of information concerning the ZP measurement method, the ZP on the inner membrane surface was so ill-defined that the skilled person, when trying to reproduce the hollow fiber membrane according to the contested patent, was at a loss whether or not the produced membrane was able to solve the problem underlying the invention. This posed

an undue burden on the skilled person, depriving him of the promise of the invention, and thus amounted to insufficiency of disclosure (citing T.593/09).

In T.378/11, the values disclosed in claim 1 referred to the average particle size. **No proof** had been submitted by the appellants/opponents that the lack of any indication as to the precise kind of average particle size hindered the skilled person from carrying out the invention at issue. The board found that the skilled person could select those kinds of mean values falling within the range 10-500 mym in order to prepare a composition according to the invention at issue. Whether or not the use of two kinds of mean values would lead to different results was a matter of clarity, rather than sufficiency of disclosure.

In T.1608/13 the board first stated that clarity (Art. 84 EPC) and sufficiency of disclosure (Art. 83 EPC) were two distinct requirements of the EPC, as reaffirmed in recent case law (T.2290/12, point 3.1 of the Reasons, citing T.608/07, point 2.5.2 of the Reasons). The board did not see how – and the respondent (opponent) did not explain why – a potential lack of clarity deriving from the claim definition of the sieving coefficient in the presence of whole blood could have a major impact on implementing a membrane which solved the specific technical problem that the invention aimed to solve. Hence, using the wording of T.608/07, with which the board concurred, such a potential lack of clarity would not deprive the skilled person of the promise of the invention, and would not result in insufficiency of disclosure. As far as lack of clarity is concerned, it is not a ground for opposition.

In T.2399/10, none of the cited documents, which had been published before the contested patent's priority date, used the expression "form factor". It appeared only in documents not forming part of the prior art under Art. 54(2) EPC. The patent thus did not disclose how to produce the alumina particles needed to obtain the claimed composition. This situation differed from cases where the features of the end product described in the patent were not clearly defined, which frequently resulted in a lack of clarity. Instead, it was a starting material which had not been here defined clearly enough. Since there was therefore inadequate information to select the **starting material**, the claimed composition could not be produced. This typically meant there was insufficient disclosure.

In T.287/10, the claimed invention concerned a composition for the surface treatment of paper, paperboard or the like. The respondent (opponent) alleged that the invention was insufficiently disclosed; the gist of its objection was that the end values of the size range of the synthetic silica nanoparticles of the claimed composition were ambiguous. The board disagreed. Exactly the same point of law had been considered and answered by the same board in the same composition in T.1414/08, with respect to another parameter common in the art, namely tensile strength. The reasoning and the conclusion drawn in decision T.1414/08 was, in the board's opinion, directly applicable to the case at issue, where the undefined parameter was the particle size. Hence, the ambiguity of **the end values** of the size range of the nanoparticles comprised in the claimed composition, just as in decision T.1414/08, was "not a matter to be addressed under Art. 83 EPC but a question of Art. 84 EPC". The board found the invention sufficiently disclosed.

In T.1055/92 (OJ 1995, 214) the examining division had rejected the patent application under Art. 84 EPC 1973 because in the claim it was not clear how certain values were to

be computed. The board held that the requirements of Art. 84 EPC 1973 should be clearly distinguished from the requirement under Art. 83 EPC 1973. Under Art. 83 EPC 1973, sufficient disclosure was required of a European patent application, i.e. of the application as a whole, comprising the claims, together with the description and the drawings, but not of an individual claim as such. A claim, on the other hand, had to comprise the essential features of the invention (T. 32/82, OJ 1984, 354); the essential features should comprise those features which distinguished the invention from the closest prior art. The primary function of a claim was to set out the scope of protection sought for an invention, which implies that it is not always necessary for a claim to identify technical features or steps in detail (see also T. 713/98).

According to T. 882/03, slightly varying results obtained when using different mathematical models for the calculation of the intrinsic viscosity did not prevent a person skilled in the art from carrying out the invention but were rather related to the question of whether the matter for which protection was sought was sufficiently defined in accordance with Art. 84 EPC 1973.

In T. 430/10 if the alleged lack-of-clarity was that a feature could be interpreted narrowly or broadly, the sufficiency requirements were met if the skilled person, applying the broad interpretation, was at least able to carry out all embodiments covered by the claims. In the case at issue, the requirements were fulfilled.

In T. 378/97, the board noted that sufficiency of disclosure addressed the practitioner who reduced the invention to practice, but did not stick to any precise theoretical values. Varying results did not, therefore, necessarily prevent a person skilled in the art from carrying out an invention (Art. 83 EPC 1973), but could be a matter of the definition of the invention under Art. 84 EPC 1973. See also T. 960/98, where the board stated that the relevant question with respect to sufficiency of disclosure was whether the patent in suit provided sufficient information to enable the skilled person, taking into account common general knowledge, to reproduce the invention, and T. 586/94, T. 245/98 and T. 859/06.

Following T. 378/97, the board in T. 439/98 found that the appellant's objections in regard to sufficiency of disclosure (the patent in suit allegedly failed to indicate a suitable method for measuring porosity), concerned the scope of the value of porosity indicated in the claim and therefore the clarity of the claim, rather than the possibility of reproducing the invention. In T. 619/00, the board agreed that the different methods for determining the value of the gel fraction did not per se represent an undue burden. In the absence of evidence that the different methods specified would lead to determination values deviating from each other by a substantial amount having technical significance (following T. 378/97), or by an amount that would place the skilled person in a situation where he was unable to carry out the invention (following T. 930/99), the mere fact that the patent specification was silent as to which method should be used did not prejudice sufficiency of disclosure. The question whether the methods defined lead to a unique value or to different values also concerned the clarity of the definition of the subject-matter of the claim under Art. 84 EPC 1973. In T. 930/99 only one measuring method was involved and the board had therefore considered T. 225/93 inapplicable, (according to T. 225/93, different measuring methods which did not always lead to the same result could amount to an

undue burden). The respondent's argument that there would be legal uncertainty, since third parties would not know whether they were working within or outside the range specified, was clearly an argument based on lack of clarity, which was not a ground of opposition and so could not be considered. See also [T. 396/02](#), [T. 347/10](#).

In [T. 805/93](#) the **viscosity** was the only characterizing feature of the claim at issue and its role in defining the matter for which protection was sought under [Art. 84 EPC](#), was clearly crucial. The lack of information on how the viscosity limit of the claim was to be determined meant the matter for which protection was sought could not be deemed defined, so that the claim did not comply with [Art. 84 EPC 1973](#). In addition, the disclosure of the application in suit did not enable him to carry out the claimed subject-matter on a general basis, so that the requirements of [Art. 83 EPC 1973](#) were also not met. Similarly, in [T. 431/07](#), since no method to measure the viscosity was mentioned in the description and due to the numerous methods and devices used to measure viscosity, the information available in the description as originally filed was not sufficient for the person skilled in the art to reproduce the claimed subject-matter under [Art. 83 EPC](#).

[T. 482/09](#) concerned the **viscosity** of a substance, a common parameter for which **standard measurement methods** were undisputedly **known**. The appellants' argument was instead that the parameter's value was uncertain because different measurement methods led to different results. According to the board, however, using an indefinite term in the claims was not a problem under [Art. 83 EPC](#), but rather under [Art. 84 EPC](#) (see also [T. 1886/06](#)), which requires, among other things, that the claims define the matter for which protection is sought. The appellants had cited one of the criteria for sufficient disclosure set out in [T. 256/87](#), namely that a skilled person reading the patent specification should be able to carry out the invention in all its essential aspects and know when he is working within the forbidden area of the claims, but the board held that this criterion could not be taken to mean that an invention was inevitably unworkable under [Art. 83 EPC](#) wherever the claims used a **term** which was **vague** for the purposes of [Art. 84 EPC](#) and could not be defined more precisely on the basis of the description or common general knowledge. In opposition and any ensuing appeal proceedings, the result of using such an indefinite term in a claim was instead that it could not be taken to determine the limits to the protection sought, so that novelty and inventive step had to be assessed in the light of the prior art identified on the basis of all its technically meaningful possible interpretations. If the term had no specific meaning whatsoever, it would even lose entirely its effect of delimiting the claimed subject-matter from the relevant prior art.

See also [T. 2001/12](#), which dealt with the distinction between the requirements of sufficiency of disclosure ([Art. 83 EPC](#)), clarity of the claims ([Art. 84 EPC](#)) and inventive step ([Art. 56 EPC](#)). [T. 862/11](#) dealt with this distinction in detail too.

9. Evidence

A successful objection of lack of sufficiency of disclosure presupposes that there are serious doubts, substantiated by verifiable facts (see e.g. decision [T. 19/90](#), OJ 1990, 476 and decision [T. 890/02](#), OJ 2005, 497). In order to establish insufficiency of disclosure in **inter partes proceedings**, the burden of proof is upon an opponent to establish, on the

balance of probabilities, that a skilled person reading the patent, using his common general knowledge, would be unable to carry out the invention (see decision T.182/89, OJ 1991, 391).

A mere statement that one of several examples in a patent has been repeated once "exactly as described" without obtaining exactly the results claimed in the patent is in principle inadequate to discharge that burden (see also T.406/91, T.418/91, T.548/91, T.588/93, T.465/97, T.998/97, T.499/00, T.751/00 and T.967/09). Where the parties make contradictory but unsubstantiated assertions concerning facts relevant for establishing patentability and the EPO is not in a position to establish the facts of its own motion, the benefit of the doubt is given to the patent proprietor (T.72/04). If the patent contains only an example with a hypothetical experimental protocol, and this example is to be relied on for showing sufficiency, then the burden of proof lies on the patentee to show that in practice this protocol works as stated. Evidence that a variation of this protocol works is unlikely to be enough (T.792/00). However, the patent at issue in T.397/02 disclosed a specific humanised version of a mouse antibody and also many specific alternatives thereof. The case was therefore not comparable to T.792/00 (or T.984/00) where not a single specific example of the claimed subject-matter was disclosed. Thus the appellant-opponent bore the burden of proving that the invention could not be carried out.

The board in T.63/06 agreed that the opponent generally bears the burden of proving insufficiency of disclosure. When the patent does not give any information as to how a feature of the invention can be put into practice, only a weak presumption exists that the invention is sufficiently disclosed. In such a case, the opponent can discharge his burden by plausibly arguing that common general knowledge would not enable the skilled person to put this feature into practice. It is then up to the patent proprietor to prove the contrary, i.e. that the skilled person's common general knowledge would enable him to carry out the invention (for a more recent example, see T.338/10, in which the board found that the opponent's reasoned arguments had reversed the **burden of proof**). In T.491/08 the board, referring to T.63/06 held that a presumption exists that, in general, a patent application relates to an invention which is disclosed in a manner sufficiently clear and complete for it to be carried out by a person skilled in the art. The weight of arguments and evidence required to rebut this presumption depends on its strength. A strong presumption requires more substantial arguments and evidence than a weak one. If a patent application does not contain detailed information of how to put the invention into practice, this requires less substantial arguments and evidence. Serious doubts whether the skilled person can carry out the invention as claimed, e.g. in the form of comprehensible and **plausible** arguments, are sufficient (see also T.347/15).

In T.518/10, the board looked at the rules concerning the burden of proof of insufficiency, which was, as a general rule, on the opponents. In the case at issue, the appellant (patent proprietor) had asserted that, against the prevailing technical opinion, by using the extraction method described in the patent in suit the skilled person was able to obtain from marine and aquatic animal material an extract comprising compound (II). The respondents denied this and provided evidence that compound (II) could not be obtained when working according to the general method described in the patent. Under these circumstances the burden of proof was on the appellant to show that the method in the patent worked as

alleged. The mere assumption that compound (II) could theoretically be present in an extract due to the krill's diet on algae was not evidence that could disprove the respondents' experimental reports or discharge the burden of proof resting on the appellant. The board also did not share the appellant's opinion that it was for the respondents, after having failed to obtain the claimed extract by following the teaching of the patent, to embark on a **research programme** in an attempt to find a compound which, according to the prevailing technical opinion, was not expected to be found in the first place, and for the presence of which not even the patent in suit provided conclusive evidence.

In T. 2571/12 the board disagreed with the conclusions of the opposition division that because no evidence had been provided by the opponent to show that any neuropsychiatric disorder could not effectively be treated using a glutathione precursor the patent in suit was considered as disclosing the invention in a manner sufficiently clear and complete for it to be carried out by a person skilled in the art. It is the patent that has to demonstrate the suitability of the claimed treatment for the claimed therapeutic indication. As explained, for example, in decision T. 609/02, a simple verbal statement that compound X may be used to treat disease Y was not enough to ensure sufficiency of disclosure: rather, it is required that the patent provides some information in the form of, for example, experimental tests, to the avail that the claimed compound has a direct effect on a metabolic mechanism specifically involved in the disease, this mechanism being either known from the prior art or demonstrated in the patent per se.

The established case law of the boards of appeal is that a finding of lack of sufficient disclosure should be based on serious doubts, substantiated by verifiable facts. The facts put forward by the examining division in ex parte case T. 1020/11 to justify a finding of lack of sufficient disclosure were based on a potential problem which might occur between different antigens in combination. There were however no verifiable facts on file that demonstrated that interference was a problem in the present, specific case. In the absence of such verifiable facts relevant to the specific case, the board could not find the objection of lack of sufficient disclosure persuasive (see also inter partes case T. 872/13 concerning a pharmaceutical composition) – the opponent described a number of possible difficulties that the skilled person might encounter, but did not raise any serious doubts substantiated by verifiable facts – in this case the skilled person was in a position to modify the method of Example 8 in order to obtain the desired result – routine modifications).

T. 1437/07 dealt with the objection that it was not credible that the therapeutic effect could be achieved because the treatment disclosed in Example 9 had not actually been carried out. The board referred inter alia to R. 42(1)(e) EPC according to which even the presence of an example was not mandatory. The board rejected the objection.

As proof that an invention has been insufficiently disclosed, the boards require that the attempt to repeat it must fail despite following the conditions given in the examples. This requirement is not fulfilled where the opponent repeats the patented process under conditions covered by claim 1 but differing in many respects from those applying in the contested patent's examples (T. 665/90). In T. 1712/09, the tests referred to in the opponent's experimental reports had been carried out using measuring apparatus different

from that described in the patent, and so not as instructed there. The board found that the opponent had made no attempt to reproduce the invention, although this was essential for an objection under Art. 100(b) and 83 EPC and would have enabled it not only to verify or disprove the results but, above all, to calibrate the method of determining the parameter or parameters in question to the values given in the patent. The board therefore held that the opponent had failed to show that the method was unworkable and thus to discharge its burden of proving insufficient disclosure. On the possibility of calibrating methods, see also T 1062/98, T 485/00 and T 45/09.

An invention should be reproduced using the examples given. Insufficiency cannot be proven on the basis of laboratory trials when the only embodiment exemplified in the patent is an industrial fermentation process (T 740/90). The disclosure was also considered sufficient where the opponent had only used equivalents of the surfactants given in the patent, as he had not discharged his burden of proof (T 406/91).

It was held in T 541/96 that if an invention seems to offend against the generally accepted laws of physics and established theories, the disclosure should be detailed enough to prove to a skilled person conversant with mainstream science and technology that the invention is indeed feasible, the onus being on the applicant (see also T 1023/00, T 1329/07 and T 1796/07). The more a new invention contradicts previously accepted technical wisdom, the greater the amount of technical information and explanation is required in the application to enable the invention to be carried out by the average skilled person to whom only that conventional knowledge is available (T 1785/06).

In ex parte case T 2340/12, the application related to a space energy implosion unit. The board observed that it did not understand how the torsion field or space energy was to be measured. The appellant (applicant) claimed that over 40,000 Internet citations could be found concerning "Space Energy". But no specific Internet citation was cited which could serve to explain the concepts of torsion field or space energy. The applicant only referred to "indirect" measurements carried out but did not elaborate on the nature of these experiments or on their relevance for the claimed invention despite having been invited to do so in the provisional opinion issued by the board. The examining division raised criticisms regarding the experiments. The appellant emphasised that the EPC does not contain any requirements for such experimental evidence to be provided. The appellant further questioned the competence of the examining division to require such evidence. The board stated that in the case of inventions in **fields of technology without any accepted theoretical or practical basis**, the case law of the boards of appeal has established that the application should contain all the details of the invention required for the effect to be achieved (cf. T 541/96, point 6.2 of the Reasons). This was the direct consequence of the fact that the skilled person will be unable to rely on common and accepted general knowledge when dealing with inventions in such fields. The board stated that there is no provision in the EPC according to which the grant of a patent depends on the filing by the applicant of evidence that the claimed invention performs satisfactorily in the form of results of experimentation. The filing of such results is **not** to be seen as **an obligation** imposed on the applicant **but**, in contrast, as a right, providing the applicant with the **opportunity to convince** the examining division (or the board) that it erred in its initial findings. The decision includes findings on the burden of proof in **ex parte** cases

(see for example, the summary of the rules established by the case law for inter partes cases given in T.967/09, point 6 of the Reasons).

in T.1273/09 the board had serious doubts that the claimed **homeopathic treatment** of hypertension could be reliably and reproducibly achieved by the mixture claimed for the following reasons, namely (i) because on the standards of "conventional" medicine and science it was inconceivable that a homeopathic medicament which did not contain any active substance achieved specific therapeutic effects and (ii) because on the standards of homeopathic medicine it was inconceivable that a homeopathic medicament that was not applied according to homeopathic principles could achieve **specific therapeutic effects**. The board could not conclude that the disclosure in the application – and this was the only source of information in the case at issue – put the skilled person in a position to achieve the claimed treatment of hypertension in a reliable and reproducible manner. The reason was **not**, as suggested by the appellants, a mere, **unsubstantiated "disbelief"**. Rather, the conclusion was drawn by taking into account the quality and quantity of available evidence.

See chapter III.G.5.1.2.c) "Sufficiency of disclosure".

D. Priority

1.	Introduction	399
2.	Applications giving rise to a right of priority	400

1. Introduction

Art. 87 to 89 EPC govern the concept of priority under the EPC.

According to Art. 87(1) EPC, any person who has duly filed, in or for (a) any State party to the Paris Convention for the Protection of Industrial Property or (b) any Member of the World Trade Organization, an application for a patent, a utility model or a utility certificate, or his successor in title, shall enjoy, for the purpose of filing a European patent application in respect of the same invention, a right of priority during a period of twelve months from the date of filing of the first application.

The right of priority is generally regarded as one of the cornerstones of the Paris Convention. Its basic purpose is to safeguard, for a limited period, the interests of a patent applicant in his endeavour to obtain international protection for his invention, thereby alleviating the negative consequences of the principle of territoriality (T.15/01, OJ 2006, 153).

Art. 87 to 89 EPC provide a complete, self-contained code of rules on claiming priority for the purpose of filing a European patent application (see J.15/80, OJ 1981, 213, confirmed in e.g. J.9/07). However, since the EPC – according to its preamble – constitutes a special agreement within the meaning of Art. 19 of the Paris Convention, it is clearly intended not to contravene the basic principles concerning priority laid down in the latter (see T.301/87, OJ 1990, 335; G.3/93, OJ 1995, 18 and G.2/98, OJ 2001, 413).

Furthermore, in view of Art. 87(1) and (2) EPC, the priority system adopted by the European legislator also recognises "internal priorities" (T.15/01, OJ 2006, 153). In this context the question of double patenting has arisen – relevant decisions and also the points of law referred to the Enlarged Board of Appeal in case **T 318/14** can be found in chapter II.F.5.

The EPO does not normally check the validity of a priority right during examination. A check must be made, however, if relevant prior art has been made available to the public within the meaning of Art. 54(2) EPC on or after the priority date claimed and before the date of filing (priority interval) or if the content of the European patent application is totally or partially identical with the content of another European application within the meaning of Art. 54(3) EPC, such other application claiming a priority date within the above-mentioned period (Guidelines F-VI, 2.1 – November 2018 version). In opposition proceedings this applies where prior art is invoked in connection with a ground for opposition under Art. 100(a) EPC in relation to which the priority date is of decisive importance (Guidelines D-III, 5 – November 2018 version). Failure by the respective division to check the validity of the priority right in the circumstances described has been held to be a substantial procedural violation (see T.16/89, T.737/95, T.2170/08). On publications during the priority interval, see also G.3/93 (OJ 1995, 18), summarised in chapter II.D.5.1.

For issues of evidence concerning the validity of the priority claim, see also chapter III.G.4.3.5 and III.G.5.1.2 d). For decisions on the correction of the priority declaration,

see chapter [IV.A.8.2. J.13/16](#), a decision concerning the remedy of restoration of the right of priority under [R.49ter.2.PCT](#), is reported in chapter [VI.3](#).

2. Applications giving rise to a right of priority

2.1. Application filed in or for a state which is party to the Paris Convention or a member of the WTO

Under the EPC 2000 [Art. 87\(1\) EPC](#) was amended to align it with Art. 2 TRIPS, which requires that priority rights also be extended to first filings made in or for any member of the World Trade Organization (WTO) (OJ SE 4/2007, 88). The revised provision governs applications filed on or after 13 December 2007.

Previously, in [G 2/02](#) and [G 3/02](#) (OJ 2004, 483) the Enlarged Board decided that the obligations deriving from the TRIPS Agreement did not bind the EPO directly and did not therefore entitle the applicant for a European patent to claim priority from a first filing in a state which at the relevant dates was not a member of the Paris Convention but was a member of the WTO/TRIPS Agreement.

2.2. Right of priority of the applicant or his successor in title

2.2.1 General

Pursuant to [Art. 87\(1\) EPC](#), a right of priority originates in the applicant of a first application. Therefore, in principle, the applicant has to be the same for the first application and for the subsequent application for which the right of priority is invoked. However, pursuant to [Art. 87\(1\) EPC](#), the right of priority may also be invoked by the "successor in title" of the person who has filed the first application. By reference to the "successor in title", it is recognised that the right of priority, being a legal right, may be transferred from the original applicant to a third person. It is generally accepted that the right of priority is transferable independently of the corresponding first application and may furthermore be transferred to a third person for one or more countries only. It is an independent right until it is invoked for one or more later applications, to which it becomes an accessory, and it has to be distinguished from the right to the patent deriving either from substantive law or from the status of being the applicant of the first application ([T.205/14](#), with further references; see also [T.969/14](#); and [T.1201/14](#) with further references).

The transfer must have occurred before the filing date of the subsequent application. According to [T.1201/14](#), it was clear from the wording of [Art. 87\(1\) EPC 1973](#) alone that the succession in title must have already taken place when the subsequent application was filed. The board in [T.577/11](#) already confirmed that a succession in title that occurred after the filing date of the subsequent application was not sufficient to comply with the requirements of [Art. 87\(1\) EPC 1973](#). This finding was in line with Art. 4 Paris Convention and the legislative history of these provisions.

Where there were several applicants for the first application and one of them is the sole applicant for the subsequent application, the other co-applicants must have transferred the

joint priority right to the sole applicant of the subsequent application before its filing date (see T.382/07, with further references).

See also the decisions in chapter II.D.4. "First application in respect of the invention", II.D.4.2. "Identity of applicant".

The board in T.969/14 held, with reference to Enlarged Board decision G.1/15 ("Partial priority", OJ.2017.A82), that once it is acknowledged that partial priority rights exist they must also be transferable separately. This, however, has consequences for the remaining priority right, because the assignor is left with a limited right. On partial and multiple priorities, see also in this chapter II.D.5.

2.2.2 Applicable law – proof of transfer

In T.1201/14 the board observed with regard to the formal requirements for the transfer of the right of priority that, as the EPC contained neither guidance nor conflict-of-law provisions for that purpose, national law was commonly relied upon by the departments of the EPO entrusted with the procedure. The board also acknowledged that there was no established jurisprudence of the boards as to the national law generally applicable to this question.

In T.1008/96 the European patent application resulting in the patent in suit and the two Italian utility model applications from which priority was claimed had been filed by different persons. The board held that the succession in title had to be proven to its satisfaction. It was a general principle of procedural law that any party claiming a right had to be able to show that it was entitled to that right (see J.19/87). This question had to be answered in accordance with national law. The board concluded that the respondent had failed to prove that it was the successor in title in respect of the two Italian utility model applications. Consequently, no priority rights existed for the patent in suit.

In T.62/05 the board pointed out that the EPC did not contain any regulations on the formal requirements that an assignment of priority rights for the filing of a European patent application should fulfil in order to be considered valid for Art. 87(1) EPC.1973. However, having regard to the crucial effect that a valid priority date has on patentability (cf. Art. 89 EPC.1973), and to the fact that, in the case at issue, the validity of the priority claim depended on the validity of the transfer of the ownership of the right of claiming priority from the Japanese first filing for the European patent application, such transfer of priority rights, in the board's view, had to be proven in a formal way (by analogy with T.1056/01 – also summarised in chapter III.G.4.3.5). It hence appeared reasonable to the board to apply an equally high standard of proof as that required for the assignment of a European patent application by Art. 72 EPC.1973, which, however, the board concluded was not met here. Furthermore, the appellant could not convince the board that an assignment had taken place implicitly and tacitly before the end of the twelve-month period or that it would have been illogical for the applicant of the priority application to assign the application to the applicant for the patent in suit without assigning the corresponding priority rights.

In T.160/13 the board confirmed that the opposition division had rightly examined the transfer of the priority right on the basis of German law, which called for a bilateral declaration of transfer by both applicants (§§ 398 and 413 in conjunction with §§ 145 ff. of the German Civil Code (BGB)). Such declarations were not subject to any particular formal requirements under German law, and no other requirements of a formal nature could be inferred from the decisions cited by the appellant, T.1056/01 and T.62/05. In the board's view the correspondence on file provided ample proof of the transfer.

The board in T.205/14 pointed out that neither Art. 87 EPC 1973 and Art. 88 EPC nor R. 52 and 53 EPC set out any requirement for determining the law governing transfer of the priority right. It disagreed with the reasoning of T.62/05 (see above) that the transfer had to be proven in a formal way, applying an equally high standard of proof as that required by Art. 72 EPC 1973. Art. 72 EPC 1973 set out formal requirements for a valid assignment of a European patent application and thereby limited the means of giving or obtaining evidence for determining such a transfer. Having regard to Art. 117 EPC and the principle of free evaluation of evidence, the rule should not be extended beyond its scope of application. Art. 72 EPC 1973 constituted harmonised law with respect to the formal requirements for a transfer of a validly filed European patent application, and no reason was apparent for applying it by analogy in the context of a transfer of the priority right preceding a subsequent filing. To do so in view of a subsequent European patent application would, in the case of a European first filing, ignore the fact that the priority right is a right independent of the right to the first application and, in the case of a non-European first filing, that Art. 72 EPC 1973 does not govern the relationship between the applicant of a European patent application and a different applicant of a distinct first application. Art. 72 EPC 1973 and R. 20 EPC 1973, and the related provisions (Art. 60(3) EPC 1973 and Art. 61 EPC), rather defined the conditions under which the EPO may take into account questions of substantive law and procedural acts by a person other than the registered applicant (J.2/01, OJ 2005, 88, point 3 of the Reasons). The board came to the same conclusion as the German Federal Supreme Court in its decision of 16 April 2013 that Art. 87 EPC does not require a formal and separate assignment as provided by Art. 72 EPC.

Furthermore, since the provisions of the EPC did not lend themselves to an autonomous determination of the requirements for transfer of the priority right, the validity of such transfer was a matter of national law (cf. T.1008/96; cf. also approach in T.160/13, J.19/87, T.493/06). In the circumstances of those cases, however, the **choice of applicable national law** did not seem to be an issue. In none was the law of the state for which protection was sought by the subsequent filing considered to be relevant, nor did they provide guidance on whether the law applicable to the legal relationship between the transferor and the transferee (e.g. corporate agreement, employment contract, or universal succession) should apply, or the law of the state of filing of the first application. This point of law was, however, relevant to the decision in hand. Accordingly, the board considered both the law applicable to the legal relationship between the transferor and the transferee of the priority right and the law of the state of filing of the first application and concluded that the former – in this case the law of the state of the employment relationship between the applicants (inventors) of the US provisional applications from which priority was claimed and the patent proprietor (here the law of Israel) – determined the transfer.

On the basis of the evidence before it, the board was satisfied both that Israeli law did not require an assignment in writing signed by both parties and that the priority right had been transferred to the patent proprietor before the date of filing of the international application underlying the patent in suit. See also T 517/14.

According to the board in T 577/11, where the applicant of the priority application and the applicant of the subsequent application contractually agree that (only) economic ownership ("economische eigendom" under Dutch law) of the priority application and the right to claim its priority is to be transferred to the subsequent applicant, this is not sufficient to consider the latter a successor in title within the meaning of Art. 87(1) EPC 1973 (see decision catchword). The board recognised the retroactive effect of the transfer of "economic ownership" but not of the legal title. It concluded that at the time of filing of the subsequent application this arrangement only amounted to a limited transfer, insufficient for the purposes of Art. 87(1) EPC 1973. Furthermore, this case was to be distinguished from the situation of equitable assignment under English law, which was the subject of J 19/87.

Considering the requirement that the right of priority must have been transferred before the filing date of the later European application, the board in T 1201/14 took the view that, even if a retroactive transfer such as the *nunc pro tunc* assignment under US law invoked by the appellant was allowable under US law, it would not be acceptable under Art. 87(1) EPC 1973. The board also held that an implied transfer of a particular right could be accepted when it was sufficiently clear that the parties had formed an agreement and what they had agreed. The burden of proving a valid transfer of the right of priority lay with the proprietor since it was the one claiming that right. As to the standard of proof to be applied to an implied transfer by virtue of a general policy under German law, the board held that the circumstances of the case in hand required proof "beyond reasonable doubt", as all the relevant evidence lay within the knowledge and power of only one party to the inter partes proceedings.

In T 493/06 it was held that the respondents had provided sufficient proof of the assignment of priority rights. In the board's view even a copy of an assignment agreement could be sufficient provided that evidence was supplied that the content of the copy was identical to that of the original document. Such evidence might, according to board of appeal case law, take the form of an affidavit – even though affidavits were not expressly mentioned in Art. 117(1) EPC 1973 – and the principle of unfettered consideration of the evidence applied to them (see e.g. T 970/93, T 804/94, T 558/95 and T 43/00; also T 535/08).

According to the board in T 1103/15, if a party made statements about conclusions to be drawn on the basis of the applicable national law, it had to file suitable evidence, for example by filing as documents adequate copies of such laws and/or as appropriate by filing as expert evidence the opinions of a suitably qualified lawyer in the relevant jurisdiction (T 74/00).

The board in T 2466/13 observed that there was no clear line in the boards' case law on the standard of proof to be met for a transfer of a priority right to be considered valid

(compare [T.205/14](#) and [T.517/14](#), applying the balance of probabilities, with [T.1201/14](#), in which a stricter standard was applied).

See also [T.404/13](#), [T.725/14](#), as well as the decisions in chapter [II.D.4.2](#).

2.3. National deposit of industrial design

In [J.15/80](#) (OJ 1981, 213) it was held that a priority right based on the deposit of an industrial design was not recognised for a European patent application. As the EPC was a special agreement within the meaning of Art. 19 of the Paris Convention, a general understanding by the EPC contracting states that the deposit of an industrial design clearly gave a priority right for a national patent application could, by application of Art. 4 Paris Convention, lead to an interpretation of [Art.87\(1\)EPC.1973](#) going beyond its terms. However, in the absence of such a general understanding there was no reason to read [Art.87\(1\)EPC.1973](#) more broadly than its express terms and scope required. In the board's opinion, a right of priority under the Paris Convention existed if the prior application was for the protection of an invention as such and contained a disclosure of it. The deposit of an industrial design in essence protected aesthetic appearance. Although the deposited design might incorporate an invention, according to national design laws the deposit would not protect the invention as such.

2.4. Exhibition priority

In [T.382/07](#) it was held that an exhibition priority could not be validly claimed for a European application or patent. The board stated that the possibility of recognising exhibition priorities internationally followed from Art. 11 Paris Convention. Its provisions allowed Paris Union member countries to recognise exhibition priorities in their domestic law under certain conditions but did not oblige them to do so. Entitlement to claim an exhibition priority was to be decided on the basis of the national law of the country where protection and priority were claimed, i.e. for a European application or patent the EPC, and not the law of the country where the exhibition took place or a first application claiming the exhibition priority was filed. Since the EPC did not recognise exhibition priorities, any priority claim based on an invention disclosure at an exhibition must fail in the case in hand.

2.5. Postdating of the previous application

Swiss patent law formerly allowed a patent application to be postdated if it was subsequently amended. In [T.132/90](#) the patent proprietor had claimed 11.3.1983, the original filing date of the earlier Swiss application, as the priority date for his European application dated 9.3.1984. In 1985 the Swiss Patent Office ordered that the filing date of the Swiss patent application be set at 1.7.1983 following subsequent completion of the technical documentation. The board concluded that the original application should serve as the basis for claiming a priority right and that the priority date was the filing date of the original application. The postdating order did not take effect ab initio, and the subsequent fate of the original application was immaterial as far as the priority date was concerned.

2.6. Multiple exercise of the right of priority for one contracting state

According to the board in T 998/99 (OJ 2005, 229), Art. 87(1) EPC 1973 made no provision for multiple filings in the same country within the priority period for the same subject-matter and hence the same invention on the basis of the same priority document. However, in subsequent decisions this strict approach was rejected.

Thus, in T 15/01 (OJ 2006, 153) the board pointed out that, with respect to the issue of exhaustion of priority, the wording of Art. 87(1) EPC 1973 appeared to be open to different interpretations. Since the EPC constituted a special agreement within the meaning of Art. 19 of the Paris Convention, this provision was not intended to contravene the basic priority principles of this Convention. The Paris Convention in its present version explicitly recognised the possibility of claiming multiple and partial priorities and guaranteed the right to divide patent applications while preserving the benefit of the right of priority for the divisional application as well (principles also recognised in Art. 76(1), second sentence, EPC 1973 and Art. 88(2) and (3) EPC 1973). The board considered that the priority provisions of the Paris Convention had to be construed in a manner which ensured that the general purpose they served, namely to assist the applicant in obtaining international protection for his invention, was fulfilled as far as possible. The board also examined the circumstances under which the issue of exhaustion might arise (splitting up of the subject-matter of the priority application to avoid non-unity objections; filing of a deficient subsequent application and remedying it by means of a second filing; combination of the originally disclosed subject-matter with further improvements and additional embodiments developed during the priority period) and analysed the interests involved. It concluded that the same priority right might be validly claimed in more than one European patent application; there was no exhaustion of priority rights. In T 5/05 the board again confirmed that neither the EPC nor the Paris Convention contained any indication that the right of priority constituted an exception which had to be interpreted narrowly and thus allowed the right of priority to be exercised only once for one contracting state. These decisions were followed in T 1562/06.

3. Identity of invention

In accordance with Art. 87 EPC a European patent application is only entitled to priority in respect of "the same invention" as was disclosed in the previous application. See also Art. 88(2) to (4) EPC.

3.1. Disclosure in the previous application of the invention claimed in the subsequent application

3.1.1 G 2/98 – interpretation of "the same invention"

In G 2/98 (OJ 2001, 413), the Enlarged Board of Appeal, ruling on points of law referred by the President regarding the interpretation of Art. 87(1) EPC 1973, addressed the concept of "the same invention" in this provision. It first considered whether interpreting "the same invention" narrowly was consistent with the relevant Paris Convention and EPC 1973 provisions. A narrow interpretation meant that the subject-matter of a claim

which defined the invention in a European patent application – i.e. the specific combination of features in that claim – had to be at least implicitly disclosed in the application whose priority was claimed. The Enlarged Board held that a broad interpretation, distinguishing between those technical features which related to the function and effect of the invention and those which did not – with the result that an invention could still be considered "the same" even if a feature were amended, deleted or added – was inappropriate and prejudicial to a proper exercise of priority rights. To ensure a practice fully consistent, *inter alia*, with equal treatment for applicants and third parties, legal certainty and the principles for assessing novelty and inventive step, "the same invention" had to be interpreted narrowly and in a manner equating it to "the same subject-matter" in Art. 87(4) EPC 1973. This interpretation was underpinned by the Paris Convention and the EPC 1973, and was entirely consistent with opinion G 3/93 (OJ 1995, 18).

The Enlarged Board therefore ruled that the requirement for claiming priority of "the same invention", referred to in Art. 87(1) EPC 1973, means that priority of a previous application in respect of a claim in a European patent application in accordance with Art. 88 EPC 1973 is to be acknowledged only if the skilled person can derive the subject-matter of the claim **directly and unambiguously**, using common general knowledge, from the previous application as a whole. The subject-matter of the claim defining the invention in the European application has to be understood as "the specific combination of features present in the claim".

3.1.2 G 2/98 and the concept of disclosure – interpretation in the same way as for Art. 123(2) EPC

It may be noted that following G 2/98 (OJ 2001, 413) the older case law which devised the "disclosure" test still applies (see e.g. T 184/84, T 81/87, OJ 1990, 250, T 469/92, T 269/93, T 77/97). In T 311/93 and T 77/97 in particular, the boards applied the criterion of at least implicit disclosure used for the disclosure test under Art. 123(2) EPC 1973. On the other hand, G 2/98 rejected the approach taken in T 73/88 ("Snackfood", OJ 1992, 557; cf. also e.g. T 16/87, OJ 1992, 212; T 582/91; T 255/91, OJ 1993, 318; T 669/93; T 1056/93 and T 364/95), according to which adding non-essential and merely scope-limiting features did not invalidate a priority claim; see also "Case Law of the Boards of Appeal of the EPO", 3rd ed. 1998, p. 228 et seq. and 235 et seq.). The non-applicability of the "essentiality" criterion following G 2/98 was recently confirmed in e.g. T 1852/13 (with further references) and T 2466/13.

As was stated in G 2/98 (OJ 2001, 413), the extent of the right to priority is determined by, and at the same time limited to, what is disclosed in the priority application. Applying G 2/98, the board in T 923/00 found that the application as filed and the priority document were in essence identical. It emphasised that any conclusion in favour of or against the amendments' allowability under Art. 123(2) EPC 1973 would also apply in favour of or against entitlement to the claimed priority, and dealt with both issues jointly.

In its subsequent "disclaimer" decisions G 1/03 and G 2/03 (OJ 2004, 413 and 448), the Enlarged Board held that in order to avoid any inconsistencies, the disclosure as the basis for the right to priority under Art. 87(1) EPC 1973 and as the basis for amendments in an

application under Art. 123(2) EPC 1973 have to be interpreted in the same way. That meant that a disclaimer, not providing a technical contribution as outlined, which was allowable during the prosecution of a European patent application does not change the identity of the invention within the meaning of Art. 87(1) EPC 1973. Therefore its introduction is allowable also when drafting and filing the European patent application without affecting the right to priority from the first application, which does not contain the disclaimer (see also T 175/03 and T 910/03). The Enlarged Board reaffirmed the importance of applying a uniform concept of disclosure in its further "disclaimer" decisions G 2/10 (OJ 2012, 376) and G 1/16 (OJ 2018, A70) – cf. "gold standard" disclosure test.

For the application of the disclosure test in the context of Art. 123(2) EPC, see chapter II.E. "Amendments".

The following qualification was made in T 282/12, a case which concerned "partial priority" (cf. also G 1/15, OJ 2017, A82): assessing priority by performing a test under Art. 123(2) EPC could lead to wrong conclusions in certain circumstances because the concept of "partial" validity of an amendment does not exist, whereas "partial priority" does (see also fuller summaries in chapters II.D.4.1. and II.D.5.3.3 below).

3.1.3 Disclosure in the previous application as a whole

G 2/98 (OJ 2001, 413) stated that pursuant to Art. 4H Paris Convention, priority may not be refused on the ground that certain elements of the invention for which priority is claimed do not appear among the claims formulated in the application whose priority is claimed, provided that the application as a whole specifically discloses such elements. Priority for a claim is to be acknowledged if the subject-matter of the claim is specifically disclosed, be it explicitly or implicitly, in the application documents relating to the disclosure, in particular, in the form of a claim or of an embodiment or example specified in the description of the application whose priority is claimed. Art. 88(4) EPC corresponds almost literally to Art. 4H Paris Convention.

In earlier decisions it was likewise held that, under Art. 88(4) EPC, it suffices if the features claimed in the later application are disclosed by the earlier application taken as a whole (T 184/84, T 497/91 and T 359/92).

If the priority document does not include any claims, this does not mean that the conditions of Art. 88(4) EPC are not fulfilled; Art. 88(4) EPC cannot be construed as meaning that a priority document must comprise claims in order to form a regular national filing within the meaning of Art. 87(3) EPC which can give rise to a right of priority (T 469/92). While in such a case it could be more difficult to establish whether the priority document discloses the same invention, the principles of G 2/98 equally apply (T 1437/10). See also e.g. T 525/13, in which the right of priority claimed from a US provisional application was held invalid.

In T 515/00 the board further noted that comparing the claim with the corresponding claim of the previous application was not a valid approach (see also summary in this chapter II.D.3.2.).

T 409/90 (OJ 1993, 40) showed that a broad claim in the previous application was not necessarily a suitable basis for a priority right. When considering what was disclosed in a priority document's claim it was necessary to bear in mind the purpose of the claim, i.e. to define the protection sought. The fact that a claim in a priority document was broad enough to cover specific subject-matter filed for the first time in a later application was not by itself sufficient evidence that such subsequently filed subject-matter had already been disclosed in the priority document, or that subsequent claims based on the later-filed subject-matter still defined the same invention as that which was the subject of the priority document (see also T 77/97, summarised in chapter II.D.3.1.8 below).

Features of the invention may also be disclosed in the drawings (T 169/83, OJ 1985, 193; T 837/13; also T 1434/13, in which the drawings of the priority document were found not to show all the alternatives of claim 1).

In T 449/04 the board emphasised that the "same invention" considered in Art. 87(1) EPC 1973 did not encompass the comparative example(s) which were clearly and definitely **excluded** from the scope of the invention in an earlier application of the applicant (see also fuller summary in this chapter II.D.4.1.).

3.1.4 Reference to common general knowledge

The priority of a previous application in respect of a claim in a European patent application in accordance with Art. 88 EPC is to be acknowledged only if the skilled person can derive the subject-matter of the claim directly and unambiguously, using common general knowledge, from the previous application as a whole (G 2/98, OJ 2001, 413).

According to earlier decision T 136/95 (OJ 1998, 198), a patent application is a technical document, addressed to the skilled person, not a work intended for the general reader. However, the skilled person is not familiar, unlike in the assessment of inventive step, with all the prior art, but only with those elements of it which form part of his general knowledge, and it is on the basis of this knowledge, or by carrying out simple operations derived from it, that he may infer whether or not there is identity of invention. In the case in question a **structural feature** claimed in the European application was supported by a **general functional feature** described in the prior application.

Applying G 2/98 (OJ 2001, 413), the board in T 744/99 held that the application of common general knowledge could only serve to interpret the meaning of a technical disclosure and place it in context; it could **not** be used to **complete** an otherwise incomplete technical disclosure. In the case in hand, since the priority document only disclosed a new signal protocol without any disclosure of a suitable receiver, claim 8 of the subsequent application, which was directed to such a receiver, was not entitled to the claimed priority date.

In T 1312/08 the patent proprietor had submitted that the definition of "PU" was correct in the patent in suit but erroneous in the priority document. The board, referring to the established jurisprudence, stated that the reworking of an example and especially of a method which was not a standardised one and was not reported in encyclopaedias,

textbooks, dictionaries and handbooks could not be considered to be the application of common general knowledge. The mere fact that it was necessary to carry out a test, which was not part of common general knowledge, in order to find out whether the definition of PU in the priority document was erroneous made it clear that the different definition of PU used in the patent in suit was not derivable directly and unambiguously, using common general knowledge, from the whole content of the priority document. See also T 1579/08.

3.1.5 Explicit or implicit disclosure of the features of the invention in the priority document

In G 2/98 (OJ 2001, 413) the Enlarged Board stated that priority for a claim, i.e. an "element of the invention" within the meaning of Art. 4H Paris Convention, is to be acknowledged if the subject-matter of the claim is specifically disclosed, be it explicitly or implicitly, in the application documents relating to the disclosure, and priority can be refused if there is no such disclosure.

Already in decision T 81/87 (OJ 1990, 250), it had been held that, although no identical wording was required, the disclosure of the essential elements, i.e. features of the invention, in the priority document, must either be express, or be directly and unambiguously implied by the text as filed (see also fuller summary of T 81/87 in chapter II.D.3.1.6. below; see also T 184/84). T 81/87 has been followed in numerous decisions, both before and after G 2/98 (e.g. T 301/87, OJ 1990, 335; T 296/93, T 479/97, T 342/98).

a) Example cases – features of the invention all disclosed in the priority document

In T 289/00 the contested feature of Claim 1 was that a channel was enclosed on all sides. The board accepted that the reference in the priority application to the channel as "filled with air" did not in itself mean that it was enclosed. However, the reference had to be seen together with the other information on this matter which the skilled person would derive from the application (cf. Art. 88(4) EPC 1973). A skilled person considering the priority application documents as a whole would conclude, without further information, that the channel would be enclosed on all sides.

The patent at issue in T 578/08 contained only device claims, whereas the previous application contained only process claims (the description and the drawings being largely identical). However, the board found that the wording of the previous application's claim 1 already presupposed structural device components in addition to specifying process steps that could only be performed by suitable – and so structural – technical means. General technical means suitable for performing the specified functions were therefore implicitly disclosed. Besides, the previous application repeatedly explained that the process described and claimed was performed automatically, which likewise called for suitable technical means. Priority was thus validly claimed.

b) Example cases – features of the invention not all disclosed in the priority document

In T 1052/93 it was a feature of the wash adjunct products claimed in the European patent that they contained sodium perborate monohydrate in conjunction with a **functionally defined activator**. The priority document only mentioned certain activators complying with

the functional definition in the European patent; these specific compounds could not be considered to disclose the broad group of activators functionally defined in claim 1 of the European patent. See also T.132/09.

In T.277/95 the board found that a claim to a method of producing in CHO cells hEPO characterised by the presence of a specific **glycosilation pattern** did not enjoy priority from a priority application which made available the cell line but gave no information on the specific glycosilation pattern. See also T.479/97.

In T.908/09 the board concluded that the priority document did not clearly allocate to one single group the classes of substances which were named in granted claim 1 as components b). Accordingly, the skilled person could not derive directly and unambiguously from the priority document a mixture of at least one substance a) with at least one substance b), as was required by claim 1.

In T.521/10 the enabling disclosure for the embodiment of claim 1 relied on the content of patent applications incorporated by reference. The reference to one of these (D9) was not present in the priority document. Indeed, D9 was not filed until after the claimed priority date. Therefore, as far as the subject-matter of claim 1 was based on the disclosure of D9, the priority was not validly claimed. As D9 was published before the filing date, it was pertinent prior art. See also summary of this decision in chapter II.C.4.2.

In T.846/10 the US priority application P1 claimed (on Form PTO/SB/01 (12-97)) the benefit under 35 U.S.C. 119(e) of two provisional applications P2 and P3. The board rejected the appellant's claim that their contents were for this reason to be considered incorporated by reference into the disclosure of P1; P1 itself contained no mention of "incorporated by reference" or any equivalent expression.

3.1.6 Enabling disclosure in the priority document

The decisions below highlight that the priority document must disclose the invention claimed in the subsequent application in such a way that it can be carried out by a person skilled in the art.

In T.81/87 (OJ 1990, 250) the board took the view that the argument that the skilled person would supplement the disclosure from his common general knowledge to make it work, should any difficulty be encountered, was no excuse when this was a feature of the definition of the invention, and was missing, not envisaged by the inventor and not implied by the description. In order to give rise to priority rights the essential elements, i.e. the features of the invention, in the priority document had to be either expressly disclosed or directly and unambiguously implied in the text as filed; missing elements recognised as essential only later on were not part of the disclosure, and gaps with regard to basic constituents could not be retrospectively filled by relying on knowledge acquired in this manner. It could become a misuse of the priority system if some parties in a competitive situation were allowed to jump ahead of others on the basis of mere expectations and by omitting the critical features of the invention altogether. This decision was followed in e.g. T.301/87, OJ 1990, 335, and in T.296/93, OJ 1995, 627.

The board in T.301/87 (OJ 1990, 335) considered that if an entity itself is disclosed to the skilled person, this does not necessarily mean that a component part is also disclosed for the purpose of priority if this cannot be envisaged directly and unambiguously as such, and requires considerable investigation to reveal its identity.

In T.296/93 (OJ 1995, 627) the board rejected the argument that the priority document was deficient in respect of relevant technical information necessary for reducing the claimed invention to practice by the person skilled in the art without undue burden. See also T.207/94 (OJ 1999, 273), T.767/93, T.20/04.

In T.919/93 the board found that certain passages in the European application as filed, essential for the application to meet the requirements of Art. 83 EPC 1973, had no counterpart in the priority document, which was thus not enabling for the claimed subject-matter.

In T.843/03 the board referred to the requirement that the priority document provide an enabling disclosure (T.81/87, OJ 1990, 250; T.193/95). It had been established in a number of board of appeal decisions that sufficiency of disclosure presupposes that the skilled person is able to obtain substantially all embodiments falling within the ambit of the claims and that he/she, in order to reach this goal, may not be confronted with an undue burden. Based on previous case law on the requirement of Art. 83 EPC 1973 (T.19/90, OJ 1990, 476) and on the novelty requirement (T.464/94) the board concluded that, when an applicant provided a technical disclosure and **prima facie evidence** as to certain technical elements in an application, **it was the EPO which had the burden of proof** when judging that something was not shown. The board held that the examining division had not taken the legally appropriate approach when deciding to the disadvantage of the applicant with the reason that "[...] no absolute fact can be deduced from figure 7 as to whether it shows correctly formed HPV 16 particles or not". The board did not see full proof of such facts as a requirement within the framework of the EPC and could not see any serious doubts of the examining division substantiated by verifiable facts.

In T.903/05 the board, in applying G.2/98 (OJ 2001, 413), saw no legal basis for imposing additional criteria such as the presence of experimental data in the priority document which made it plausible that the invention would work. The board was furthermore convinced that the experimental data which were present in the patent and not in the priority document did not change the nature of the invention disclosed. See also T.1834/09.

According to the board in T.107/09, the antibody MR1 was indispensable in order to reproduce the invention of claim 1. The "written" disclosure in the earlier US application from which priority was claimed, even if supplemented by common general knowledge, would not enable the skilled person to carry out the invention. The hybridoma cell line producing the antibody MR1 had been deposited with the ATCC (American Type Culture Collection) only after the filing date of the earlier application. In view of the absence of explicit provisions in the EPC as to when a deposit of biological material had to be made in relation to an earlier application (R.28 EPC 1973 being concerned with European applications), the board referred in particular to decision G.1/03, according to which the requirement of sufficiency of disclosure had to be complied with – in relation to an earlier

application from which priority was claimed – at the date of filing of that application. Thus, the board reasoned, if the deposit of biological material was necessary for the requirement of sufficiency of disclosure to be fulfilled for a "priority application", the deposit of this material had to have been made no later than the date of filing of that earlier application. This was not the case here.

3.1.7 Error margins and definitions of limits

Prior to G 2/98 (OJ 2001, 413), it was sometimes possible to claim error margins or definitions of limits which differed in the subsequent application from the original one (see T 212/88, OJ 1992, 28; T 957/91; T 65/92; T 131/92 and "Case Law of the Boards of Appeal of the EPO", 3rd ed. 1998, p. 231 et seq.). Since the facts are only comparable up to a certain point, it is not possible to say unequivocally to what extent the principles laid down earlier still apply. In the decisions below, G 2/98 was applied.

In T 201/99 claim 1 referred to a **mean residence time** of "1-10 minutes", whereas both priority applications disclosed the range "from about 1-6 minutes" (claim 1) or, for all the examples, a specific residence time of "about 3 minutes". The board found that the features disclosed in the priority applications provided no explicit or implicit disclosure of a process wherein the second step lasted "10 minutes". Therefore it was apparent that they were insufficient to render directly and unambiguously disclosed therein also the whole range of "1-10 minutes". The board did not accept the appellant's argument that the upper limit of "6 minutes" for the time length of the second step was not disclosed in the priorities as a cut-off value (i.e. as possibly related to the function of the invention and its effect) and thus constituted a feature which might be modified without changing the nature of the invention.

In T 250/02 the board found that the subject-matter of a claim for a herbal essential oil in which the total amount of carvacrol and thymol was at least 55%, and preferably 70%, by weight of the said essential oil and with exact ratios of carvacrol to thymol could not be derived directly and unambiguously from a priority document only disclosing a herbal oil containing "thymol and carvacrol in levels of 55% to 65%".

Further decisions concerned with differing ranges indicated in a priority document and disputed sets of claims include T 903/97, T 909/97, T 13/00, T 136/01, T 423/01, T 788/01, T 494/03 and T 537/03.

3.1.8 Selection from generic disclosure

A generic disclosure implicitly encompassing two or more alternative embodiments cannot generally give rise to a right of priority in respect of one specific embodiment that is **neither explicitly nor implicitly** disclosed (T 61/85; also T 30/01 below).

In T 85/87 the priority document disclosed a generic chemical formula, while a dependent claim of the application in suit was directed to a specific compound. Applying the principles which it had previously developed with respect to the novelty of specific (individual) chemical compounds over a generic disclosure of a group of compounds, the board

concluded that the specific compound was not disclosed in the priority document. Therefore the subject-matter of the dependent claim was not entitled to priority and, as a result, was anticipated by the disclosure of the same specific compound in another European patent application within the meaning of Art. 54(3) EPC.

According to the board in T.77/97, a chemical compound according to a dependent claim in a European patent application could not be granted priority simply because it fell within the scope of the claims in the priority document, and so was covered by its disclosure, and could be readily prepared on the basis of the information provided there (see T.409/90, OJ 1993, 40). Art. 88(4) EPC required, moreover, that the elements for which priority was claimed, i.e. all the features essential for defining the chemical compound, including those distinguishing it from the generic group disclosed and claimed in the priority document, be specifically disclosed in that document. In the case in hand, the board found that each of the compounds according to claims 4 and 5 were part of the "purely conceptual content" of the priority document's claim 3 but not part of its actual teaching. That meant they could not be regarded as "specifically disclosed" by this document, and so the two claims could not be granted the claimed priority. See also T.295/87 (OJ 1990, 470).

T.30/01 concerned an apparatus for optical imaging and measurement. The board noted that the description of the priority document unmistakably indicated the provision of the light steering means "in the sample arm". This precise disclosure deprived of support the appellant's construction of the disclosure as implicitly disclosing the provision of the light steering means in and outside the probe as two complementary alternative implementations – let alone as disclosing any specific one of these two alternatives by way of "implicit disclosure" by reference to common general knowledge (T.823/96, T.744/99 and T.818/00). According to the criterion consistently applied by the boards of appeal, a generic disclosure **implicitly encompassing two or more alternative embodiments** can generally not give rise to a right of priority in respect of a **specific one of the embodiments** that is neither explicitly nor implicitly disclosed (T.61/85) the latter criterion being a particular form of the "disclosure test" laid down in G.2/98 (OJ 2001, 413) and constituting the logical corollary of the established principle – confirmed in G.2/98 (see also T.744/99) – that no right to priority can be acknowledged for an invention that is regarded as novel over the disclosure of the corresponding priority document.

Subsequent decisions T.788/01, T.899/04, T.70/05 and T.971/08 also applied the principle that a generic disclosure cannot provide priority for a specific embodiment not disclosed in the priority document.

3.1.9 Inventions relating to nucleotide and amino acid sequences

In T.923/92 (OJ 1996, 564) claim 1, the subject-matter of which was defined by means of a reference to the amino acid sequence of Figure 5, was held not to be entitled to priority from earlier applications P1 and P2, in which that amino acid sequence was not disclosed. The sequence reported in Figure 5 was observed to differ from that of Figure 5 of P1 and P2 in respect of three amino acids. In the board's judgment, the skilled person would consider the reference to the amino acid sequence of a protein as a primary technical feature linked to the character and nature of the product. Evidence from the patentee was

restricted to the testing of a limited number of parameters and constituted at most proof of similarity, not of identity of the two polypeptides. These differed in one essential characteristic, i.e. the primary amino acid sequence.

In T.351/01 a polynucleotide which was the subject-matter of claim 1 was characterised both in structural terms and by its function. Priority documents I and II disclosed a polynucleotide having the same function as that of the polynucleotide of claim 1. However, its structure differed from that of the polynucleotide of claim 1 by five bases, all found in the part of the sequence which does not relate to the function i.e. outside of the coding region. The board, referring to the Enlarged Board's opinion G.2/98 (OJ 2001, 413), which had rejected an extensive or broad interpretation making a distinction between technical features which are related to the function and effect of the invention and technical features which are not, concluded that the subject-matter of claim 1 could not be seen as the same subject-matter as that disclosed in the priority documents. See also decision T.1213/05.

In T.30/02 the board held that the presence of two additional guanine residues in the nucleotide sequence disclosed in an application cited in this case under Art.54(3)EPC.1973 resulted in a different molecule that was not directly and unambiguously derivable from the earlier application from which priority was claimed. It was generally acknowledged in the case law of the boards of appeal that the nucleotide sequence of a nucleic acid represents an essential feature linked to the character and nature of the nucleic acid as such, and, where the nucleotide sequence is a coding sequence, also of the encoded protein (see T.923/92, OJ 1996, 564). The skilled person was aware of the fact that even a minimal modification of the nucleotide sequence may result in a different nucleic acid not only from the structural but also from the functional point of view. See also decision T.70/05.

In T.250/06, claim 1 of the second auxiliary request related to recombinant DNA molecules comprising a nucleotide sequence encoding a murine delta opioid receptor (DOR), characterised as hybridising under conditions of low stringency to the DNA sequence shown in Figure 5. Appellant II pointed out that Figure 5 of the priority document differed by the addition of seven interspersed bases in the 3' untranslated region. The board indicated that conditions of low stringency were developed for screening molecules which differ somewhat from the probe. It was fully expected that the group of molecules obtained by hybridisation to the DNA of Figure 5 of the priority document and of the patent in suit respectively would not be different.

3.2. Claiming in the subsequent application the invention disclosed in the previous application

The features of the invention disclosed in the priority application must also characterise the invention claimed in the subsequent application.

In T.1050/92 the disclosure of the invention in the earlier application provided an adequate basis for replacing the term "Flüssigkeitsabscheidezyklon" used in said application with the more general one "Luft/Flüssigkeits-Trenneinrichtung" in claim 1 of the European application.

In T 809/95, the opponents submitted that the "thin-walled" feature, which was disclosed in the first priority application as essential, was not contained in granted claim 1. The board was of the opinion that granted claim 1 was based on a "collapsible" plastic bottle "produced by the blow-moulding method" which had folds "to facilitate a reduction of volume upon the exertion of a pressure applied to the walls by hand". This description in itself **implied** that the bottle would have to be made from thin-walled plastic flexible enough to be collapsible by hand when empty, as required by independent claim 3 in the first priority application.

In T 515/00 the appellant had argued that features pertaining to hardware components relating to the printing process were no longer present in the claim and that there was no basis in the priority document for the deletion of these features. The board referred to G 2/98 (OJ 2001, 413, point 8.3 of the Reasons), in which the Enlarged Board had warned against an approach whereby a distinction was made between technical features which were related to the function and the effect of the invention and technical features which were not. Priority could not be acknowledged if a feature was modified or deleted, or a further feature was added. The board further noted that a claim passed the priority test if its subject-matter could be derived from the previous application **as a whole**. It followed that comparing the claim with the corresponding claim of the previous application was not a valid approach to performing the "priority test". The priority test was basically a disclosure test in which the skilled reader could use common general knowledge. If, in the description of the previous application, a distinction was made between features that were essential for the performance of the invention and features which were not, the latter could be deleted from the subject-matter of a claim without losing the right to priority. The omitted hardware components were nowhere presented as essential features in the priority document's description. The skilled reader would not have any reason to assume that they were essential merely because they were present in claim 1 of the priority document. The board concluded that the priority claimed was valid. This decision was followed in T 321/06.

According to the board in T 134/94, granted claim 1 was not entitled to priority. The priority document disclosed a **process** which worked under specific conditions indicated as features (a) to (d). Requirements (a) and (c) did not appear in granted claim 1; the invention defined by it was not the same as that defined in the priority document. According to the board, the respondent's position that the priority claim should be acknowledged whenever the disclosure of the priority document would destroy the novelty of the claims of the later application or patent ("novelty test") had no basis either in the EPC or in the EPO case law.

In T 552/94 the patent's claim 1 lacked four features which according to the priority document were indispensable for carrying out the invention. Citing T 134/94 and T 1082/93, the board found that without those features the invention according to claim 1 could not be the same as that described in the priority document, and the requirements of Art. 87(1) EPC 1973 were therefore not met.

In T 59/11 the board, assessing the requirement of the "same invention" according to the criteria of G 2/98 (OJ 2001, 413), concluded that there was no basis in the priority

document as a whole for the omission of features (a) to (d) from claim 1 in question. Rejecting arguments put forward by the proprietor, the board stated that the existence of a common problem to be solved in a claim under consideration and the document from which its priority was claimed was not decisive in finding a priority validly claimed or not. Nor was an identification of features which were not essential to solving this common problem and their deletion an accepted approach to justify a valid priority claim.

According to T 250/12, following G 2/98 (OJ 2001, 413, points 8.3 and 9 of the Reasons), the essentiality of a feature is not per se an appropriate criterion for judging the validity of a priority claim. Applying the standard laid down in G 2/98 for assessing the "same invention" requirement, the board noted that each of the independent claims of the first priority application contained the contested feature relating to the adjacent location of the third and second contact portions (or their corresponding terminals or apparatus side terminals). Moreover, the priority application as a whole did not provide any basis for considering the above feature as optional. Thus, a skilled person would immediately deduce from the first priority application that the feature formed part of the invention disclosed therein. Since this feature was deleted from the present independent claims, the subject-matter of those claims could not be clearly and unambiguously derived from the first priority application, and the claimed priority was not valid.

See also e.g. T 1890/09.

4. First application in respect of the invention

In principle, only the first application filed in a state party to the Paris Convention or a member of the WTO can form the basis of a priority right. In the EPC this is made clear in Art. 87(1) and (4) EPC.

Therefore, if apart from the application whose priority is being claimed in the subsequent European application, an earlier previous application was also filed, in order to check the validity of the priority claim it must be established whether the invention claimed in the subsequent application was already disclosed in the earlier previous application – see in this chapter II.D.4.1. Decisions also focusing on the identity of the applicants are dealt with in this chapter II.D.4.2.

In T 477/06 the board held first that since Euro-PCT application D8 had been deemed withdrawn due to non-payment of the designation fees (R. 23a EPC 1973), it was not prior art under Art. 54(3), (4) EPC 1973 for the application in suit. However, it had been filed by the same applicant and earlier than the priority application. In view of the fact that claimed subject-matter was anticipated by this earlier application, the priority application was not the first application within the terms of Art. 87(1) and (4) EPC 1973 (cf. Art. 8(2)(b) PCT), so that the priority claim was not valid. Hence, the application in suit enjoyed priority only from the date of filing and D8 was prior art under Art. 54(2) EPC 1973. See also T 1222/11 in chapter II.D.4.1. below.

For the case of a priority held invalid because it was **not** shown, for the purpose of Art. 87(4) EPC 1973, that at the date of filing of the application from which priority was

claimed, a previous first application filed by the applicant in respect of the same invention had been **withdrawn**, see **T 1056/01** (reported in chapter III.G.4.3.5).

4.1. Identity of invention

To establish whether the invention claimed in the subsequent European application was already disclosed in the earlier previous application, the same principles have to be applied as when establishing identity of invention between the application forming the basis of priority and the application claiming priority. The question is whether the person skilled in the art could derive the subject-matter of the claim of the subsequent application directly and unambiguously, using common general knowledge, from the earlier previous application or only from the later one (cf. **G 2/98**, OJ 2001, 413).

In **T 323/90** the board concluded that the alleged first application disclosed a different invention from that in the European application and the application from which priority had been claimed: the claimed process (for increasing the filling power of tobacco lamina filler) differed as regards both the moisture content of the tobacco for processing and the first step in the process.

In **T 400/90** priority had been claimed from a US application in respect of a European application concerning an electromagnetic flowmeter. According to the opponents, an earlier US application filed by the same applicant outside the priority period disclosed all the features contained in the European application with the exception of the use of saddle-shaped coils; however, the latter were already known and used frequently. In the board's opinion, the question to be answered was **whether the use of saddle-shaped coils had been disclosed** in the earlier US application, and **not whether it was obvious** to use such coils in place of the magnets disclosed in the earlier application. The board concluded that the inventions claimed in the US applications were different and priority had rightly been claimed from the later application because, according to the teaching of the earlier application, coils of any shape could be used, whereas according to the teaching of the priority document saddle-shaped coils had to be used.

In **T 184/84** the Japanese application from which priority was claimed in the European patent application but also an earlier Japanese application claimed a method of producing a single crystal of ferrite. The starting materials were defined differently in the two Japanese applications. The method disclosed in the later application and the European application was clearly more advantageous than that forming the subject-matter of the earlier one. The board held that the **significant differences in properties** were indicative of the presence of different materials and therefore found that the earlier Japanese application was not the first filing of the invention claimed in the European patent application. It based its finding on **T 205/83** (OJ 1985, 363), which stated that the novelty of products prepared using a modified process could be established by the fact that according to an empirical principle in chemistry, a product's properties were determined by its structure, so that differences in the properties of products indicated a structural modification.

The subject-matter of the patent in case T.107/96 contained the feature "angle of contact greater than 120°", which feature was disclosed in P2, the later of two previous US applications. In P2 a particular advantageous effect was also attributed to the large extent of the said "angle of contact". The earlier previous US application P1 was totally silent about the aforementioned feature "angle of contact" and its advantageous effect. However, the figures of P1 represented **diagrammatic** and schematic drawings. The board concluded that therefore, and in line with the established jurisprudence of the boards of appeal, they could not serve as a basis for determining the extent of a minimum "angle of contact" because dimensions obtained merely by measuring a diagrammatic representation of a document did not form part of the disclosure. Hence, the said feature "angle of contact greater than 120 °", was not disclosed in P1 but only in P2.

In T.449/04 the board referred to the Enlarged Board's narrow or strict interpretation in G.2/98 (OJ 2001, 413) of the concept of the "same invention" in Art. 87(1) EPC 1973 and concluded that the invention disclosed in the applicant's earlier application D1 was not the "same invention" as that disclosed in the priority application PR. With regard to a **comparative example** in D1, the composition of which fell within the elemental ranges claimed in the application-in-suit as well as in application PR, the board emphasised that the "same invention" considered in Art. 87(1) EPC 1973 did not encompass the comparative example(s), which were clearly and definitely **excluded** from the scope of the invention in D1. Having regard to the strict and narrow interpretation of the term "the same invention", this term was focused on what constituted the elements of the invention.

In T.1222/11 claim 1 had been amended to include six disclaimers for the purpose of restoring novelty over D4b, an earlier international (Euro-PCT) application of the same applicant, which had been published within the priority interval. The board found that the combination of features defined in positive terms in claim 1 (i.e. without any disclaimer) could not be distinguished from the disclosure of D4b and was not entitled to the claimed priority as far as it concerned the subject-matter already disclosed in D4b (Art. 87(1), (4) EPC). The compositions of D4b were therefore prior art under Art. 54(2) EPC. As the anticipatory disclosure of D4b was not an accidental anticipation (cf. G.1/03, OJ 2004, 413), the disclaimers based on it were not allowable under Art. 123(2) EPC. For further mention of this decision see chapter II.D.5.3.1.

In T.282/12 the board held that, for reasons of consistency, the rationale of decision G.1/15 (OJ 2017, A82 – concept of **partial priority**) must also apply in the context of deciding whether an application from which priority is claimed is the first application within the meaning of Art. 87(1) EPC. Indeed, just as a priority application and a patent claiming priority therefrom may partially relate to the same invention, the priority application and an earlier application filed by the same applicant may also do so. In that case, the priority application would be the first application in respect of only that part of the invention which is not the same as in the earlier application. Here, the board found that the earlier application filed by the applicant disclosed a range which was encompassed within the range of the priority document. Therefore, for that sub-range the priority document was not the first application. See also the summary of this decision in chapter II.D.5.3.3.

4.2. Identity of applicant

In T 5/05 the opposition division had concluded that neither of the two claimed priority applications qualified as the first application within the meaning of Art. 87(1) and (4) EPC 1973 on the grounds that two inventors and part of the subject-matter were the same as in an earlier previous application. As the filing date of that application was more than twelve months prior to the filing date of the contested patent and the application had been "made public", the same invention of the same inventors could no longer serve as a basis for claiming priority.

The board, however, stressed that priority could be based only on earlier applications filed by the applicant of the European application or by his predecessor in title. Moreover, only such applications could meet the further requirement, derivable from Art. 87(4) EPC 1973, that an application giving rise to the priority right had to be the first application by the applicant or by his predecessor in title in respect of the invention. The inventor was not relevant. Applications filed by various applicants figured alongside one another as state of the art within the meaning of Art. 54(2) or Art. 54(3) EPC 1973. The board also rejected the respondent's argument that the economic aspect was relevant to the requirements relating to priority and that the two wholly owned subsidiaries of the same parent company were not independent of each other in view of their association through the parent. Legal acts were in principle attributable to the (legal) person who had performed them. Exceptions to this needed a legal basis, which did not exist in the law relating to priority.

In T 788/05 the proprietor had been co-applicant in a previous European application D1 with an earlier priority date than that of the patent in suit. The appellant (opponent) argued that since the proprietor was also designated as applicant in D1, it had to be regarded as the "person" referred to in Art. 87(1) EPC 1973 regardless of the designation in D1 of a second applicant. Since, moreover, the invention was the same in both documents, D1 had to be considered as the first application. Therefore the priority claimed for the application in issue was not valid and D1 was prior art under Art. 54(2) EPC 1973.

The board held that the term "a person" in Art. 87(1) EPC 1973 (or "an applicant" in Art. 88(1) EPC 1973) implied that the applicant was the same for "the first application" (or "previous application" in Art. 88(1) EPC 1973) and for the later application for which a priority right was claimed. In the case of D1, the priority right belonged to the two applicants simultaneously, unless one decided to transfer his right to the other, who then became his successor in title and this before the filing of the later application. No evidence of such a transfer had been submitted. Since the application in issue was only filed by one applicant, D1 could not represent the "first application" within the meaning of Art. 87(1) EPC 1973. The priority date was valid and D1 represented state of the art under Art. 54(3) EPC 1973. The disclaimer introduced during the examination proceedings to restore the novelty of claim 1 vis-à-vis D1 was also accepted by the board.

In T 1933/12 the application underlying the patent was filed by the patent proprietors A1 and A2 and claimed the priority of D0, also filed by A1 and A2. Prior to D0, however, A2 had filed application D1, whose priority was not claimed but which undisputedly disclosed a gearbox drive in accordance with claim 1 in issue. The patent proprietors argued that D1

could not be considered the first application within the meaning of Art. 87 EPC. Since A2 was the sole applicant for D1 there was no identity of applicant with the patent in suit.

The board disagreed. T. 788/05, cited by the proprietors, concerned the opposite case, namely multiple applicants for the priority document but only one for the later European filing. For succession in title – as for first filings by multiple applicants but subsequent applications by only one or some of those applicants – it had to be shown that the priority right held jointly by the multiple earlier applicants had been transferred to the sole applicant or the group of applicants (T. 382/07). Art. 87(1) EPC did not exclude the (sole) applicant for the first filing sharing his priority right with a third party by filing a subsequent application jointly with the latter, but it did require that the applicant for the first filing, or his successor in title, be among the applicants for the subsequent, priority-claiming filing. In such a case, if there was only one additional applicant for the subsequent filing, there was no need to provide proof of the transfer of the priority right to him. In the case at issue, sole applicant A2 for D1 was also one of the applicants for the application leading to the patent, so D1 was the first application (Art. 87(1) EPC). The fact that D0 and D1 designated different inventors made no difference. Some of D0's inventors were also designated as inventors in D1, so it could not be assumed that the two applications derived from two different inventive acts. Most importantly, identity of inventor was not relevant for Art. 87 EPC, which, for the purpose of claiming a right of priority, referred to the applicant (T. 5/05).

5. Partial and multiple priorities

In cases where partial or multiple priorities can be validly claimed, the subject-matters of the subsequent application have two or more operative priority dates. In the case of a **partial priority** that part of the subsequent application's subject-matters disclosed in the previous application has the priority date of the previous application; for the remaining part the date of filing of the subsequent application applies. With **multiple priorities**, the priority of two or more previous applications is claimed. In this case, claims in the subsequent application have the priority date of the previous application in which the subject-matter subsequently claimed was disclosed (see also chapter II.D.5.2. below). Multiple priorities may be claimed for any one claim (Art. 88(2), second sentence, EPC), as long as several subject-matters are included (see also chapter II.D.5.3. below, and summary of G. 1/15, OJ 2017, A82, in chapter II.D.5.3.2).

5.1. Publications during the priority interval – effect on elements of the European patent application not entitled to priority

As noted by the EPO President in the reasons for the referral in G 3/93 (OJ 1995, 18), on the one hand, it frequently occurs that in subsequent filings new elements and information are added in respect of prior applications of the same applicant and, on the other hand, inventors are often eager to publish the results of their research as soon as possible.

In its ensuing opinion, the Enlarged Board stated that a document published during the priority interval, the technical contents of which correspond to that of the priority document, constitutes prior art citable under Art. 54(2) EPC 1973 against a European patent

application claiming that priority, to the extent that such priority is not validly claimed. This also applies if a claim to priority is invalid due to the fact that the priority document and the subsequent European application do not concern the same invention because the European application claims subject-matter not disclosed in the priority document. The Enlarged Board emphasised that the existence of a right of priority depends, *inter alia*, on the fulfilment of the requirement that the European patent application claiming the right of priority from an earlier application must be "in respect of the same invention" disclosed in the earlier application. Where priority is claimed but cannot be allowed because the essential condition precedent, that the inventions are the same, is not met, there is no right to priority. Consequently, any publication of the contents of a priority document during the priority interval constitutes prior art citable against **elements** of the European application which are **not entitled to priority**. See the example in G 9/93; see also e.g. T 594/90, T 961/90, as well as the discussion in T 301/87, OJ 1990, 335.

T 131/99 stressed that in this regard there is no difference between dependent and independent claims (see also T 85/87, and T 127/92, which is summarised in the next section).

5.2. Different priorities for different parts of a European patent application

According to Art. 88(3) EPC, if one or more priorities are claimed in respect of a European patent application, the right of priority shall cover only those elements of the European patent application which are included in the application or applications whose priority is claimed. Since, pursuant to Art. 84 EPC, the claims of the European patent application define the matter for which protection is sought and, hence, determine the matter for which priority may be claimed, the term "elements of the invention", referred to in Art. 88(4) EPC, and the term "elements of the European patent application", referred to in Art. 88(3) EPC, are to be considered synonymous. Both an "element of the invention" and an "element of the European patent application" actually constitute subject-matter as defined in a claim of the European patent application (see G 2/98, OJ 2001, 413).

In T 828/93 the board stated that it followed from Art. 88(3) EPC 1973 that different priorities (including no priority, i.e. only the date of the European application) could be conferred on different parts of a European application. It was sufficient to check whether the subject-matter to be compared with the prior art, i.e. the **subject-matter of the independent patent claims**, corresponded to the disclosure of the documents of the priority application as a whole (see Art. 88(4) EPC 1973). Only one (or, as the case may be, no) priority could be conferred on each claimed **subject-matter as a whole**, in so far as the subject-matter was defined by the totality of the given elements. This subject-matter as a whole represented the invention, which either corresponded to the disclosure of a priority application or not.

In T 127/92 priority had been claimed from two German utility models (D1 and D2), which were published during the priority interval. The board held that priority had been validly claimed from D1 for claim 1 and several dependent claims. However, it found that other **sub-claims**, which also contained **elements not disclosed in D1**, could not claim partial priority from D1 for the subject-matter of claim 1 contained in them. On the basis of the

principles developed in G 3/93 (OJ 1995, 18), the board concluded that D1 and D2 formed part of the state of the art in respect of these claims and that, consequently, their subject-matter did not involve an inventive step. The patent proprietor therefore deleted them.

See also T 85/87, T 594/90, T 961/90.

5.3. Multiple priorities or partial priority for one claim

Art. 88(2), second sentence, EPC provides that, where appropriate, multiple priorities may be claimed for any one claim. The Enlarged Board of Appeal considered the application of this provision in G 2/98 (OJ 2001, 413) and in G 1/15 (OJ 2017, A82). Respective summaries are given below.

The following earlier decisions of technical boards are also of interest.

In T 828/93 (see also chapter II.D.5.2. above) the board confirmed that the possibility mentioned in Art. 88(2), EPC 1973 of multiple priorities for any one patent claim related only to instances where, unlike in the case at issue, the claim contained **alternatives** and could therefore be split into **several subject-matters**.

In T 620/94 it became apparent that granted claim 1 covered two alternatives A and B of the invention. Only alternative B was disclosed in the priority document; alternative A was contained only in the subsequent European application. Prior art published during the priority interval rendered obvious alternative A. The patent could thus only be maintained in amended form, i.e. limited to alternative B.

In T 441/93 the patent related to a process for preparing a strain of the yeast *Kluyveromyces*, which comprised transforming *Kluyveromyces* yeast cells. The priority document disclosed a process for the transformation of protoplasts of such yeast. The board concluded that the claims could be divided into two groups: Group A, enjoying priority rights from the previous application and comprising claim 1 in so far as directed to a process for the transformation of *Kluyveromyces* protoplasts, and the related further claims; and Group B, only enjoying the priority of the subsequent European application, and comprising claim 1 in so far as not directed to a process for the transformation of protoplasts, and the related further claims. Consequently, a scientific article published in the priority interval was held to be prior art only as regards the parts of the claimed subject-matter not disclosed in the priority document. See also T 395/95.

In G 2/98 (OJ 2001, 413) the Enlarged Board of Appeal analysed the legislative intention behind Art. 88(2), second sentence, EPC 1973 and concluded that a distinction has to be drawn between the two following cases. The legislator did not want several priorities to be claimable for the **"AND" claim** (e.g. a claim to features A and B, with the first priority document disclosing claim feature A alone and only the second priority document disclosing claim feature B). With regard to the **"OR" claim**, the Enlarged Board drew the following conclusion from the historical documentation relating to the EPC 1973: where a first priority document disclosed a feature A, and a second priority document disclosed a feature B for use as an alternative to feature A, then a claim to A or B could enjoy the first

priority for part A of the claim and the second priority for part B of the claim. It was further suggested that these two priorities might also be claimed for a claim directed to C, if the **feature C**, either in the form of a generic term or formula, or otherwise, **encompassed feature A as well as feature B**. The use of a generic term or formula in a claim for which multiple priorities were claimed in accordance with Art. 88(2), second sentence, EPC 1973 was perfectly acceptable under Art. 87(1) and 88(3) EPC 1973, provided that it gave rise to the claiming of a **limited number of clearly defined alternative subject-matters** (see point 6.7 of the Reasons.)

5.3.1 Development of the case law after G 2/98 in respect of generically formulated "OR" claims

In the period that followed G 2/98 (OJ 2001, 413), the above-mentioned proviso of the Enlarged Board in respect of generic "OR" claims gave rise to divergences in the jurisprudence of the boards. These led to a further ruling by the Enlarged Board in G 1/15 (OJ 2017, A82); see also chapter II.D.5.3.2 below).

In some of those cases, subject-matter disclosed in the priority document and falling within the generically formulated claim of the subsequent European application was denied (partial) priority because the terms of the proviso were found not to be met. Such approach could sometimes lead to a "collision" under Art. 54(3) EPC with another member of the same European patent family (particularly in situations involving what is sometimes referred to as a "toxic priority" or "poisonous divisional" – see also T 557/13 of 17 July 2015, OJ 2016, A87, summarised in the next section). In G 1/15 (OJ 2017, A82), the Enlarged Board observed that in a number of decisions the words of the proviso had been understood as a further test to be complied with for a claim to partial priority to be accepted, an interpretation which the Enlarged Board rejected. Accordingly, G 1/15 has overruled the approach taken in T 1127/00, T 1443/05, T 1877/08, T 476/09, and other decisions mentioned in G 1/15, point 2.2 of the Reasons.

However, other decisions issued after G 2/98 acknowledged partial priority in comparable circumstances.

Thus, in T 665/00, the board found that the subject-matter of an alleged public prior use within the priority interval was described in the priority document and also fell within the scope of the claims of the disputed patent, but that the priority document did not necessarily describe all the subject-matters claimed. Referring to Art. 88(3) EPC 1973 and G 2/98 (OJ 2001, 413), the board held that different elements of a patent application could enjoy different priority dates and that this was also applicable to a single claim encompassing alternatives and being, thus, separable into a plurality of subject-matters. Of the different alternatives contained in claim 10 (relating to a powder containing hollow microspheres the specific mass of which was described by the generic term "less than 0.1 g/cm³"), the non-compacted powders containing "Expancel DE" microspheres were covered by the claimed date of priority. The claimed prior use, which came after the priority date and involved a product containing the same "Expancel DE" microspheres, could therefore not be novelty-destroying. See also T 135/01.

The meaning of the proviso of G 2/98 in relation to the "OR" claim situation was the subject of extensive obiter remarks in T 1222/11. According to the board, the condition "provided that it gives rise to the claiming of a limited number of clearly defined alternative subject-matters" should be given a different meaning from that attributed to it in T 1877/08, T 476/09, T 1443/05 and T 1127/00. This condition could not be meant to set out the manner in which the subject-matter of the "OR" claim must be defined. This would, at least in relation to generic terms, be at variance with the disclosure test based on the principle of an unambiguous and direct disclosure (cf. G 3/89, OJ 1993, 117). For the purpose of the assessment required by Art. 88(3) EPC, the board considered that the wording of the above condition referred to the ability to conceptually identify, by comparison of the claimed subject-matter of the "OR" claim with the disclosure of the multiple priority documents, a limited number of clearly defined alternative subject-matters to which the multiple rights of priority claimed could be attributed or not (cf. examples in the Memorandum drawn up by FICPI (M/48/I, Section C) for the Munich Diplomatic Conference in 1973, as cited in G 2/98).

T 571/10 expressly applied the approach of T 1222/11. The application in suit, which concerned a pharmaceutical composition, and D9, also a European application, shared the same filing date and claimed priority from the same earlier national application. By comparing the generic subject-matter of claim 1 in issue with the priority document, the board identified two clearly defined alternative subject-matters (a) and (b) as being encompassed by the claim, but not spelt out in it. Only alternative (a) was fully disclosed in the priority document and therefore enjoyed the claimed priority. D9 could belong to the state of the art under Art. 54(3) EPC only in so far as the priority of the application in suit was not validly claimed while the priority of D9 was. For alternative (a) of claim 1, this was not the case, since D9 had no valid earlier effective date. For alternative (b) of claim 1, D9 was state of the art under Art. 54(3) EPC only for the subject-matter for which the priority claimed for D9 was valid, which was that of alternative (a). This subject-matter was not novelty-destroying for the subject-matter of alternative (b) of claim 1, as it had no overlap with the latter.

The decision headnote states: "In a case in which a single priority is claimed for a given application and a number of features of a claim of said application are generalisations of specific features disclosed in the priority document, a partial priority is to be acknowledged, as long as it is possible to conceptually identify, by a comparison of the claimed subject-matter with the disclosure of the priority document, a limited number of clearly defined alternative subject-matters, including among the alternatives the specific embodiments which are directly and unambiguously derivable from the priority document. In order for this condition to be met, it is not necessary that the clearly defined alternative subject-matters are spelt out as such in the application, nor that the word "or" actually occurs. This condition extends to the case of multiple priorities. In that case, a comparison with the disclosure of each of the priority documents is necessary and for each of the clearly defined alternative subject-matters the earliest priority from which the alternative subject-matter is directly and unambiguously derivable is acknowledged."

5.3.2 Referral case G 1/15 ("Partial priority")

The patent in suit in case T 557/13 of 17 July 2015 (OJ 2016, A87) had been granted on a divisional application. The opposition division concluded that an intermediate generalisation in granted claim 1 with respect to the disclosure of priority document D16 did not give rise to the claiming of a limited number of clearly defined alternative subject-matters (cf. G 2/98, OJ 2001, 413). Hence, although the patent met the requirements of Art. 76(1) EPC, the subject-matter of claim 1 did not enjoy the priority date of parent application D1. D1 was thus considered to be state of the art under Art. 54(3) EPC, and claim 1 to lack novelty in view of the use of the product of example 1 disclosed identically in D16 and D1. For the board, the question to be resolved was whether claim 1 enjoyed partial priority to the extent that the use of the product of example 1 as disclosed in D16 was encompassed by the more generic definition of claim 1, rather than being spelt out in it. In view of the differing approaches in previous board decisions, the board decided to seek clarification from the Enlarged Board of Appeal of the law on partial priority for generic "OR" claims and on the proper interpretation of the proviso of G 2/98 (point 6.7 of the Reasons).

In G 1/15 (OJ 2017, A82) the Enlarged Board of Appeal ruled that under the EPC, entitlement to partial priority may not be refused for a claim encompassing alternative subject-matter by virtue of one or more generic expressions or otherwise (generic "OR" claim) provided that said alternative subject-matter has been disclosed for the first time, directly, or at least implicitly, unambiguously and in an enabling manner in the priority document. No other substantive conditions or limitations apply in this respect. The Enlarged Board set out its interpretation of Art. 88(2) and (3) EPC. If a claim in the later application was broader than an element disclosed in the priority document, then priority could be claimed for such element. It did not matter whether partial priority was claimed for one element in one priority document only, for a plurality of elements disclosed in one priority document (first situation addressed in Art. 88(3) EPC), for a plurality of elements disclosed in more than one priority document (second situation addressed in Art. 88(3) EPC) or for a plurality of elements disclosed in a plurality of priority documents (situation addressed in Art. 88(2), second sentence, EPC). It was also of no relevance whether one claim encompassed only one element disclosed in a priority document or a plurality of elements disclosed in one or more priority documents. The Enlarged Board considered this interpretation to be confirmed by FICPI Memorandum C (M/48/I) of the *travaux préparatoires* to the EPC 1973, which could be said to express its intent (G 2/98, point 6.4 of the Reasons; see also Minutes of the Munich Diplomatic Conference of 1973, M/PR/I, "Article 86 (88) Claiming Priority", points 308 to 317), and by the Paris Convention. Thus, the EPC did not contain other requirements for recognising the right of priority beyond the same invention, whether for simple, multiple or partial priority, the last being regarded as a sub-group of multiple priorities. As a consequence, the proviso of G 2/98 could not be construed as implying a further limitation of the right of priority.

In assessing whether a subject-matter within a generic "OR" claim could enjoy partial priority, the first step was to determine the subject-matter disclosed in the priority document that was relevant, i.e. relevant in respect of prior art disclosed in the priority interval. This was to be done in accordance with the disclosure test laid down in the

conclusion of G 2/98 and on the basis of explanations put forward by the applicant or patent proprietor to support his claim to priority, in order to show what the skilled person would have been able to derive from the priority document. The next step was to examine whether this subject-matter was encompassed by the claim of the application or patent claiming said priority. If the answer was yes, the claim was de facto conceptually divided into two parts, the first corresponding to the invention disclosed directly and unambiguously in the priority document, the second being the remaining part of the subsequent generic "OR"-claim not enjoying this priority but itself giving rise to a right to priority, as laid down in Art. 88(3) EPC. This also corresponded to the scheme described in the Memorandum. The task of determining the relevant disclosure of the priority document taken as a whole, and whether that subject-matter was encompassed by the claim in the subsequent application, was common practice in the EPO and among practitioners of the European patent system and as such should not pose any additional difficulty. Nor did it create uncertainty for third parties. The decisions reached in T 665/00, T 135/01, T 571/10 and T 1222/11 showed that it could be carried out without any need for additional tests or steps.

5.3.3 Application of G 1/15 in the jurisprudence of the boards

In case T 260/14 the opposition division had denied priority and found that claim 1 lacked novelty pursuant to Art. 54(3) EPC in view of a working example disclosed in the priority document (D5) itself, which example was also disclosed in the description of the patent in suit. (D5 had been dealt with as a case of "toxic priority".) In accordance with G 1/15 (OJ 2017, A82), the board first identified the working example as being relevant subject-matter disclosed in the priority document (cf. G 2/98, OJ 2001, 413). It then analysed whether claim 1 encompassed the working example, and whether that example was alternative subject-matter by virtue of a generic "OR" claim, by comparing the ambit of the claim with the content of the priority document. The claim was to a dental impression material comprising a base paste and a catalyst paste. Both pastes were described using generic features such as "polyethers" and "copolyether of ethyleneoxide". The working example was one specific embodiment of the claim. Multiple alternative working examples would be possible, with different variants falling within the generic features of the claim. The example was thus alternative subject-matter by virtue of a generic "OR" claim which fell within the ambit of claim 1. Hence, the part of claim 1 concerning that example was entitled to partial priority.

Further decisions applying the approach of G 1/15 are T 1526/12 (hair care composition), T 557/13 of 28 July 2017 (use of a cold flow improver), T 2466/13 (insulation panel), T 1399/13 (polymerisation process), T 88/14 (low-fat confectionary product), T 1519/15 (sensing circuit comprising sensing capacitors).

In T 282/12 the board held that, for reasons of consistency, the rationale of decision G 1/15 (OJ 2017, A82) must also apply in the context of deciding whether an application from which priority is claimed is the **first application** within the meaning of Art. 87(1) EPC (see more detailed summary of this aspect of the decision in chapter II.D.4.1. above). The board also cautioned in this context against assessing priority by performing a test under Art. 123(2) EPC, which approach had led the opposition division to find that D1 was the

first application. The assessment of priority and of the requirement of Art. 123(2) EPC were both based on the concept of disclosure. However, applying a test under Art. 123(2) EPC could lead to wrong conclusions in certain circumstances because the concept of "partial" validity of an amendment does not exist, whereas "partial priority" does. Relating this to the facts of the case (gap width of coated tablet), the board agreed that amending a range from 5% to 33% (i.e. the range in claim 1 and in the priority document D1) to 3% to 33% (i.e. the range in the proprietor's earlier application D22) would result in the addition of subject-matter. However, both of these encompassed an identical part, i.e. the sub-range 5% to 33%, which defined alternative dosage forms that did not change their identity, whether they were claimed as such or as part of a broader group of compositions, including other compositions with a gap width outside the range 5% to 33%. Thus, in the present case, the mere application of an assessment pursuant to Art. 123(2) EPC to the assessment of the validity of the priority claim did not allow the conclusion that D1 and D22 related in part to the same invention and therefore that the priority was not valid over the whole scope of claim 1.

E. Amendments

1.	Article 123(2) EPC – added subject-matter	432
1.1.	General principles	432
1.2.	Content of the application as filed: Parts of the application which determine the disclosure of the invention	433
1.2.1	Description, claims and drawings	433
1.2.2	Abstracts, titles, priority documents, parallel applications	434
1.2.3	Language issues	434
1.2.4	Cross-references to other documents	435
1.3.	Standard for assessing compliance with Article 123(2) EPC	436
1.3.1	Gold standard: directly and unambiguously derivable	436
1.3.2	Standpoint of the skilled person	436
1.3.3	Implicit disclosure	438
1.3.4	Subject-matter not implicitly disclosed	439
a)	Subject-matter merely rendered obvious by the content of the application	439
b)	Results of reflection and imagination of the skilled person	440
c)	General open-ended statement in description	440
1.3.5	Conditions insufficient for compliance with Article 123(2) EPC	441
a)	Consistency with original disclosure	441
b)	Reasonable plausibility of the included feature	441
1.3.6	Criteria not relevant for assessing compliance with Article 123(2) EPC	441
a)	Obviousness	441
b)	Indication in the description that subject-matter is known to the skilled person	442
c)	Enabling disclosure	442
d)	Limitation of scope of the original claim	442
1.3.7	Novelty test	443
1.3.8	Non-technical subject-matter	444
1.3.9	Claim interpretation when assessing compliance with Article 123(2) EPC	444
1.4.	Removal or replacement of features from a claim	446
1.4.1	Broadening of claim – permissible within the limits of the original disclosure	446
1.4.2	Basis in the application as originally filed – gold standard	446
1.4.3	Omission of a feature presented as essential	447
1.4.4	The essentiality or three-point test	448
a)	Decisions setting out and applying the test	448
b)	Mere aid in assessing the allowability of amendments	449
c)	Decisions criticising the three-point test	449
1.4.5	Removal of set of features	450
1.4.6	Removal of a feature indicating the intended purpose	450
1.4.7	Elimination of contradictions and inconsistencies	451
1.5.	Ranges of parameters – setting upper and lower limits	452
1.5.1	Forming a range by combination of end-points of disclosed ranges	452
1.5.2	Forming a range with isolated value taken from example	455
1.5.3	Setting new end-point with not expressly disclosed value	457

1.6.	Combination of features pertaining to separate embodiments or lists	459
1.6.1	Combination of features pertaining to separate embodiments: application as filed is not a "reservoir"	459
1.6.2	Selection from two lists – singling out a combination of features	460
1.6.3	Deletion of elements from lists – shrinking the lists without singling out a combination of features	465
1.7.	Disclaimer	467
1.7.1	Definition	467
1.7.2	Standards for examining disclosed and undisclosed disclaimers	467
a)	Principles established in G 1/03 and G 2/03 for undisclosed disclaimers	468
b)	Principles established in G 2/10 for disclosed disclaimers	469
c)	Explanations in G 1/16	470
1.7.3	Decisions applying the criteria established by the Enlarged Board in G 1/03 and G 1/16	472
a)	Accidental anticipation	472
b)	Drafting of disclaimers – disclaimer shall not remove more than is necessary	474
c)	Drafting of disclaimers – disclaimer shall not remove less than is necessary	476
d)	Drafting of disclaimers – delimitation against any potential prior art	476
e)	Drafting of disclaimers – clarity	476
f)	Undisclosed disclaimer must not be related to the teaching of the invention	478
g)	Negative features	480
1.7.4	Decisions applying the criteria established by the Enlarged Board in G 1/10 – remaining subject-matter test	480
1.7.5	Applicability of the decisions of the Enlarged Board to cases already pending	480
1.8.	Generalisations	480
1.8.1	Replacing specific feature with more general term – no inclusion of undisclosed equivalents	480
1.8.2	Generalisation and claim category	482
1.8.3	No generalisation of an effect obtained for particular embodiments	482
1.8.4	Amendments to preamble of claim by substituting general term for specific term	482
1.9.	Intermediate generalisations	482
1.10.	Specific derived from generic	487
1.10.1	Specific term or embodiment derived from generic disclosure	487
1.10.2	Component of entity derived from entity	488
1.10.3	Restricting a generic definition of a substituent to a specific (individual) one	488
1.10.4	Multiple arbitrary selection	489
1.11.	Additions	489
1.11.1	Addition to the claim of a feature taken from drawings	489
1.11.2	Addition to the claim of an isolated feature taken from description	489
1.11.3	Addition to the claim of features originally presented as prior art	489

1.11.4	Addition to the claim of features previously described as non-essential	490
1.11.5	Adding prior art citations to the description	490
1.11.6	Addition of advantages and effects to the description	491
1.11.7	Addition/change of claim category	491
1.11.8	Insertion of an ambiguous feature in the claim	492
1.11.9	Characteristic described for intermediate product added to the claimed end product	492
1.12	Errors in the disclosure	492
1.12.1	Calculation errors	492
1.12.2	Incorrect structural formula	493
1.12.3	Amendment based on erroneous figure in the disclosure	493
1.12.4	Incorrect information in earlier application as filed but correct information directly and unambiguously derivable	493
1.13	Disclosure in drawings	494
1.14	Amending the description	497
1.14.1	Amendment to provide support for unsupported claim	497
1.14.2	Impact on the claimed subject-matter	497
1.14.3	Adding prior art citations to the description	497
1.14.4	Shift in the interpretation of a claim by amendment of the description	497
1.14.5	Shift in the information provided by the examples after amendment of claims	498
1.14.6	Reformulation of the technical problem	498
1.14.7	Replacement of complete description and drawings	499
1.14.8	Deletion from the description of expressions making features optional	499
1.15	"Comprises", "consists of", "consists essentially of", "contains"	499
1.16	Different sets of claims for different contracting states	501
2	Article 123(3) EPC – extension of the protection conferred	501
2.1	Purpose of Article 123(3) EPC	502
2.2	Totality of claims	502
2.3	Extent of protection	502
2.3.1	Article 123(3) EPC and Article 69 EPC	502
2.3.2	Cut-off point	505
2.3.3	General claim interpretation	507
2.4	Deletions and replacements	508
2.4.1	Deletion of a limiting feature in a claim	508
2.4.2	Deletion of important feature from description where claim remains unchanged	509
2.4.3	Deletion of examples for a general feature in a claim	509
2.4.4	Deletion of disclaimer referring to trade names	509
2.4.5	Deletion of a drawing	509
2.4.6	Deletion of feature in a claim mentioned "in particular"	510
2.4.7	Deletion of a "preferred" feature in a claim	510
2.4.8	Reducing scope of claim by adding embodiments to a negative feature	510
2.4.9	Replacement of a restrictive term by a less restrictive term	511
2.4.10	Replacement of an inaccurate technical statement in a claim	511
2.4.11	Replacement of "cell of a plant" by "plant"	512

2.4.12	Replacement of substance by device containing substance or substance with mechanical device	512
2.4.13	Replacement by aliud	513
2.4.14	Narrowing down a generic class or list of chemical compounds; open claims ("comprising"); sequential drafting ("cascade")	514
2.4.15	Replacement of drawings	515
2.5.	Transposition of features within claims	515
2.6.	Change of claim category	516
2.6.1	From product claim to a claim directed to the use of the product	517
a)	Different categories of use claims	517
b)	From product claim to a claim directed to using a product to achieve an effect	518
c)	From product claim to a claim directed to using a product for producing another product – Article 64(2) EPC	518
2.6.2	From product or product-by-process claim to a claim directed to a process for manufacturing/preparing the product, and vice versa	519
2.6.3	From a product claim to a product-by-process claim	520
2.6.4	From method claim for treating the human body by therapy to product claim	520
2.6.5	From use claim to process claim, and vice versa	521
2.6.6	From use claim to Swiss-type claim	522
2.6.7	From Swiss-type claim to purpose related product claim under Article 54(5) EPC	522
3.	Relationship between Article 123(2) and Article 123(3) EPC	523
3.1.	Inescapable trap	523
3.2.	Attempts to resolve the conflict	524
3.3.	Addition to the claim of an undisclosed feature limiting protection conferred, without providing a technical contribution	526
4.	Correction of errors in the description, claims and drawings – Rule 139 EPC	530
4.1.	Relationship of Rule 139 EPC with Article 123(2) and (3) EPC	530
4.2.	Obviousness of the error and the correction	531
4.2.1	Documents to be taken into account for the assessment of obvious error and correction	531
4.2.2	Obvious error – incorrect information objectively recognisable	531
4.2.3	Obvious correction – immediately evident that nothing else would have been intended than what is offered as the correction	533
4.3.	Correction of errors in the description, claims and drawings after grant, and in opposition proceedings	535
5.	Evidence and standard of proof for allowing amendments and corrections	536

This chapter concerns the allowability of amendments under Art. 123(2) and (3) EPC, as well as corrections of errors in the parts of a patent application or of a patent relating to the disclosure (the description, claims and drawings) under R. 139 EPC. Other aspects related to amendments are dealt with elsewhere; see for example chapters II.D.3.1.2 in the context of Art. 87(1) EPC; II.F. "Divisional applications", in particular II.F.2.2. "Amendments to divisional applications"; III.1.3.1. "Party's responsibility to define subject-matter by filing appropriate requests"; III.L. "Correction of errors in decisions"; IV.B.1.1., 2.6., 3.3., 3.4., 3.6., 3.7., 5. for the admissibility of amendments during the "Examination procedure"; IV.C.5. "Amendments in opposition proceedings"; V.A.4. "New submissions on appeal".

1. Article 123(2) EPC – added subject-matter

1.1. General principles

According to Art. 123(2) EPC the European patent application or the European patent may not be amended in such a way that it contains subject-matter which extends beyond the content of the application as filed. The revision of the EPC has introduced a purely editorial change to the wording of Art. 123(2) EPC to bring it into line with Art. 123(1) EPC.

The concept of "content of the application as filed" relates to the parts of the European patent application which determine the disclosure of the invention, namely the description, the claims and the drawings (G 3/89, OJ 1993, 117, and G 11/91, OJ 1993, 125). See in this chapter at II.E.1.2. "Content of the application as filed: Parts of the application which determine the disclosure of the invention" below.

The **underlying idea** of Art. 123(2) EPC is that an applicant should not be allowed to improve his position by adding subject-matter not disclosed in the application as filed, which would give him an **unwarranted advantage** and could be damaging to the legal security of third parties relying on the content of the original application (see G 1/93, OJ 1994, 541). The public may not be confronted with an extent of protection, which could not have been established by a skilled person having studied the whole content of the technical disclosure of the originally filed patent application (T 157/90, see also T 187/91).

The **"gold standard"** (G 2/10, OJ 2012, 376) for assessing compliance with Art. 123(2) EPC is the following: any amendment to the parts of a European patent application or of a European patent relating to the disclosure (the description, claims and drawings) is subject to the mandatory prohibition on extension laid down in Art. 123(2) EPC and can therefore, irrespective of the context of the amendment made, only be made within the limits of what a skilled person would derive directly and unambiguously, using common general knowledge, and seen objectively and relative to the date of filing, from the whole of these documents as filed (G 3/89, OJ 1993, 117; G 11/91, OJ 1993, 125). After the amendment the skilled person may not be presented with new technical information (G 2/10; see however G 1/16 for undisclosed disclaimers). For details, see in this chapter II.E.1.3. "Standard for assessing compliance with Article 123(2) EPC" further below; for more details on G 1/16, OJ 2018, A70, see "II.E.1.7. Disclaimers" below.

Art. 123(2) EPC **applies to all amendments** to the patent application or patent. These include corrections of the description, claims or drawings under R. 139, second sentence, EPC (for details, see in this chapter II.E.4. "Correction of errors in the description, claims and drawings").

The Enlarged Board has stressed the importance of applying a **uniform concept of disclosure** (with reference to Art. 54, 87 and 123 EPC; see G 2/10, OJ 2012, 376, point 4.6 of the Reasons, citing G 1/03, OJ 2012, 436; see also G 1/15, OJ 2017, A82, with reference to G 2/98, OJ 2001, 413). See also e.g. T 330/14.

In the case of divisional applications, the same principles are to be applied for determining whether subject-matter extends beyond the content of the earlier application as filed (G 1/05, OJ 2008, 271, point 5.1 of the Reasons). The decisions dealing with such cases are therefore also reported in this chapter.

The same principles also apply to the ground for opposition under Art. 100(c) EPC.

The ground for opposition under Art. 100(c) EPC and the corresponding requirement of Art. 123(2) EPC in regard to any amendment carried out on the patent in the course of the opposition and opposition appeal proceedings are of equal fundamental importance compared to other requirements, such as e.g. novelty, inventive step or sufficiency of disclosure, when it comes to deciding whether a patent can be maintained; also, extension of subject-matter in the terms of Art. 123(2) EPC was not a question of "form" of the patent, which might fall under the heading of a "formal requirement", but a substantive one (T 2171/14).

1.2. Content of the application as filed: Parts of the application which determine the disclosure of the invention

1.2.1 Description, claims and drawings

Regarding the concept of the content of the application as filed, G 3/89 (OJ 1993, 117) and G 11/91 (OJ 1993, 125) laid down that it related to the parts of the European patent application which determined the disclosure of the invention, namely the description, the claims and the drawings. Note however that since the revision of the EPC, when determining the application documents "as filed", account has to be taken of R. 40 and 56(3) EPC.

Amendments can only be made within the limits of what a skilled person would derive from the **whole** of these documents as filed (G 2/10, OJ 2012, 376). In T 676/90 the board considered that the content of an application was defined not only by features mentioned or shown therein but also by their relationship to each other. Accordingly, it found that a figure could never be interpreted in isolation from the overall content of the application but only in that general context.

In T 1544/08 the board held that, if the drawings of the originally filed application were in colour, it was these figures which must be used as the basis for determining whether

subsequently filed figures contained added subject-matter within the meaning of Art. 123(2) EPC.

1.2.2 Abstracts, titles, priority documents, parallel applications

In T 246/86 (OJ 1989, 199) the board decided that as the **abstract** was intended solely for documentation purposes and did not form part of the disclosure of the invention, it could not be used to interpret the content of the application for the purposes of Art. 123(2) EPC 1973 (confirmed in T 735/03, T 606/06, see also G 3/89, OJ 1993, 117, G 11/91, OJ 1993, 125 and T 735/03). The same applies to the **title** on the cover sheet (T 1437/07).

For the purpose of Art. 123(2) EPC, "the content of the application as filed" also does not include any **priority documents**, even if they are filed on the same day as the European patent application (see T 260/85, OJ 1989, 105; G 3/89, OJ 1993, 117; G 11/91, OJ 1993, 125); the same is true for parallel applications (see, e.g. J 16/13, T 1197/13, concerning a German utility model application claiming the same priority). Concerning priority documents, see however R 56(3) EPC.

1.2.3 Language issues

Before the EPC 2000, a European patent application could only be filed in one of the official languages of the EPO (Art. 14(1) EPC 1973) or, by persons benefiting from the "language privilege", in an "admissible non-EPO language" with a translation into one of the official languages to be filed (Art. 14(2) EPC 1973). In line with Art. 5 PLT, Art. 14(2) EPC now provides that the application may be filed in one of the official languages or in "any other language". In the latter case a translation has to be provided (see chapter III.F.1, "Language of filing and date of filing of a European patent application").

In T 382/94 (OJ 1998, 24) the board held that if the drawings were filed in full on the date of filing, they formed part of the application as filed, even if they contained text matter in an official language other than the language of the proceedings. The amendment of the application, based on the English-language text matter in the drawings as filed, did not represent an infringement of Art. 123(2) EPC 1973.

In T 605/93 the board held that where the application documents of the European application as filed were a translation of the international application as it was filed, the content of the "application as filed" was that of the **international application as it was filed** (see also T 1402/09, T 923/13 and T 1981/15). In all normal circumstances, it ought however to be assumed that the published European application was identical in content with the published international application (T 605/93, see also T 549/09). Only when there were reasonable grounds to doubt this presumption in a particular case was further investigation and, where necessary, the production of evidence required (T 1010/07, T 1981/15).

In T 287/98 the original application in Dutch contained the word "schroot", which means scrap metal, as substantiated by the copies of various dictionaries provided by the appellant. According to the board, this word was not correctly translated into English by the word "scrap" and nothing other than "scrap metal" was meant in the application as originally filed. The board decided that the replacement of the word "scrap" by "scrap metal" was allowable under Art. 123(2) EPC 1973 since Art. 70(2) EPC 1973 provided that in a case referred to in Art. 14(2) EPC 1973, i.e. in which the European patent application was filed in a language of a contracting state other than English, French or German, the **original text** had to be taken into account in order to determine whether the subject-matter of the application extended beyond the content of the application as filed. For further cases under Art. 14(2) EPC and Art. 123(2) and (3) EPC, see e.g. T 516/12 and T 1585/12.

1.2.4 Cross-references to other documents

In T 6/84 (OJ 1985, 238) the board took the view that structural features of a means for performing a chemical process (here the catalyst "offretite"), which were not mentioned in the application documents themselves but in a document (here a Canadian patent specification) to which they referred, could be incorporated into a patent claim if they unequivocally formed part of the invention for which protection was sought (see also T 590/94). However, it was not permissible to single out a particular one of their number (here a silica/alumina ratio) in the absence of evidence that this feature alone was a sufficient characterisation. It was instead necessary to recite fully the other essential components of the structure and the diffraction pattern figures which belonged together, as originally disclosed and defined in that document.

In T 689/90 (OJ 1993, 616) the board decided that features disclosed only in a cross-referenced document which was identified in the description as filed were prima facie not within "the content of the application as filed". Only under particular conditions would adding them to a claim not be an infringement of Art. 123(2) EPC 1973, namely if (a) the description of the invention as filed left the skilled reader in no doubt that protection was sought for those features; (b) they helped achieve the invention's technical aim and thus formed part of the solution to the technical problem underlying the invention claimed; (c) they implicitly clearly belonged to the description of the invention contained in the application as filed (Art. 78(1)(b) EPC 1973) and thus to the content of the application as filed (Art. 123(2) EPC 1973); and (d) they were precisely defined and identifiable within the total technical information contained in the reference document. In the case at issue these requirements were not fulfilled. See also T 196/92, T 558/03, T 1497/06, T 1415/07, T 1378/08, T 664/11, T 1451/12, T 2498/12, T 672/14; see also T 474/05 in which the reference in the application to a document was within a specific context, and the amendment went beyond this context and was thus not allowable; see also T 2477/12, applying T 689/90 in the context of Art. 76(1) EPC where the priority application, containing sequence listings, had been "incorporated by reference" in the parent application.

In T 737/90 the board held that a cross-referenced document could only be taken into account if the relevant addressees of the application containing the reference had ready

access to the referenced document (the EPO before publication of the application and the public after it).

1.3. Standard for assessing compliance with Article 123(2) EPC

1.3.1 Gold standard: directly and unambiguously derivable

Any amendment to the parts of a European patent application or of a European patent relating to the disclosure (the description, claims and drawings) is subject to the mandatory prohibition on extension laid down in Art. 123(2) EPC and can therefore, irrespective of the context of the amendment made, only be made within the limits of what a skilled person would derive directly and unambiguously, using common general knowledge, and seen objectively and relative to the date of filing, from the whole of these documents as filed (G 3/89, OJ 1993, 117; G 11/91, OJ 1993, 125; G 2/10, OJ 2012, 376, referring to this test as "gold standard"; confirmed for disclosed disclaimers in G 1/16, OJ 2018, A70; for undisclosed disclaimers, see however chapter II.E.1.7.2.c). After the amendment the skilled person may not be presented with new technical information (G 2/10).

As can be seen from the "gold standard", the assessment of the requirements of Art. 123(2) EPC is to be done from the standpoint of the **skilled person** (see section II.E.1.3.2 "Standpoint of the skilled person" below).

The subject-matter must be at least implicitly disclosed (T 860/00; see also G 2/10, OJ 2012, 376), see in this chapter II.E.1.3.3 "Implicit disclosure" below.

The boards have emphasised with regard to various tests developed for different cases of amendments that they are only meant to provide an indication of whether an amendment complies with Art. 123(2) EPC as interpreted according to the "gold standard". They may assist in determining the allowability of an amendment but do not take the place of the "gold standard" and should not lead to a different result. See e.g. T 2561/11, T 755/12, T 2095/12, T 2599/12, T 46/15, T 1472/15 and T 553/15 with regard to the "essentiality test", T 1471/10 and T 1791/12 with regard to "intermediate generalisation", and T 873/94, OJ 1997, 456, T 60/03 and T 150/07 with regard to the "novelty test"; note however that special criteria apply for undisclosed disclaimers; for more details on these tests, see chapter II.E.1.4.4 "The essentiality or three-point test", chapter II.E.1.9 "Intermediate generalisations", chapter II.E.1.3.7 "Novelty test" and chapter II.E.1.7 "Disclaimers".

1.3.2 Standpoint of the skilled person

Any amendment can only be made within the limits of what a **skilled person** would derive directly and unambiguously, using common general knowledge, and seen objectively and relative to the date of filing, from the whole of the documents as filed (G 2/10, "gold standard", see above chapter II.E.1.3.1).

The board in T 1269/06 held that, for the assessment of whether, contrary to Art. 100(c) EPC 1973, the subject-matter of the patent extends beyond the content of the application as filed, the key question is whether the amendments made in the description,

or – as in the case at issue – the claims, did indeed provide the skilled person with additional, technically relevant information which was not contained in the original application documents. This cannot be inferred from the fact alone that terms not present in the application documents were subsequently introduced, or from a purely semantic analysis of the contested passages. Instead, the party or department raising the objection must be able to identify clearly the technical teaching as such which has supposedly been added.

In T 99/13 the board recalled, in line with the case law (see T 667/08, T 1269/06, quoted in the decision; see also e.g. T 988/91, T 494/09), that the assessment of the requirements of Art. 123(2) EPC should be done on the same basis as for all other patentability issues (e.g. novelty and inventive step), namely from the standpoint of the skilled person on a technical and reasonable basis **avoiding artificial and semantic constructions**. The skilled person, reading claim 1 as originally filed **from the standpoint of a technician working in the field**, would read the broad condition expressed therein with regard to the viscosity measurement, as a condition to be met at the temperature of use of the claimed formulation and would turn to the description to find further information in this respect. The description specified that the preferred temperature of reconstitution was 25°C and the viscosity measurement was accomplished at 25°C in all examples but one. The only example specifying a different temperature did not fall under claim 1. The board concluded that the amended viscosity condition with the specification of the temperature of measurement "at 25°C" was directly and unambiguously derivable from the application as filed. See also T 2255/12 which guards against an **overly formalistic approach** in which more emphasis is given to the literal content of the original application rather than the technical information that it conveys.

Literal support for amendments in a patent application is **not required** under Art. 123(2) EPC, insofar as the amended or added features reflect the technical information that the skilled person reading the original disclosure would have derived from its content (description, claims and drawings) considered in its entirety (T 1728/12 citing decision T 667/08; see also T 1731/07, T 45/12, T 801/13, T 1717/13 and T 640/14). See also in this chapter II.E.1.3.3 "Implicit disclosure" below.

In T 1717/13 the board noted that the respondent/opponent's objections primarily pointed to differences in the wording between the application as filed and the claim amendments. It was, however, generally accepted that for the purposes of Art. 123(2) EPC an explicit basis for an amendment in the original application documents was not required as long as the amendment was clearly and unambiguously derivable, using common general knowledge, from the application as filed.

The board in T 2619/11 took the view that the focus of the first-instance decision was **disproportionately directed to the structure of the claims** as filed to the detriment of what was really disclosed to the skilled person by the documents as filed. The application was directed to a technical audience rather than to a philologist or logician, for which audience an attempt to derive information from the structure of dependent claims would lead to an artificial result. T 1363/12 considered that T 2619/11 did not lay down a new test (namely, of what was "really disclosed" to the skilled person) different from the "gold

standard" (see in this chapter [II.E.1.3.1](#)) (see also [T.938/11](#)). See also [T.1194/15](#) (referring to [T.2619/11](#)) which accepted in the case at issue that the incorporated features were disclosed in the application as filed as a general disclosure applicable to all embodiment of the invention and considered the contrary approach adopted by the appellant/opponent as very formalistic, without taking into account the type of **audience** to which the patent is directed.

In [T.23/02](#) the board said that although the claims as originally filed contained no reference to a **method of measurement** for the average particle diameter, that did not mean that any method could be used to determine that parameter. If anything, the claims raised doubts as to how the average particle diameter had to be determined, in particular because the skilled person would be aware of the fact that the method of measurement was of a decisive nature in particle size analysis. Therefore the skilled person would use the description and drawings when deciding how the average particle diameter was to be measured, and would come to the conclusion that when properly interpreted in light of the original description, the claims as originally filed already contained restrictions as to the method of measurement for the average particle diameter of the various particles. (For the case law on the need to include the measuring method of a parameter in the claim, see however chapter [II.C.6.6.8](#) "Measuring methods".)

1.3.3 Implicit disclosure

Subject-matter which is implicitly disclosed to the skilled person, using common general knowledge, in the application as filed is part of its content (see [G.2/10](#), OJ 2012, 376). As pointed out in [T.860/00](#), the disclosure **implicit** in the patent application – i.e. what any person skilled in the art would consider was **necessarily implied** by the patent application as a whole (e.g. in view of basic scientific laws) – is relevant for the requirements of [Art.123\(2\) EPC 1973](#) (see also e.g. [T.947/05](#), [T.1772/06](#), [T.1041/07](#), [T.1125/07](#), [T.2541/11](#), [T.2273/12](#), [T.389/13](#), [T.2267/14](#)).

It is essential to identify the actual teaching conveyed by the original disclosure. This approach might lead to the identification of subject-matter which has not been explicitly revealed as such in the application as filed, but nevertheless derives directly and unambiguously from its content. Literal support is not required by [Art.123\(2\) EPC](#) (see e.g. [T.667/08](#), [T.1728/12](#), [T.801/13](#), [T.640/14](#)). See also [T.2177/11](#), referring to [T.667/08](#), and holding that the expression "configured to" was equivalent to the expression it replaced, "capable of", in the context of the invention.

In [T.823/96](#) the board observed that the term "implicit disclosure" should not be construed to mean matter that does not belong to the content of the technical information provided by a document but may be rendered obvious on the basis of that content. The term "implicit disclosure" relates solely to matter which is not explicitly mentioned, but is a **clear and unambiguous consequence of what is explicitly mentioned** (see also e.g. [T.1125/07](#), [T.1673/08](#), [T.583/09](#), [T.2016/11](#), [T.49/13](#); for cases delimiting implicit subject-matter from merely obvious subject-matter, see also in this chapter [II.E.1.3.4 a](#))).

In T.1107/06, in which the original general disclosure taught the use of a substance in the treatment of excessive cholinergic controlled or influenced secretions, the board took the view that when there is a generic disclosure of the invention together with a specific disclosure of an illustrative or preferred embodiment (here treatment of excessive sweating and lacrimation) falling under the generic disclosure, it would normally be implicit for the skilled person that all the other embodiments comprised in the generic disclosure without being mentioned specifically also form part of the invention. See however also below in this chapter II.E.1.6. on selection inventions and II.E.1.10. "Specific derived from generic".

In T.917/94 the board decided that the omission of a feature of a claim did not contravene Art. 123(2) EPC 1973, if this feature was implicitly defined by two other features and, being therefore redundant, its omission created no subject-matter extending beyond that of the application as filed.

In T.1171/08 the respondent (patent proprietor) submitted that there had been no inadmissible extension, if only because all the conditions needed to achieve selective COS removal were implicitly included in the claim by virtue of the **indication of purpose**. The board found that indicating the purpose as a functional feature in a use claim limited the claim to those embodiments whereby the purpose could be achieved. Only to that extent could the indication of purpose implicitly comprise features essential to achieving the desired selectivity. By no means, however, could the indication substitute the essential features specifically disclosed in that connection in an application. In the end, the board held that the skilled person could not derive the new combination of features directly and unambiguously from the application as filed.

1.3.4 Subject-matter not implicitly disclosed

a) Subject-matter merely rendered obvious by the content of the application

In T.329/99 the board stated that a clear distinction had to be made between the questions whether a particular embodiment was disclosed by an application, be it explicitly or implicitly, or/and whether that embodiment was merely rendered obvious by the application's disclosure (referring to T.823/96; see also T.1171/08). A particular technical embodiment might be rendered obvious on the basis of the content of an application as filed without, however, belonging to its explicit or implicit disclosure and therefore without serving as a valid basis for amendments complying with the requirements of Art. 123(2) EPC 1973.

In T.598/12 the board had to assess whether the skilled person using his **common general knowledge** would regard the additional technical information encompassed by the claims after the amendment as directly and unambiguously implicitly disclosed in the parent application as filed. The board stressed that it was not to be investigated whether this technical information derived from the prior art knowledge in the field. What had to be assessed was whether the notional skilled person working in the field would consider something as directly and unambiguously disclosed in the light of this common general knowledge. It recalled that the assessment of what information was implicitly disclosed in an application could not go beyond the limits of what the skilled person would objectively

understand to be a direct and unambiguous consequence of the explicit disclosure in the particular case. Moreover, when performing this assessment, the common general knowledge could not serve to enlarge or replace, in a subjective or artificial manner, the actual content of the specification. The investigation of the actual disclosure in a patent application as filed could not turn into an investigation of obviousness or a search for obvious alternatives of the actual disclosure in the light of general prior art documents.

Referring to T. 598/12, the board in T. 2489/13 confirmed that the criterion of whether alternatives are well known in the field could not be taken as a valid approach for the investigation of at least an implicit disclosure of what is directly and unambiguously derivable from an application as filed within the meaning of Art. 123(2) EPC.

b) Results of reflection and imagination of the skilled person

The board in T. 89/00, citing T. 260/85 (OJ 1989, 105), T. 64/96 and T. 415/91, held that, according to the case law of the boards of appeal, a distinction must be made between what the original documents of a patent directly and unambiguously disclosed to a skilled person and what said skilled person on the basis of this disclosure may do upon reflection and using his imagination. His thinking is **not part** of the content of the original documents of the patent. See also T. 553/15.

In T. 782/16 the board held that for a correct application of the gold standard, a distinction needed to be made between subject-matter which was disclosed either implicitly or explicitly in the original (or earlier) application and therefore could be directly derived from it, and subject-matter which was the result of an intellectual process, in particular a complex one, carried out on what was disclosed. In the case at issue, the appellant's reasoning was based on an intellectual processing of the subject-matter disclosed in the original (or earlier) application rather than a direct and unambiguous derivation as required by the "gold" standard.

c) General open-ended statement in description

In T. 1538/12 the board held that the general statements at the end of the description (e.g. "other variations and modifications of the exemplary embodiments described above may be made" or "other embodiments will be apparent to those skilled in the art") did not constitute, and thus could not replace, a direct and unambiguous disclosure of the particular generalisation. The general statements at the end of the description were furthermore open ended and attempted to burden the skilled reader with having to work out which combinations of features from the detailed embodiments might be claimed together, while the applicant was supposedly dispensed from having to present his invention in terms more general than mere detailed description of particular embodiments.

1.3.5 Conditions insufficient for compliance with Article 123(2) EPC

a) Consistency with original disclosure

In T 495/06 the appellant's argument that the amendments were "not inconsistent" with the original disclosure failed to persuade the board, since the applicant thereby invoked a less stringent criterion for compliance with Art. 123(2) EPC than that developed in the jurisprudence of the boards of appeal, namely the question whether the amendment was "directly and unambiguously derivable" from the application documents as originally filed. In other words, the fact that an amendment was "not inconsistent" with the description was not a sufficient requirement for complying with Art. 123(2) EPC.

In T 962/98 the appellant argued that the claimed subject-matter derived from Example 1D and the content of the application as originally filed. In particular, tests carried out on the composition of Example 1D showed that the "four surfactants" could be applied in a more general context, present claim 1 being, furthermore, consistent with the description. Contrary to the appellant's submissions, in order to assess whether an amendment complied with the requirements of Art. 123(2) EPC 1973, the question was neither whether or not a skilled person could design other compositions in the light of the directions given by the tests nor whether or not the amended subject-matter was consistent with the description.

In earlier decisions, such as in T 514/88 (OJ 1992, 570) the boards observed that the relevant question was whether or not the amendment was "consistent with the original disclosure"; the boards clarified, however, that this meant direct and unambiguous derivability from and no contradiction of the totality of the original disclosure (see also T 527/88 and T 685/90).

b) Reasonable plausibility of the included feature

In T 824/06 the opposition division had rejected the main request because its subject-matter included a temperature maximum for the first *and* the second cooling step whereas the application as originally filed disclosed the requirement that the surface is brought down to this maximum only in relation to the overall cooling treatment. The proprietor had argued that reducing the temperature to this value during the first cooling would be reasonable. The board stated that for an amendment to be allowable under Art. 123(2) EPC its direct and unambiguous disclosure was required; reasonable plausibility was insufficient.

1.3.6 Criteria not relevant for assessing compliance with Article 123(2) EPC

a) Obviousness

In T 823/96 the board observed that, whilst common general knowledge must be taken into account in deciding what is clearly and unambiguously implied by the explicit disclosure of a document, the question of what may be rendered obvious by that disclosure in the light of common general knowledge is not relevant to the assessment of what is

implied by the disclosure of that document. On the contrary, these two questions must be strictly separated.

b) Indication in the description that subject-matter is known to the skilled person

In T 903/16 the examining division had argued that the original disclosure did not indicate or imply that the devices described therein could be new and inventive and had considered the later claiming of such devices as an infringement of Art. 123(2) EPC. The board emphasised that the fact that in the application the disclosed range of devices is stated to be within the means known to the skilled person may be considered when examining other EPC requirements, but it has no bearing on the question of disclosure for the purposes of Art. 123(2) EPC.

c) Enabling disclosure

In T 1724/08 the board held that the criterion of "direct and unambiguous disclosure" was quite different from the criterion submitted by the appellant, namely whether a person skilled in the art in view of the disclosure was enabled to achieve the envisaged result, i.e. the claimed functionality, without undue difficulty. This latter criterion would allow many different new definitions of subject-matter, none of which would need to be derivable "directly" and "unambiguously" from the earlier application as filed.

In T 2593/11 the examining division had taken the view that it was not self-evident that devices according to claim 1 could actually be manufactured using a specific fabric and, therefore, the manufacturing of the device using this fabric was not disclosed. The board observed that the requirements of Art. 123(2) EPC differed from those of Art. 83 EPC. Art. 123(2) EPC aimed more particularly to prevent inventors from obtaining protection for inventions they had not thought of at the date of filing, respectively not put into their application as filed. Art. 83 EPC aimed more particularly to prevent them from obtaining protection for "theoretical" inventions which could not be carried out at the date of filing. While in some specific instances there might be a link between the two, in the case at issue, the manufacturing of the device using the specific fabric was clearly disclosed.

d) Limitation of scope of the original claim

In T 288/92 the appellant (applicant) contended that the amendment resulted in a limitation of the original claim. The board rejected this argument on the grounds that the expression "subject-matter which extends beyond the content of the application as filed" in Art. 123(2) EPC 1973 prohibited the introduction of any technical information which a skilled person would not have objectively derived from the application as filed, so that the examination of the allowability of an amendment according to Art. 123(2) EPC 1973 was directed to the process of "derivation" (see also T 383/88), as distinct from a simple comparison of the scopes of amended and unamended subject-matters.

1.3.7 Novelty test

In T 201/83 (OJ 1984, 481) it was stated that the test for compliance with Art. 123(2) EPC 1973 was basically a novelty test, i.e. no new subject-matter may be generated by the amendment (see also T 136/88). T 17/86 (OJ 1989, 297, Corr. 415) added that novelty could be found in a limitation, the addition to a claim of a further feature, or even in the absence of one of the elements of a device. In G 2/10 the Enlarged Board held that after the amendment the skilled person "may not be presented with new technical information" and stressed the importance of applying a uniform concept of disclosure (with reference to Art. 54, 87 and 123 EPC).

The boards have highlighted the limitations of this test (see T 194/84, T 133/85, T 177/86, T 118/89, T 187/91, T 288/92 and T 873/94 below). They have seldom expressly applied the novelty test in their recent case law, but it was referred to in e.g. T 60/03, T 1374/07, T 2202/08, T 2270/09 (see also T 1710/09 where the board referred to the test of T 12/81 which was developed for novelty). According to T 2537/10, the novelty test is no longer relevant for the assessment under Art. 123(2) EPC. However, reference is still made to this test in the 2018 version of the Guidelines (H-V, 3.2) for inclusion of additional features: If the resulting combination is new over the application as originally filed, the amended claim does not fulfil the requirement of Art. 123(2) EPC.

Decision T 194/84 (OJ 1990, 59) related to amendments leading to the generalisation of the subject-matter of an application or to the omission of a feature. The patentee had taken the view that the amendment was admissible because the original application could properly be cited against the novelty of a more generic claim. The board took the view that this approach was based on a misapplication of the novelty test. The test for additional subject-matter corresponded to the test for novelty only in so far as both required assessment of whether or not information was directly and unambiguously derivable from that previously presented in the originally filed application or in a prior document respectively. An amendment was not allowable if the resulting change in content of the application, in other words the subject-matter generated by the amendment, was novel when compared with the content of the original application or, looked at another way, if the said change in content would be novelty-destroying for a hypothetical future claim when the original content would not be.

T 133/85 (OJ 1988, 441) pointed out that care was necessary when applying the law relating to novelty to questions which arose in relation to Art. 123(2) EPC 1973. In T 177/86 the novelty test was described as "not very useful" for examining the admissibility of broadening a claim (see also T 150/07 for a case where the preferred embodiments of an invention were combined with the more general teaching thereof).

Likewise T 118/89 took a reserved attitude to the novelty test and observed that the allowability of amendments during the grant procedure could be determined without reference to the state of the art simply by comparing the protection sought on the basis of the current claims with the disclosure in the application as filed. There was therefore no objective need to carry out new or modified novelty tests.

In T.187/91 (OJ 1994, 572) the board conceded that there was clearly a close conceptual correlation between the assessment of novelty and the assessment of what was an allowable amendment under Art. 123(2) EPC 1973. It further explained, however, that the considerations which underlay Art. 123(2) EPC 1973 were different from those that underlay Art. 54 EPC 1973: One consideration which underlies Art. 123(2) EPC is that the content of the application as filed and as published determines the matter for which protection may be sought in the claims of that application and accordingly gives an indication to the public of the protection which may be granted. A further consideration underlying the relationship between the claims and content of the European patent application is that, after appropriate amendment if necessary, the granted claims should give a fair protection for the inventive subject-matter contained in the application as filed.

In T.288/92 the board considered that the examination of the allowability of an amendment according to Art. 123(2) EPC 1973 was directed to the process of "derivation" (see also T.383/88), as distinct from a simple comparison of the scopes of amended and unamended subject-matters. In the view of the board this provided a definitive method for deciding the allowability of an amendment. Any other "test", such as the "novelty test", necessarily posed hypothetical questions.

In T.873/94 (OJ 1997, 456) the board pointed out that where a proposal for amending an application involved the **addition of a limiting feature** to a claim, applying a "novelty test" was not appropriate for determining whether or not the amendment complied with Art. 123(2) EPC 1973.

1.3.8 Non-technical subject-matter

In case T.619/05 the amendment concerned a feature not contributing to the solution of any technical problem by providing a technical effect. It was thus non-technical subject-matter. The term "subject-matter" in Art. 123(2) EPC, without a qualifier, seemed to indicate that this article applied to non-technical as well as technical subject-matter. Thus, any amendments concerning non-technical subject-matter should also be derivable from the patent application as filed. A difficulty in this connection was that a technically skilled person might not have the knowledge necessary in order to determine whether non-technical subject-matter had been added or not. Since the members of a board of appeal were only required to be technically (or legally) qualified under Art. 21 EPC 1973, it would be up to the applicant (or patent proprietor) in such circumstances to provide evidence permitting a board to determine to its satisfaction how a person skilled in the relevant non-technical field would interpret the original patent application and the application (or patent) after amendment. For the case law on non-technical distinguishing features in the framework of novelty, see chapter I.C.5.2.8 above.

1.3.9 Claim interpretation when assessing compliance with Article 123(2) EPC

In T.1946/10 the board held that according to established jurisprudence the skilled person interprets a claim with a mind willing to understand, so as to arrive at an interpretation which is technically sensible and takes into account the whole disclosure of the patent. Though he strives in principle to understand a claim within the wording and terms of the

claim itself, he may, where he encounters ambiguities, need to consult the description and drawings to gain a better understanding. Based on the understanding of the added feature gained by this claim interpretation, the board arrived at the conclusion that adding the feature to claim 1 as originally filed in isolation from its structural and functional context presented a new teaching not originally disclosed.

The board in T 1018/02 stated that although a claim was not to be interpreted in a way which was illogical or did not make sense, the description could not be used to give a different meaning to a claim feature which in itself imparted a clear, credible technical teaching to the skilled reader. That also applied if the feature had not initially been disclosed in the form appearing in the claim (see also e.g. T 396/01, T 1195/01, T 1172/06, T 1202/07, T 369/10, T 474/15). In the case at issue the claim feature in question would have had to be deleted to achieve consistency with the original disclosure; however this was not possible under Art. 123(3) EPC 1973.

In T 1408/04 the board held that while the claims had to be interpreted by a "mind willing to understand" and not by "a mind desirous of misunderstanding", this was understood to mean only that technically illogical interpretations should be excluded (see T 190/99). The terms to be interpreted had a wider technical interpretation than envisaged by the appellant. A "mind willing to understand" did not require that a broad term needed to be interpreted more narrowly (even if the narrow interpretation referred to a structure which was very common, but not exclusive, in the technical field concerned), but instead that a broad term should be interpreted with regard to all technically logical interpretations thereof. Based on this understanding of the limiting terms introduced into the claim the board came to the conclusion that the amendment to claim 1 as granted resulted in an intermediate generalisation.

In T 241/13 the board held that the description did not give a precise definition of the meaning of the expression "minimum intensity level"; the patentee's interpretation of this expression was not clearly excluded. However, that such an **ambiguous expression** as filed might be interpreted in a particular way was not sufficient to ensure the compliance of an amendment, based on that interpretation, with Art. 100(c) EPC which required a direct and unambiguous disclosure in the application as filed. In the present case, no direct and unambiguous disclosure could be found for the patentee's interpretation.

In T 2002/13 the board referred to established case law, in particular T 190/99 (see chapter II.E.2.3.3 "General claim interpretation") according to which the claims must be read with a mind willing to understand and to make technical sense of them, thereby ruling out illogical or technically meaningless interpretations. The board recalled that the claims were directed to a person skilled in the art. However, the case law did not allow the reader to disregard an illogical or technically inaccurate feature of a claim and hence to interpret such a feature in a correct manner. Thus, if a claim included **contradictory features**, this contradiction could not be resolved by merely disregarding the technically inaccurate feature and considering only the convenient technically meaningful feature. All the less so when assessing the compliance of these two features with Art. 123(2) EPC. In the board's view, any other approach would provide an unwarranted advantage to the

patentee/appellant. See also the abstract of T 81/13 in chapter II.E.1.4.7. "Elimination of contradictions and inconsistencies".

In T 916/15, the board took the view that the jurisprudence of the boards of appeal referring to "a mind willing to understand" did not apply for the purpose of assessing the allowability of amendments under Art. 123(2) EPC. It followed from T 190/99 that this concept applied only where it was necessary to interpret a claim of a granted patent for the purposes of Art. 123(3) EPC and Art. 69 EPC.

According to the board in T 1688/12, the mere fact that a dependent claim encompassed a host of possible but undefined embodiments did not mean that the claim on which it depended had to be interpreted as compatible with all those embodiments.

1.4. Removal or replacement of features from a claim

1.4.1 Broadening of claim – permissible within the limits of the original disclosure

The deletion of a feature in a claim as filed may lead to a broadening of the claim. According to G 1/05 (OJ 2008, 271, referring to G 1/93, OJ 1994, 541), the applicant has a right to amend the claims so as to direct them to subject-matter not encompassed by the claims as filed. It is only after grant that the interests of third parties are further protected by Art. 123(3) EPC and the patentee's right to amend the claims is limited by the scope of the granted patent.

In T 133/85 (OJ 1988, 441) the board held that it was possible to broaden a claim (i.e. to extend the protection conferred by it) without contravening Art. 123(2) EPC, provided that the subject-matter which was within the claims for the first time as a result of the amendment was already disclosed within the content of the original application as filed (confirmed e.g. in T 732/00, T 273/04, T 1211/05).

In T 66/85 (OJ 1989, 167) it was pointed out that if a technical feature was deleted from a claim in order not to exclude from protection certain embodiments of the invention, the broadening of the claim did not contravene Art. 123(2) EPC 1973 as long as there was a **basis for a claim lacking this feature** in the application as originally filed (see also T 228/98).

In T 1724/08 the board held that the broadening of individual disclosed features, in particular those of an independent claim as filed, was not prohibited by Art. 76(1) EPC 1973; such amendments likewise required a direct and unambiguous disclosure in the earlier application as filed (see also T 1727/09).

1.4.2 Basis in the application as originally filed – gold standard

The requirement of Art. 123(2) EPC as applied to the claims means that it is only permissible to delete features from an independent claim if there is a clear and unambiguous basis for a claim lacking these features in the application as originally filed (T 1726/06, referring to T 66/85, OJ 1989, 167).

The board in T.755/12 pointed out that, although some tests such as the essentiality test (see in this chapter II.E.1.4.3 and 1.4.4 below) have been used as an **aid** in assessing the allowability of amendments, they could not replace the need to answer the question of what a skilled person would objectively have derived from the description, claims and drawings of a European patent application on the date of filing (G.3/89, OJ 1993, 117, see in this chapter II.E.1.3.1 "Gold standard: directly and unambiguously derivable" above). For further decisions highlighting that these tests are only tools and do not take the place of the "gold standard", see T.648/10 and the decisions cited in this chapter II.E.1.4.4 b).

The board in T.2599/12, after finding that that the amendment complied with the "gold standard", held that there was no need for any further investigation, such as applying the test laid out in T.331/87 (see in this chapter II.E.1.4.4 "The essentiality or three-point test" below). Ultimately, this test was meant to provide an indication of whether an amendment complied with Art. 123(2) EPC as interpreted according to the "gold standard". It did not take the place of the "gold standard" and should not lead to a different result than when applying the "gold standard" directly.

In T.558/13 claim 1 according to the main request differed from claim 1 of the earlier application as filed in that the following feature had been omitted: "... a plurality of power sources are independently provided for each of the plurality of groups." Instead, claim 1 of the main request specified that the read out circuit comprised a plurality of sample and hold circuits. The board considered that the concept of the invention as consistently presented in the earlier application as filed required the provision of independent power sources. It accepted the appellant's argument that the shifted timing of the reset and sample and hold circuits provided the new technical advantage of "reducing a line noise caused by an external noise". Nevertheless, in the board's view, it was not sufficient to prove that the omitted feature was "not indispensable for achieving the effect of reducing line noise caused by external noise". Such reasoning did not take sufficient account of the **information conveyed by the earlier application as a whole**, which was primarily concerned with providing independent power sources and which only presented the additional technical effect caused by the shifted timing as a side issue. There was no room for speculation as to which features of the disclosed invention(s) might be omitted on further reflection, if there was no explicit or implicit disclosure of the generalised subject-matter remaining after the omission of these features.

1.4.3 Omission of a feature presented as essential

For cases in which the amendment consists of the replacement or removal of a feature from an independent claim, the boards occasionally apply the test of decision T.260/85 (OJ 1989, 105). In T.260/85 it was stated that it was **not** permissible to delete from an **independent claim** a feature which the application as originally filed **consistently presented as being an essential feature** of the invention, since this would constitute a breach of Art. 123(2) EPC 1973. See also T.496/90, T.415/91, T.628/91, T.189/94, T.1032/96, T.728/98 (OJ 2001, 319; concerning the deletion of the feature "substantially pure"), T.1040/98, T.1034/02, T.2202/08 and T.1390/15.

In [T.236/95](#) the board held that if the problem could not be solved without the features concerned, they could not be considered unimportant.

In [T.784/97](#) the patent proprietor alleged that a prior art document would have made the skilled person aware that the disputed feature was not essential. The board held that whether or not a feature of an independent claim had to be seen as "essential" could **not be a question of the prior art disclosure**. Rather, what had to be decided was what a skilled person was taught by the originally filed documents.

In [T.1515/11](#) the board observed that a feature could not be deleted from an independent claim if it had been consistently presented as an essential feature of the invention, since this would add subject-matter. In some cases there might be room for debate as to whether the application presents a feature as being essential to the invention or as being optional. However, there were also cases where, on purely formal grounds, the essentiality of a feature could not be doubted. One such case was where the applicant chose to include in an independent claim as filed a feature explicitly mentioning the problem, and affirming that the claimed subject-matter represents a solution to the problem. In particular, where a claim to a method included a feature explicitly defining that the method was carried out in a manner which solved the problem, to argue that this feature was not essential would be tantamount to arguing that in order to solve the problem, it was not essential to carry out the method in a way which solved the problem.

The board in [T.648/10](#) confirmed the test set out in [T.260/85](#). However, it observed that **the EPC does not require the use of any particular tests** when assessing whether subject-matter has been added. Instead, such tests are **tools** which may be helpful, in certain situations, in the assessment of whether subject-matter has been added.

1.4.4 The essentiality or three-point test

a) Decisions setting out and applying the test

In [T.331/87](#) (OJ 1991, 22) the board, building on [T.260/85](#) (OJ 1989, 105) set out a three-point test. The board held that the replacement or removal of a feature from a claim might not be in breach of [Art.123\(2\),EPC.1973](#) if the skilled person would directly and unambiguously recognise that (1) the feature was not explained as essential in the disclosure, (2) it was not, as such, indispensable for the function of the invention in the light of the technical problem it served to solve, and (3) the replacement or removal required no real modification of other features to compensate for the change. The board also observed that the feature in question might be inessential even if it was incidentally but consistently presented in combination with other features of the invention (frequently applied until 2012, see e.g. [T.708/07](#), [T.775/07](#), [T.2359/09](#), [T.747/10](#); recently applied in [T.1906/12](#)). This test is sometimes referred to as the essentiality test (see e.g. [T.2359/09](#), [T.2599/12](#), [T.2489/13](#)). Note that the Guidelines H-V, 3.1 – November 2018 version now contain a modified three-point test.

In [T.404/03](#) the board considered that the decisions of the boards of appeal describing and using the current palette of "tests" in connection with various types of amendments

might lead to some confusion. As far as the disclosure of a group of features was concerned, as distinguished from their scope, the generalisation of a feature in a claim and the isolation of features from embodiments in the description essentially both involved a deletion of a feature, namely the specific feature and the remaining features of the embodiment respectively. The board therefore considered that these cases could be subject to the same criteria as a pure deletion, and hence, in principle, the three-point test. Rather than requiring a specific statement or suggestion in the original disclosure, the three-point test was more generous to the applicant because it essentially allowed the deletion of a feature if the skilled person realised from the common general knowledge in that field that the feature had nothing to do with the invention. Moreover, in the board's view, the cases of deletion of features and addition of features had to be distinguished with respect to the allowability of amendments under Art. 123(2) EPC 1973, since the former only removed elements that were originally disclosed and hence might be judged by a skilled person to be inessential to the invention, whereas the latter added new elements lacking any basis whatsoever in the original disclosure.

In T.2300/12 the board held that the purpose of the essentiality test was to ascertain whether the replacement or removal of a feature in an originally filed independent claim resulted in an extension beyond the content of the application as originally filed. In the case at issue, however, the granted claim was for a process, whereas there had been no such process claim in the set of claims originally filed. For that reason alone, the essentiality test could not be directly applied to establish whether there had been such an inadmissible extension.

In T.2100/14 the board held that the first criterion of the three-point essentiality test was not met. Although the description did not mention features A and B explicitly as being essential, the person skilled in the art directly and unambiguously recognised that the balcony structure disclosed in the application required a corrugated plate as defined by features A and B. The mere fact that features A and B were specified in the preamble portion of the independent claims did not mean that the presence of a corrugated plate was not mandatory for the invention. A feature of the preamble portion of an independent claim was part of the definition of the claimed subject-matter which was deemed to solve the technical problem assessed in the application. Therefore, features A and B, relating to the corrugated plate, contributed to the definition of the invention as originally filed and were thus presented as essential in the application as originally filed.

b) Mere aid in assessing the allowability of amendments

The board in T.1472/15, citing T.2311/10 and T.1852/13, held that, contrary to how T.331/87 had often been misinterpreted, the "essentiality test" was not absolute vis-à-vis the "gold standard" and could merely be used as an aid in ascertaining what had been originally disclosed (see also T.648/10, T.755/12, T.2095/12 and T.46/15).

c) Decisions criticising the three-point test

In T.910/03 the board criticised the second condition of the essentiality test (omitted feature not, as such, indispensable for the function of the invention in the light of the

technical problem it serves to solve). The board criticised this approach in the light of G 2/98 (OJ 2001, 413) for being tantamount to making a distinction between technical features which were related to the function and the effect of the invention and technical features which were not. In the case at issue, the board came to the conclusion that nowhere in the application documents as filed as a whole was it stated, suggested, or hinted at, that the presence of the deleted element was optional, or that the element, or elements, could be omitted.

In case T 2311/10 which concerned an intermediate generalisation, the board expressed the view that the three-point or essentiality test was unhelpful or even misleading (see also T 1840/11, T 2095/11, T 2095/12). In particular, the board highlighted, with regard to the second criterion, that the test of T 331/87 necessarily had to relate to the problem derivable from the application as it concerned the disclosure of the application. This was however not always observed.

In T 1852/13 the board concluded that the three-point essentiality test developed in T 331/87 should no longer be used (similarly T 830/16): in view of that earlier decision's wording ("may not"), logic alone dictated that it could not be congruent with the "gold standard" (G 2/10). Indeed, even the board that had developed the test had acknowledged that it might be met, yet Art. 123(2) EPC still infringed. Although the essentiality test could be a useful indicator in certain cases, the "gold standard" was the only test that counted (see T 755/12). Moreover the Enlarged Board, in G 2/98, ruling on when a priority claim was valid, had rejected the essentiality-based approach taken in T 73/88 (Snackfood), laying down instead a condition analogous to the "gold standard", and its concern that evaluations of essentiality might be arbitrary applied to amendments too. The board therefore agreed with T 910/03 that the conclusion to be drawn from G 2/98 was that the essentiality test should no longer be applied. Another advantage of the "gold standard" over the essentiality test was that it was a single test for all types of amendment.

1.4.5 Removal of set of features

In T 211/95 the examining division had refused a divisional application on the grounds that a set of features from the original claim of the parent application was entirely missing from the claim of the divisional application. The board was unable to accept this. It held that the requirements under Art. 76(1) EPC 1973 would be met if it was obvious for the skilled person that there were **two technically unconnected teachings** which could be claimed separately, and if the skilled person clearly saw that the set of features according to the subject-matter claimed in the parent application was **not essential** to the subject-matter claimed in the divisional application. In the case at hand, the subject-matter of the divisional application was directly and unambiguously disclosed in the parent application. See also T 341/06 and T 694/07.

1.4.6 Removal of a feature indicating the intended purpose

In T 448/03 the claim as granted referred to an "apparatus for ejecting liquid or powdered medium", whereas claim 1 and the description as originally filed referred to an "apparatus for impulse fire extinguishing". The board observed that according to case law, "for" had

to be interpreted as meaning "suitable for" and thus "for" did not limit the use of the apparatus to extinguishing fire exclusively. However, the fact that the apparatus was suitable for a given use or was suitable to contain a specific medium implied specific requirements regarding the material the apparatus was made of and its capacity to contain the volume of medium which was necessary to achieve the expected effect, which was to extinguish fire. See also T.1143/17 where the board held that the feature "usable in a process of extrusion coating ..." could only be removed without extending the subject-matter if all compositions defined by amended claim 1 could be used in such a process.

In T.653/03, the original term "diesel engine" in claim 1 was replaced by the term "combustion engine". Thus, the suitability of the claimed method had been generalised. The board did not share appellant 1's view that the intended purpose of the method did not provide a technical contribution to the invention. The technical contribution was that the amended method had to be suitable for any type of combustion engine. Whether the method steps needed real modification or not was irrelevant when the amendment of the claim was not supported by the original application. See also T.923/13 concerning the deletion of the words "for paper containers".

For cases where the removal of a use or purpose feature was considered allowable, see however e.g. T.692/97, T.835/97 and T.235/99. See also T.308/13 where the board came to the conclusion that a certain clause in the description addressed the intended purpose rather than a further functional definition of the claimed compounds and therefore did not need to be included in the claim to avoid an intermediate generalisation.

1.4.7 Elimination of contradictions and inconsistencies

In T.271/84 (OJ 1987, 405) it was stated that an amendment to a claim to clarify an inconsistency did not contravene Art. 123(2) or Art. 123(3) EPC 1973 if the amended claim had the same meaning as the unamended claim, on its true construction in the context of the specification.

In T.758/92 the board allowed the deletion of a feature because it was clearly inconsistent with the teaching disclosed in the application as filed, and there was a clear basis in the original disclosure for its deletion. A skilled reader of the original application documents would have realised that the feature to be deleted was erroneously introduced in the claim because the resulting definition was contradictory to the functioning of the described embodiment of the invention.

In T.609/95 the board took the position that where a drafting defect or inconsistency in an application would be evident to a reader skilled in the art, the person to whom the application is addressed, it is reasonable to suppose that he would, in the light of the content of the application, attempt to formulate a notional amendment which would enable him to make sense of what he reads, and to the extent that the amendment might be said to leap to the mind of the reader, although perhaps only after close study of the document, it can be regarded as implicit in the application and would not contravene Art. 123(2) EPC 1973, if effected in practice (see also T.887/97 for such amendment during opposition appeal proceedings).

In T.1464/05 the board said that the further attempt of the respondent (patent proprietor) to see in the upper ends of range values a removable inconsistency in the application as filed could not, in the context of a wholly consistent and clear disclosure of the application, be accepted.

In T.81/13 the board refused claim 1 of the main request as it contained a viscosity feature which the board considered not clear (Art. 84 EPC). In claim 1 of the auxiliary request the appellant deleted this viscosity feature and argued that an unclear and unmeasurable viscosity value was not essential and could be omitted for this reason from the claim; this omission should also be possible to escape the Art. 84 and 123(2) EPC "squeeze", which would lead to an "inescapable trap". The board held that this parameter was revealed to be unclear but remained an essential feature since, even unclear, it conferred on the composition a particular aspect and reflected a composition having specific and essential properties. Also, the presence of an unclear essential feature in a claim did not inevitably lead to an "inescapable trap". If the omission of such feature reflecting essential properties of a claimed product was not possible, its replacement by an equivalent feature providing inevitably the same essential property could be considered as normally feasible. This was usually possible through the incorporation of adequate technical features able to provide inevitably said property. As a last resort, the claimed subject-matter could even have taken the form of an exemplified subject-matter. In the case at issue, the application as originally filed presented a disclosure deficiency and if there was an inescapable trap, it was rather linked to this deficiency.

1.5. Ranges of parameters – setting upper and lower limits

1.5.1 Forming a range by combination of end-points of disclosed ranges

The board in T.925/98 noted that, according to the respondent, the range 30% to 50% given in claim 1 infringed Art. 123(2) EPC 1973, since such a range was not disclosed in the originally filed documents of the patent in suit, which only disclosed a general range of 30% to 60% and a preferred range of 35% to 50%. The board held, however, that, according to the established case law, in the case of such a **disclosure of both a general and a preferred range**, a combination of the preferred disclosed narrower range and one of the part-ranges lying within the disclosed overall range on either side of the narrower range was unequivocally derivable from the original disclosure of the patent in suit and thus supported by it (see T.2/81, OJ 1982, 394; T.201/83, OJ 1984, 481; and T.53/82, T.571/89, T.656/92, T.522/96 and T.947/96 all referring to T.2/81). Thus claiming a range from 30-50% did not contravene Art. 123(2) EPC 1973. In the case in point, moreover, graphs indicated that the claimed range was in fact the most efficient one. This frequently cited decision was referred to, for example, in T.328/10, T.2001/10, T.227/13; see also T.1107/06.

In T.249/12 the board held that the conclusion of T.2/81 according to which the amendment made was allowable was arrived at by inter alia considering that the new range was "unequivocally and immediately apparent to the person skilled in the art"; according to the board in T.249/12 this was equivalent to the "gold standard".

In T.1170/02 the board held that the combination of the lower limit of the general range with the lower limit of the preferred range, thus **excluding the preferred range**, did not fall under the principles developed in decision T.2/81 (OJ 1982, 394). In such a case, it might be useful to ask whether the skilled reader of the parent application would **seriously contemplate** working in the range referred in the divisional application or alternatively whether there was anything in the parent application as filed or his common general knowledge which would cause him to exclude the possibility of working in that range (with reference to T.187/91, OJ 1994, 572). To the board, the skilled person would, in view of the data in the parent application, seriously consider working beyond the lower limit of the preferred range as well. Under these circumstances, the range could be directly and unambiguously derived from, and is consistent with, the parent application as originally filed. See also T.1389/08 and T.205/13.

In T.612/09, however, the board observed that T.2/81 had established a two-step approach. In the first step, it had considered that the two part-ranges of the general range (in T.612/09: 3 to 75 mg/kg) lying outside the preferred range (in T.612/09: 10 to 25 mg/kg) would be unequivocally and immediately apparent to the person skilled in the art. It had then considered that no new matter was introduced by combining the preferred range with the upper part-range. The board in T.612/09 considered that only the first step of the analysis carried out in decision T.2/81 was necessary to arrive directly and unambiguously at the claimed range. Indeed, the board held that the two part-ranges lying within the overall range on either side of the narrower range (a dose of 3 to 10 mg/kg and a dose of 25 to 75 mg/kg) were directly and unambiguously disclosed to the person skilled in the art. See also T.2159/11.

In T.1919/11 the subject-matter of claim 1 of the main request related to silver at a concentration of at least 1µM to less than 200µM. In the description, it was stated in two separate consecutive sentences that "When silver is incorporated in the medium, it will be added at a concentration of less than 900 µM, preferably less than 500 µM, and more preferably less than 200 µM" and "When silver is incorporated in the medium, it will be added at a concentration of at least 10 nM, preferably 100 nM, more preferably 1 µM, and typically at 10 µM". The board observed that the situation in the case at issue was not comparable with that in T.1107/06 and dealt with in the settled jurisprudence of the boards of appeal. A general range, which means a lower limit which is unequivocally combined with an upper limit, and a preferred disclosed narrower range – equally consisting of a lower limit which is unequivocally combined with an upper limit – were simply missing. Even a kind of parallel structure in indicating the upper and lower limits (less/at least, preferred or more preferred) implied **no unequivocal correlation between a particular upper limit and a particular lower limit** because there was no teaching that such an arrangement was intended. Therefore, one of the upper limits mentioned in the first sentence in the description of the parent application as originally filed (as cited above) and one of the lower limits mentioned in the second sentence were arbitrarily combined, which did not represent a direct and unambiguous disclosure.

In T.1990/10 the board had to decide whether the application as filed provided a basis for the temperature range "below 35°C" in claim 1. The application as filed disclosed various temperatures, both specific temperature values ("30°C") and temperature ranges, such as

open-ended ranges ("below 37°C") and closed ranges with defined upper and lower-end values ("30°C to 35°C"). The board considered that the term "below" was explicitly disclosed only for defining the broadest mentioned temperature range, namely "below 37°C". The board held that "below 35°C" was also not implicitly derivable from the broadest open-ended range "below 37°C" in combination with the upper-end value of the closed range "30°C to 35°C". Applying the criteria of T. 2/81, the combination of the lower-end and the upper-end values of the closed range with the broadest temperature range would result in the temperature ranges "30°C to below 37°C" and "35°C to below 37°C", not however, in the open-ended temperature range "below 35°C". In addition, the closed temperature range "30°C to 35°C" included the specific temperature "35°C" whereas the open-ended range "below 35°C" in claim 1 explicitly excluded this value. It was also not a combination of ranges and sub-ranges as explained in T. 2/81 to merely transfer the term "below" in "below 37°C" to the upper end value of "30°C to 35°C". In the absence of any indication in the application as filed to do so, this transfer of the term "below" to another temperature value or temperature range had no basis in the application as filed. The board also had to decide whether the application as filed provided a basis for the temperature range "about 26°C to 32°C", which it rejected.

In T. 249/12 the board allowed the amendment to the range of "10-50 mass %", which combined the use of the upper limit of the less preferred broader range (50 mass %) and the lower limit of the most preferred narrower range (10 mass %). Since both end-points of the new range were both specifically mentioned in the application as filed, the new range was "unequivocally and immediately apparent to the skilled person" (T. 2/81), i.e. the range was directly and unambiguously disclosed in the application as filed. See also T. 1143/17 which relates to the combination of the lower end-point of a preferred range with the upper end-point of a more preferred range.

In T. 1320/13 claim 1 defined a specific ratio in the range of "between 0.6 and 1". The appellant argued that the range had a basis in the disclosure of the range "0.1 and about 1" in claim 5 in conjunction with the value "0.6" disclosed in a **list of individual values**, which read: "about 1.0, 0.9, 0.8, 0.7, 0.6, 0.5, 0.4, 0.3, 0.2, 0.1 or even 0, derivable therein". The board held that T. 2/81 did not apply in the case at issue. The skilled person would not regard the list of individually disclosed values of ratios on page 5 of the application as individual end-points of ranges. Firstly, a list of individual values – even if disclosed as here in descending order – did not relate to values that lie between them, while a range necessarily encompasses all the values that lie between its two disclosed end-points, i.e. a list of individual values is conceptually different from a range. Secondly, the list contained no pointers to a particular combination of ratio values. Accordingly, a specific selection of values also did not clearly and unambiguously emerge for the skilled person from the content of the application.

In T. 703/16 the board held that a peptide fragment constituted a discrete physical entity, made up of individual amino acids and having defined physical end-points, which was not comparable to a range of a quantitative parameter within which the invention can be performed (distinguishing its case from T. 2/81 and T. 1063/96).

1.5.2 Forming a range with isolated value taken from example

In T 201/83 (OJ 1984, 481), the board came to the conclusion that the amendment of the concentration range for a claimed mixture, such as an alloy, was admissible on the basis of a value described in a specific example, provided that the skilled person could have readily recognised that this value was **not so closely associated with the other features of the example** as to determine the effect of that embodiment of the invention as a whole in a unique manner and to a significant degree. In the case at issue, the new limit could be deduced from the original documents.

The board in T 876/06 applied the principle established in T 201/83 and came to the conclusion that the skilled person could have recognised in the application as originally filed that the weight ratio of liquid rubber to solid rubber was not so closely associated with the other features of the examples as to determine the effect of the invention as a whole in a unique manner and to a significant degree. Thus, it was permissible to use the particular value used in several examples to limit the range of the weight ratio of liquid rubber to solid rubber. The limitation of the claim represented merely a quantitative reduction of a range to a value already envisaged within the document and not an arbitrary restriction providing a technical contribution to the subject-matter of the claimed invention. The board also found incorrect the argument of the respondent (opponent) that the amendment in T 201/83 was only considered allowable because it represented the lowest value disclosed with regard to the then claimed invention. In the board's view this fact played no role at all. The requirements of Art. 123(2) EPC 1973 were fulfilled.

In T 612/09 the board considered that in the case underlying decision T 201/83 the fact that the value was disclosed in an example was insofar of relevance as the board had first to establish that the value disclosed in the context of an example could be considered separately from the other features disclosed in the example. However, the board in T 612/09 could not derive from decision T 201/83 the requirement that the value on which a sub-range was to be based had necessarily to be disclosed in an example. Rather it appeared that what was required was that for the skilled person the value had to be recognisable as a singularity, as in decision T 201/83, within or at the end of a range of possibilities which may mark an end-point for a particular sub-range.

In T 517/07 a newly introduced upper limit had been disclosed in the original application documents only as an isolated value in example 1. The board decided that singling out an individual value from a specific embodiment and applying it as a new upper limit in claim 1 created a new – now capped – value range that was not disclosed in the original documents.

In T 1188/10 the broadest general range relating to the concentration of LAE in food products, disclosed in the application as filed, was from 0,0001% to 1%. The new range of 0,006% to 0,015% was formed by taking, as end points, single values from examples 2 and 4 relating to the use of LAE as preservative in two different specific food products at different growth temperatures. In order to assess whether this new range complied with Art. 123(2) EPC it had to be considered whether a skilled person, in analogy to T 201/83, would generalise these values in the sense that he would recognise them as not only

associated with the specific food products and temperatures used in the examples. In the case at issue, this was the case so that the range claimed complied with Art. 123(2) EPC.

The board decided in case T 184/05 that an impurity concentration value of a product obtained under specific process conditions could not be taken in strict isolation from the examples unless it had been demonstrated that this value was not so closely associated via the applied process with specific (undisclosed) maximum values of all other impurities comprised in the product.

In T 570/05 the proposed amendment was that the coating layer had a "thickness of from 220 to 500 nm", for which the only literal basis in the application as originally filed for the lower value of 220 nm of the claimed range was to be found in three examples; nowhere in the documents as filed did this value form the lower (or indeed any) endpoint of a range of thicknesses. Recalling the relevant case law namely, T 201/83, T 1067/97 and T 714/00 (see also in this chapter II.E.1.9. "Intermediate generalisations"), dealing with extracting an isolated feature, the board examined whether or not there existed a functional or structural relationship between the coating layer thickness, in particular its lower limit, and the remaining features of the claim. The board concluded that the condition of absence of any clearly recognisable functional or structural relationship was not satisfied in the present case and that the amendment could thus not be allowed.

The board in T 931/00 stated that although figures in examples might, under specific conditions, be used to limit a range which was already present in the original application, they could not be used to define an entirely new relationship between parameters which had never been linked before. Such arbitrary new links between existing parameters introduced new matter, contrary to the requirements of Art. 123(2) and Art. 100(c) EPC 1973.

The board in T 1146/01 had to answer the question of whether one measurement of a selected characteristic or property of a sample disclosed only in an individual example could be relevant to the generality of the claimed subject-matter, separately from and irrespectively of the other parameters inherent to the same sample. The situation in this case was different from the case in T 201/83. In T 201/83 an amendment was allowed on the basis of a particular value described in a specific example, provided the skilled person could readily have recognised that value as not so closely associated with the other features of the example as to determine the effect of that embodiment of the invention as a whole in a unique manner and to a significant degree. In T 1146/01, however, the board stated that formulating a new range on the basis of **individual values taken from selected examples**, which were not at all directly related to each other, meant that the reader was confronted with new information not directly derivable from the text of the application as originally filed.

In T 1004/01 the question that arose before the board was whether or not there was a basis in the application as originally filed for a peel strength "of at least 24 grams" to define the claimed laminate. According to the application as filed, the peel strength of the laminate was defined by an open-ended range as an essential feature of the invention. In the general description and the claims there was no further mention of any preferred peel

strength range. According to the board, the exemplified laminates and the peel strength thereof were disclosed only in a concrete technical context, without providing any preference for a peel strength of at least 24 grams. Nor was any such preference given in the description, which could justify the lower limit. Since, however, a peel strength of 24 grams was disclosed, the question arose as to the conditions under which such an exemplified feature could form the basis for a new range as claimed. The peel strength of 24 grams could not be detached from the exemplified laminates to form a basis for a generalised lower limit of the claimed peel strength range without taking into consideration the other particulars closely associated therewith.

In T 526/92 the patent related to an additive concentrate having a high TBN of at least 235 for incorporation in a lubricating oil composition. The application as filed contained no explicit reference to TBN apart from the examples where 235 was the lowest value mentioned. The feature "having a high TBN of at least 235" was introduced during the examination proceedings to distinguish the claimed subject-matter from compositions with low TBN values up to 100 disclosed in a citation. TBN values had not been originally disclosed as a (broad) range but only as single, punctate values; thus a new range was defined which had not been disclosed originally. Furthermore, the generic part of the original specification did not contain any information indicating that TBN played any role in the framework of the application in suit. This meant that there was also no information whatsoever concerning a TBN range, whether open-ended or not. Nor was there any information at all in the description regarding the contribution of a TBN to the solution of a technical problem. Moreover, it could not be concluded that the individual TBN values disclosed in the examples were representative of a TBN range starting at 235 and without any upper limit. The board held that if values of a parameter are only given in the examples, without the significance of this parameter becoming evident from the original specification, no range must be arbitrarily formed, which is open ended at one side and has one limit selected from the examples. This decision was approved and cited by T 931/00 – also referring to T 201/83 (OJ 1984, 481) – which concerned the creation of a new parameter range by defining its upper limit by selecting a single value from an example.

In T 343/90 the additional feature of "a viscosity of 430 to 1300 dPa.s at 165°C" was added to the claim. The board observed that the specific viscosity range could not be found *expressis verbis* either in the specification as filed or in the disputed patent as granted. However, the lower and the upper limit of the viscosity range were specifically mentioned in the examples of the application as filed. The viscosity values taken from the examples as the end-points of the viscosity range could not be seen only in the context of all the other parameters given there. Therefore, the amendment complied with Art. 123(2) EPC.

1.5.3 Setting new end-point with not expressly disclosed value

T 985/06 concerned amending the upper limit of a range, supported in the description as filed, to a new (lower) value not thus supported, by changing it from "1.05:1 to 1.4:1" to "1.05:1 to less than 1.4:1". The board acknowledged that "1.05:1 to 1.4:1" included all values within the stated range. However, the application as filed disclosed only the range in general; it did not specifically, and thus directly and unambiguously, disclose all values within it. The amendment therefore contravened Art. 123(2) EPC.

In T. 83/13 claim 1 as granted included the feature "an amount of less than 15% by weight", whereas the claim as filed and the original description had mentioned amounts of between 5% and 20% and between 8 and 15%. In the board's view, the wording "an amount of less than 15% by weight" included concentration values differing by one or more decimal places from which, depending on the precision of the measurement method or simply by applying rounding rules, the whole value of "15% by weight" could be arrived at. Replacing the concentration value of "15.0% by weight" with "an amount of less than 15% by weight" did not change the technical teaching or constitute a new technical function in relation to the claimed concentration range; from a technical perspective, the scope of protection remained the same even after the amendment (see T. 112/10). The board added that its decision was consistent with the boards' case law on novelty and rounding values (see T. 234/09 or T. 1186/05).

In T. 1986/14 claim 6 of the main request was amended by including the features "glycerin in an amount ranging from 50% to 90% by weight of the composition". The appellant argued that the amount of glycerin in claim 6 found a basis in the application as originally filed, which read "glycerin moisturizer can be present individually in an amount ranging from about 50.00% to about 90.00% by weight". The board held that it was undisputed that 50% and 50.00% differed in their accuracy. For this reason, the values 50.00% and 90.00%, on their own, could not provide a basis for the features 50% or 90%. The applicant argued, however, that the use of the term "about" in the passage mentioned above indicated that it was not intended to restrict the claimed amount to ranges defined by end-points with four significant figures. For the board, the feature "about 50.00% to about 90.00%" disclosed a range with two end-points, namely 50.00% and 90.00%, and an area of undefined boundaries around them. No other end-point, such as 50% or 50.0%, was either implicitly or explicitly disclosed. For this reason, the passage cited could not provide a basis for the afore-mentioned feature.

In T. 2203/14, the upper limit of the range relating to the thickness of the corrosion resistant layer in claim 1 as filed "approximately 5 microns" was amended to "approximately 5.0 micrometers" in view of prior art disclosing a value of 5.2. The board recalled that according to case law, when comparing a value from the state of the art with a claimed value, the state of the art value had to be given the same accuracy as the one claimed (citing T. 871/08 of 8 December 2011 and T. 175/97). Therefore, "approximately 5.0" and "approximately 5" could – in the case at issue – not have the same meaning. The application as filed consistently mentioned only the value of 5 micrometers for the corrosion resistant layer. The fact that the upper limit of another layer in the application as filed was given as 5.0 and 5 had no bearing on the value at issue since the two layers were not linked to such a degree that a certain accuracy for one layer would inevitably imply the same accuracy for the other layer. The board concluded that the amended value "approximately 5.0" was not directly and unambiguously derivable from the application as filed.

1.6. Combination of features pertaining to separate embodiments or lists

1.6.1 Combination of features pertaining to separate embodiments; application as filed is not a "reservoir"

The content of an application must not be considered to be a reservoir from which features pertaining to separate embodiments of the application could be combined in order to **artificially create a particular embodiment** (T.296/96, T.686/99, T.1206/01; T.3/06, T.1206/07, T.1041/07, T.1239/08, T.1648/11, T.1799/12, T.1853/13, T.1775/14). In the absence of any **pointer** to that particular combination, this combined selection of features does not, for the person skilled in the art, emerge clearly and unambiguously from the content of the application as filed (T.686/99, T.1853/13, T.1252/13). The fact that features in question have been mentioned in the description as "**preferred**" may act as a pointer (T.68/99, T.1869/11, T.394/11, T.1799/12; for counter-examples, see however T.2118/08 and T.1306/12).

The same applies in the case of divisional applications in respect of the earlier application as filed, see e.g. T.2118/08, T.961/09, T.1581/12; see also the reference in chapter II.E.1.1. to G.1/05 (OJ 2008, 271).

In T.1206/07 the board considered that, **in the absence of the least indication** concerning this particular combination, the selection of the two characteristics was not clearly and unambiguously evident from the application as filed. For further cases concerning an unallowable combination of features see e.g. T.659/97, T.2044/07.

In T.389/13 the composition of claim 1 was defined on filing in a broad manner, its definition including a few structural features as well as two ranges of parametric values, with an indication in the rest of the application of preferences for said structural features and a definition of additional parameters which might be used to characterise the composition, as well as corresponding ranges of values. Subsequently some limits were introduced on the basis of said preferences or on the basis of said additional parameters and corresponding ranges of values. The board emphasised that allowing those various restrictions without there being any – even implicit – indication in the application as filed that the specific combination was envisaged would be unfair to third parties. It would give an applicant who filed a broad speculative claim an unwarranted advantage over other applicants who were the first to attribute any significance to a specific combination of parameters and their ranges of values encompassed by said broad original claim.

In T.770/90 the board ruled that an unduly broad claim not supported by the description as originally filed was not a suitable "reservoir" for amendments.

According to T.1120/05, the original **drawings** cannot be considered as a reservoir of features on which the applicant or a patent proprietor can draw when amending the claims.

In T.296/96 the board stated that, when assessing whether a feature had been disclosed in a document, the relevant question was whether a skilled person would seriously

contemplate combining the different features cited in that document. That was not the case in the application as filed.

In T. 2363/10 the board held that the selection of features disclosed in six out of one hundred and forty three bullet points represented a particular selection which was not disclosed as such. The skilled person had **no hint or incentive** to choose exactly such a combination of features. The **general statement** "any such apparatus, means or method has or may have any of the following features" did not change this conclusion, since for a combination of selected elements to form a disclosure, additional information was required which directed the skilled person to this combination.

The following are examples of cases where the boards held the claimed combinations to be allowable under Art. 123(2) EPC:

In T. 1241/03 the board came to the conclusion that claims to formulations comprising compounds in specific concentrations did not need to have a literal basis in a single passage of the application as originally filed, as long as the exact concentrations and ranges claimed for the specific substances were disclosed as such in the original application. The claims did not refer to a "patchwork" of parameters disclosed in non-connected parts of the description, nor had specific values been isolated from examples in a non-allowable way. The reference in a claim to a combination of compounds in specific concentrations, explicitly disclosed in different passages of the application, was not considered by the board to be an amendment of the patent which extended beyond the content of the application as originally filed.

In T. 330/05 the board considered that the only feature added to the explicit disclosure, namely the concretisation of the polymer material, did not require any "selection" because each of the polymers listed on pages 14 -16 was clearly and unambiguously disclosed as an **appropriate alternative material**.

1.6.2 Selection from two lists – singling out a combination of features

In T. 727/00 the board held that the combination – unsupported in the application as filed – of one item from each of **two lists** of features meant that although the application might conceptually comprise the claimed subject-matter, it did not disclose it in that particular individual form. For that reason alone, claim 1 of the main request was not supported by the description and contravened Art. 123(2) EPC. See also T. 714/08 and T. 1267/11.

The board in T. 1511/07 held that although the selection of explicitly disclosed borderline values defining several (sub)ranges, in order to form a new (narrower) sub range, was not contestable under Art. 123(2) EPC when the ranges belong to the same list, the combination of an individual range from this list with another individual range emerging from a second list of ranges and relating to a different feature was not considered to be disclosed in the application as filed, **unless there was a clear pointer to such a combination** (distinguished in T. 119/15 which did not relate to lists within the meaning of T. 1511/07).

The board in T.1374/07, referring to T.811/96, said that a selection of two components (here: fat and enzymes) from one list is in fact equivalent to a twofold selection from two identical lists (see also T.2375/09, T.1506/13). Thus, applying the novelty test, the board concluded that the addition of the feature "fat and enzymes" to claim 1 infringed Art. 123(2) EPC.

In the board's view in T.686/99 the application as filed disclosed in an undifferentiated way different categories of base oils without any pointer regarding the selection of one particular category thereof. Priority was not given to ester oils from the original host of equivalent base oils. Therefore the board came to the conclusion that combining in claim 1 a base oil mandatorily comprising ester oils with the hydrofluorocarbons listed in claim 1 resulted from a multiple selection within **two lists of alternative features**, namely of ester oils from the list of base oils and of hydrofluorocarbons from the list of refrigerants, thereby generating a fresh particular combination. **In the absence of any pointer to that particular combination**, this combined selection of features did not, for the person skilled in the art, emerge clearly and unambiguously from the content of the application as filed.

In T.197/08 the board observed that the feature "FIE as the sole active ingredient" was not as such mentioned in the original application. The respondent (opponent) had argued that the introduction of "as the sole active ingredient" in combination with FIE, which was selected from a group of compounds in which it was not its most preferred active ingredient, constituted an unallowable selection from two lists. The board considered that FIE was selected from a list of six particularly preferred active ingredients and combined monotherapy (as the sole active ingredient), which constituted de facto the only administration form envisaged in the original application. Under these circumstances, the feature was not the result of two selections from different lists, as basically only one selection, i.e. the selection of FIE, had to be made in order to arrive at the feature. As a consequence, the requirements of Art. 123(2) EPC were met.

In T.783/09 the opposition division stated that the subject-matter of the claim 1 at issue was a selection from two lists and therefore contravened Art. 123(2) EPC. The board considered that the skilled person would directly and unambiguously recognise forty-four individual combinations, among them the three "basic" combinations referred to in claim 1. The board referred to the statement in decision T.12/81 (OJ 1982, 296) that if "two classes of starting substances are required to prepare end products and examples of individual entities in each class are given in two lists of some length, then a substance resulting from the reaction of a specific pair from the two lists can nevertheless be regarded for patent purposes as a selection and hence as new". The board noted that many boards had denied a direct and unambiguous disclosure for individualised subject-matter that was only derivable from a document by combining elements from lists. However, given the term "can" in the citation from decision T.12/81, the absence of a direct and unambiguous disclosure for individualised subject-matter was not a mandatory consequence of its presentation as elements of lists. Thus, the "disclosure status" of subject-matter individualised from lists had to be determined according to the **circumstances of each specific case** by ultimately answering the question whether or not the skilled person would clearly and unambiguously derive the subject-matter at issue from the document as a whole.

In T. 1710/09 the board insisted, however, that, in line with established jurisprudence, "can" within the meaning of T. 12/81, was to be taken as a "is to". In view of the implications of freely interpreting this word "can" as in T. 783/09, there was deep concern that in this way the uniformity of the disclosure assessment process could not be warranted.

In T. 236/08 the feature "suitable for administration by inhalation" in claim 1 was not present in the claims as originally filed. A basis for this feature could however be found as part of a list in the description, where it was one way among different possible ways of administration. A consequence was however that the combination of the subject-matter of claim 1 with the subject-matter of any dependent claim which also resulted from a selection among different possibilities would constitute an unallowable selection from multiple lists. For example, the subject-matter of dependent claim 10 related to a singling out from a list of possibilities concerning specifically the use of insulin. Therefore, its combination with the subject-matter of claim 1, which resulted similarly from a selection of possible ways of administration, constituted a selection from multiple lists and had no basis in the application as originally filed.

In T. 714/08 claim 1 of the main request had been amended so as to limit the first oxidation base to paraphenylenediamine and the list of couplers to 12 compounds, but the specific combination of paraphenylenediamine with each of those couplers could not be derived directly and unambiguously from the application as filed. The case differed from those concerning restrictions applied to lists of substituents in **Markush-type chemical formulas** (see T. 615/95 or T. 50/97); the restrictions there had not resulted in singling out particular combinations but had retained the generic nature of the chemical formula defining the claimed products.

In case T. 209/10 the appellant (patent proprietor) alleged that claim 1 did not concern an unallowable selection but merely the deletion of some option(s) from one list. The board considered that the application as originally filed disclosed the technical effect of prevention of bone loss, which was not identical to the prevention of post-menopausal osteoporosis in a post-menopausal woman as described in claim 1 as granted. Post-menopausal women were selected from a list of several possible options for the patients to be treated. A further selection also took place in claim 1, namely that concerning the form of the medicament as a tablet or capsule. The oral route did not equate with the selection of tablets and capsules since other forms such as solutions and suspensions might also be possible. Moreover, the patient was identified as an aging human and there was no preference for post-menopausal women to be linked to a particular dosage form. The board concluded that claim 1 included technical information which was not directly and unambiguously derivable from the application as originally filed and singled out subject-matter which was not disclosed in an individualised manner in the application as originally filed.

In T. 407/10 the board at first concurred with the appellant that, whereas the combination of e.g. two features only originally disclosed in **lists of equivalent alternatives** was normally found to violate Art. 123(2) EPC, there might be other combinations of features which although not explicitly disclosed in the application as filed were nevertheless derivable from the presence of an (explicit or implicit) **pointer** thereto. For instance, the

fact that certain features were disclosed as preferred in the original application acted as a pointer for the skilled person, as the combination of preferred features was obviously the best way of achieving the technical effects that the invention aimed to provide (see e.g. [T 68/99](#)). However, this jurisprudence did not consider the combination of a feature not originally disclosed as preferred with a plurality of further restrictions based on preferred features as an amendment in accordance with [Art. 123\(2\) EPC](#).

In [T 1799/12](#) the board considered that the jurisprudence and [T 407/10](#) correctly referred to further circumstances that need to be taken into account, such as **pointers** to that selection or combination in the description and in the examples, for instance the fact that the features in question have been mentioned in the description as "**preferred**". Further, the circumstance that the list consists of **equivalent alternatives** could also play a role (see in particular [T 686/99](#)). In the case at issue, no pointer was available towards the choice of a square or rectangular base wall shape, but there was a clear pointer in the opposite direction, namely towards base wall shapes without any corners ("generally circular" or "oval"). By the same token, the five possible shapes mentioned in the parent application were not equivalent alternatives. The possible conditions in favour of allowing the currently claimed selection were therefore not fulfilled.

In [T 45/12](#) the board considered that the specific combination of pioglitazone with glimepiride was singularised in the root application as filed. All through the description of the root application as filed pioglitazone was disclosed as the **most preferred** sensitivity enhancer to be used in combination with another antidiabetic agent. Glimepiride was one specific antidiabetic agent disclosed for use as second component in the composition. Thus, even assuming that the composition containing pioglitazone with glimepiride would require a selection (among the specific antidiabetic agents disclosed to be combined with pioglitazone), this **one-dimensional selection** did not introduce added subject-matter.

In [T 2273/10](#) the appellant (patent proprietor) argued that claim 1 was a combination of the invention's most preferred features, and did not involve a selection from various lists. The board disagreed. The application as filed disclosed several possibilities for each of the three features. To arrive at the claimed wording, the skilled person had to make a selection from various lists. In addition these **selections related to preferred and non-preferred features**. Similarly, in [T 1150/15](#) the board rejected the proprietor's approach to combine the preferred options for each of the substituents Y, X and Z disclosed on page 75, to **disregard the preferred option** for R^B disclosed in the same context and to combine it with a definition which has been singled out of the most general list of options for substituent A as **arbitrary**. The board distinguished its case from the facts underlying [T 615/95](#) (see chapter [II.E.1.6.3](#) below).

In [T 1032/12](#) the board rejected the appellant's argument that the claimed polypeptide was defined by two features selected from **two independent lists**. For the appellant (opponent) the term "preferred polypeptides" encompassed a list of possible polypeptides. The board considered that, in the case at issue, the protein of SEQ ID NO:2 was singled out as the **particularly preferred polypeptide**, and when reference to fragments as the preferred sequences was made, they were always labelled as "particularly preferred fragments". Therefore, the reference in the description to "the preferred polypeptide" was

a reference to the polypeptide of SEQ ID NO:2. It was this specific mention of the full-length molecule as the particularly preferred molecule that distinguished the case at issue from the case underlying decision T 583/09, referred to by the appellant, where different molecules had been presented as equivalent alternatives. Art. 123(2) EPC was not infringed.

According to the board in T 2134/10, there was no combination of independent features from two lists. The board found that a specific **degree of sequence identity** (in claim 1(d): "at least 95%") is not a property that, in combination with a particular molecule selected from Table 1 (disclosing 113 open reading frames encoding potentially antigenic peptides of *S. pneumoniae*), could single out a particular molecule or confer properties to the claimed subject matter not directly and unambiguously derivable from the application as filed.

In T 1581/12 claim 1 was directed to a combination of sequences SEQ ID NO 4, 6 with fragment length of "20 or more consecutive amino acids", and a selection of those fragments containing an epitope of these sequences. In the parent application, sequences SEQ ID NO 4, 6 were disclosed as members of a list of several hundred sequences. Likewise, the fragment length indicated in claim 1 was disclosed in the parent application within a long list of lengths to be selected "depending on the particular sequence". The board observed that the case law referred to by the appellant (opponent) (T 583/09, T 2134/10) was exclusively concerned with a combination of specific members from two, fully independent lists, where the combination of one member of one list with another member of the other list, in the absence of a clear pointer to such a combination, was considered to create new subject-matter. However, the present situation was different. The values of the fragment length disclosed in the parent application would be understood by a skilled person to apply to each and every member of the list of disclosed amino acid sequences (SEQ ID NOs), wherein the upper length of these fragments varied "depending on the particular sequence"; the list of fragment lengths was actually **not independent** from the list of amino acid sequences. The combination of the value "20 or more consecutive amino acids" with the amino acid sequences SEQ ID NOs 4, 6, therefore only limited the original disclosure in the parent application. This limitation did not create new subject-matter.

In T 1259/16 the claimed combination of the features characterising the claimed solution – "free of free bromine" and "less than 100 ppm of metal ion impurities" – was not explicitly disclosed in the application as filed. The board considered that the **lists** relating to free bromine levels and metal ion impurities were **fully independent**. The various levels of free bromine and metal ion impurities represented **equally suitable alternatives**. The skilled person reading the application would not recognise that the lower values were necessarily more preferred, as reducing impurities to as low a level as possible was both impractical and uneconomical. The claimed combination was therefore contrary to Art. 123(2) EPC.

1.6.3 Deletion of elements from lists – shrinking the lists without singling out a combination of features

According to the boards' consistent case law, the guiding principle is that deleting meanings of residues in a generic chemical formula must not lead to the selection, in the respective lists, of a particular combination of single, specific but originally undisclosed meanings of residues (see T 615/95 and T 859/94).

In T 615/95 there were three independent lists of sizeable length specifying distinct meanings for three residues in a generic chemical formula in a claim. One originally disclosed meaning was deleted from each of the three independent lists. The board stated that the present deletions did not result in singling out a particular combination of specific meanings, i.e. any hitherto not specifically mentioned individual compound or group of compounds, but maintained the remaining subject-matter as a generic group of compounds differing from the original group only by its smaller size. Such a **shrinking of the generic group** of chemical compounds was not objectionable under Art. 123(2) EPC 1973, since these deletions did not lead to a particular combination of specific meanings of the respective residues which was not disclosed originally or, in other words, did not generate another invention. See also T 948/02, which refers in detail to this case law and which did not allow the amendment of a generic chemical formula. For another decision distinguishing its case from T 615/95, see T 1150/15; see also T 894/05, T 888/08).

In T 50/97 the board explained that in the case at issue the shrinking of the lists of alternative definitions disclosed in the application as filed was not objectionable as that limitation did not result in singling out a particular combination of specific definitions, i.e. a hitherto not specifically mentioned sub-class of compounds, but maintained the remaining subject-matter of claim 1 as generic lists of alternative definitions differing from the original lists only by their smaller size (with reference to T 615/95 and T 859/94).

In T 942/98 the board held that, through the **deletion of all other meanings**, residues X1, X2 and R5 had been narrowed down to a single meaning, leading to a combination of specific meanings of residues not disclosed in the application as filed. Consequently, claim 1 as filed did not in itself provide adequate support for claim 1 as amended (cited by T 2013/08 in connection with the established case law concerning "**singling out**").

In T 1506/13 the board, referring to T 948/02, summarised that a deletion of genes from a **list of specific genes** was allowable if it fulfils **two conditions**: First, the deletion must not result in singling out any hitherto not specifically mentioned individual compound or group of compounds, but maintains the remaining subject-matter as a generic group of compounds differing from the original group only by its smaller size. Second, the deletion does not lead to a particular combination of a specific meaning which was not disclosed originally, i.e. it does not generate another invention, or in other words it merely restricts the required protection but does not provide any technical contribution to the originally disclosed subject-matter.

In T 98/09, which concerned the "singling out" of combinations of active ingredients not originally disclosed from lists, the board held that, contrary to the appellant's view, a deletion from a list could also constitute an inadmissible extension if the singling out of one individual ingredient led to a selection of combinations which, even if conceivably covered by the application as filed, had not been specifically disclosed. It was the boards' settled case law that such a selection is to be regarded as an inadmissible extension and so as an infringement of Art. 123(2) EPC (see e.g. T 727/00 and T 686/99). The case at issue concerned two lists (six elements and 47 elements). The applicant sought to individualise one of the lists to one element. The board held that this selection was contrary to Art. 123(2) EPC. For a similar case, in which the board found that the deletion of elements of two lists led to an unallowable selection, see T 1808/08.

In T 10/97 not all the compounds listed in the original claim were included in amended claim 1. However, since the claimed group of compounds was obtained not by restricting an originally disclosed generic definition of a substituent in a generic formula to a specific one selected from worked examples, but by **deleting some members from a list** of individualised equally useful compounds in order to improve the chances of patentability over the available prior art, the board found that such deletions must be considered admissible in accordance with the case law of the boards of appeal (see T 393/91). For the remaining compounds, no particular technical effect was either disclosed or alleged.

In T 783/09 the board referred to T 10/97. All forty-four combinations resulting from the combination of the elements of the two lists (one list with two elements, the other list with 22 elements) were directly and unambiguously disclosed. However, a further issue was whether or not the claiming of only three of the forty-four combinations disclosed extended the content of the application as filed in an unallowable way. The forty-four combinations were referred to as "very preferred embodiments"; by this statement the skilled person was taught that each of the forty-four combinations had the same quality, i.e. they were all very preferred combinations in the context of the invention. Nothing else was derivable from the remainder of the application, i.e. a particular quality, for example a particular technical effect, was attributed neither to the three combinations of claim 1 nor to the remaining forty-one. Hence, the group of combinations in claim 1 could not be considered as the result of a selection of three qualitatively equal elements from a list of forty-four qualitatively non-equal elements – for which selection there would be no hint in the application as filed and the claiming of which group therefore would have to be considered as adding matter. Rather the group of claim 1 was to be considered as the result of the **deletion of forty-one elements from a list of forty-four qualitatively equal elements** (see T 10/97). In summary, the subject-matter of claim 1 complied with the requirements of Art. 123(2) EPC.

In T 2273/09 the appellants argued that the same reasoning and conclusion of T 783/09 applied to the case at issue, which related to the deletion of ten of sixteen directly and unambiguously disclosed individual combinations, with six combinations then remaining. The board referred to G 2/10 where it was held that whether the skilled person was presented with new information depended on how he or she would understand the amended claim. Applying the technical assessment of the case under consideration with

regard to the remaining subject-matter claimed, the board held that the subject-matter of the main request under consideration did not meet the requirements of Art. 123(2) EPC.

In T 1075/12 the patent proprietor restricted the definitions of groups to lists of specific substituents. The board held that the more precise definitions of the groups did not result in a particular combination of specific meanings of the respective groups being singled out, namely no particular structural feature of the compounds concerned was now claimed which was not disclosed originally. The board distinguished its case from T 859/04 and T 801/02, in which more than one variable in the respective chemical formulae had been individualised, leading to a particular combination of specific meanings of the respective residues, i.e. to a particular structural feature of the compounds concerned which was not originally disclosed.

1.7. Disclaimer

1.7.1 Definition

The term "disclaimer" is used in the decisions G 1/03 (identical to G 2/03) (OJ 2004, 413, 448), G 2/10 (OJ 2012, 376) and G 1/16 (OJ 2018, A70) as meaning an amendment to a claim resulting in the incorporation therein of a "negative" technical feature, typically excluding from a general feature specific embodiments or areas.

Furthermore G 1/16 concurred with decision T 1870/08, that a disclaimer is only a proper disclaimer if the remaining legal subject-matter is **less** than that of the unamended claim. If any subject-matter can be identified which falls within the scope of the claim after amendment by the proposed disclaimer, but which did not do so before the amendment, the disclaimer is improper and, as a consequence of this, unallowable under Art. 123(2) EPC.

The board in T 1870/08 provided the example of a negative formulation removing a restricting feature: While this formulation may look like a disclaimer, it may in fact extend the legal scope of protection.

The term "**undisclosed disclaimer**" relates to the situation in which neither the disclaimer itself nor the subject-matter excluded by it have been disclosed in the application as filed. The term "**disclosed disclaimer**" relates to the situation in which the disclaimer itself might not have been disclosed in the application as filed, but the subject-matter excluded by it has a basis in the application as filed, e.g. in an embodiment. Thus, undisclosed disclaimers and disclosed disclaimers can be distinguished according to whether the subject-matter on which the respective disclaimer is based is explicitly or implicitly, directly and unambiguously, disclosed to the skilled person using common general knowledge, in the application as filed (G 1/16).

1.7.2 Standards for examining disclosed and undisclosed disclaimers

In G 1/16 (OJ 2018, A70) the Enlarged Board considered that the choice of the proper test for assessing the allowability of any disclaimer is determined by the fundamental

distinction, in terms of their legal nature, between disclosed disclaimers and undisclosed disclaimers. That distinction necessitates providing **for each of the two classes of disclaimer a single specific test** for assessing whether the introduction of a given disclaimer is in compliance with Art. 123(2) EPC. Therefore, for undisclosed disclaimers the proper test is whether the criteria of G 1/03 (OJ 2004, 413) are fulfilled, and for disclosed disclaimers the proper test is the gold standard disclosure test of G 2/10 (OJ 2012, 376).

With regard to the admissibility of disclaimers, reference should also be made to chapter II.D.3.1.2.

a) Principles established in G 1/03 and G 2/03 for undisclosed disclaimers

The Enlarged Board of Appeal held in G 1/03 and G 2/03 (OJ 2004, 413 and 448) concerning **undisclosed** disclaimers that an amendment to a claim by the introduction of a disclaimer may not be refused under Art. 123(2) EPC 1973 for the sole reason that neither the disclaimer nor the subject-matter excluded by it from the scope of the claim have a basis in the application as filed. It considered that the following criteria were to be applied for assessing the allowability of a disclaimer which was not disclosed in the application as filed:

A disclaimer may be allowable in order to:

- restore novelty by delimiting a claim against state of the art under Art. 54(3) and (4) EPC 1973;
- restore novelty by delimiting a claim against an accidental anticipation under Art. 54(2) EPC 1973; an anticipation is accidental if it is so unrelated to and remote from the claimed invention that the person skilled in the art would never have taken it into consideration when making the invention; and
- disclaim subject-matter which, under Art. 52 to 57 EPC 1973, is excluded from patentability for non-technical reasons.

In addition, a disclaimer should not remove more than is necessary either to restore novelty or to disclaim subject-matter excluded from patentability for non-technical reasons. On the other hand, a disclaimer which is or becomes relevant for the assessment of inventive step or sufficiency of disclosure adds subject-matter contrary to Art. 123(2) EPC 1973. And a claim containing a disclaimer must meet the requirements of clarity and conciseness of Art. 84 EPC 1973.

In G 1/03 (and G 2/03), the Enlarged Board, having regard to the law established by it in relation to disclaimers, expressly identified those board decisions which should no longer be applied. Thus, the Enlarged Board stated that the isolated decisions T 170/87 and T 313/86 were not to be followed, whilst also criticising T 323/97 in the light of the new law applicable.

b) Principles established in G 2/10 for disclosed disclaimers

The Enlarged Board in G 2/10 found that, subsequent to decision G 1/03 (and G 2/03), different opinions had been expressed in the jurisprudence of the boards of appeal on whether decision G 1/03 related to the disclaiming of embodiments which were **disclosed** as part of the invention in the application as filed or whether in that situation the jurisprudence as previously established following decision T 4/80 (OJ 1982, 149) continued to apply (see G 1/07, OJ 2011, 134, point 4.2.3 of the Reasons). In G 2/10 the Enlarged Board reformulated the question referred to it, stating that the question was construed as intending to ask whether an amendment to a claim by the introduction of a disclaimer infringes Art. 123(2) EPC if the subject-matter of the disclaimer was disclosed as an embodiment of the invention in the application as filed.

The Enlarged Board in G 2/10 stressed that decision G 1/03 did not support the conclusion drawn by T 1050/99 that G 1/03 also related to disclaimers for disclosed subject-matter. Further, in G 1/03 it was not decided that an undisclosed disclaimer would be always allowable under Art. 123(2) EPC. The wording of its answer, reading "a disclaimer may be allowable", indicated that with the criteria established in this answer the Enlarged Board in G 1/03 did indeed not intend to give a complete definition of when a disclaimer violates Art. 123(2) EPC.

The Enlarged Board stated that neither decision G 1/93 nor decision G 1/03 intended to modify the general definition of the requirements of Art. 123(2) EPC established in opinion G 3/89 (OJ 1993, 117) and decision G 11/91 (OJ 1993, 125), which definition has become the generally accepted or "gold standard" for assessing any amendment for its compliance with Art. 123(2) EPC. As to the criteria to be applied, the principle that any amendment to an application or a patent, and in particular to a claim, must fulfil the requirements of Art. 123(2) EPC also applies to an amendment limiting the claim by disclaiming disclosed subject-matter. Therefore, as is the case for any other amendment, the test for an amendment to a claim by disclaiming subject-matter disclosed as part of the invention in the application as filed must be that after the amendment the skilled person may not be presented with new technical information. Hence, disclaiming subject-matter disclosed in the application as filed can also infringe Art. 123(2) EPC if it results in **the skilled person being presented with technical information** which he would not derive directly and unambiguously, using common general knowledge, from the application as filed.

The point of reference for assessing an amended claim for its compatibility with Art. 123(2) EPC is the subject-matter which the claim contains after the amendment. In other words, it is the subject-matter remaining in the claim after the amendment. The test to be applied is whether the skilled person would, using common general knowledge, regard the **remaining claimed subject-matter as explicitly or implicitly, but directly and unambiguously, disclosed in the application as filed**. This test is the same as that applied when the allowability of a limitation of a claim by a positively defined feature is to be determined. The Enlarged Board found that no convincing reason had been advanced for not applying the principles developed in the context of Art. 123(2) EPC for the assessment of amendments to claims by the introduction of positive limiting features in the same manner to limitations of claims by disclaimers which disclaim subject-matter

disclosed in the application as filed. The Enlarged Board stressed in its decision **the importance of applying a uniform concept of disclosure** (with reference to Art. 54, 87 and 123 EPC; see G 2/10, point 4.6 of the Reasons, citing G 1/03, OJ 2012, 436).

The Enlarged Board in G 2/10 (OJ 2012, 376) answered the two questions referred to it by interlocutory decision in T 1068/07 (OJ 2011, 256) as follows:

(1) An amendment to a claim by the introduction of a disclaimer disclaiming from it subject-matter disclosed in the application as filed infringes Art. 123(2) EPC if the subject-matter remaining in the claim after the introduction of the disclaimer is not, be it explicitly or implicitly, directly and unambiguously disclosed to the skilled person using common general knowledge, in the application as filed.

(2) Determining whether or not that is the case requires a technical assessment of the overall technical circumstances of the individual case under consideration, taking into account the nature and extent of the disclosure in the application as filed, the nature and extent of the disclaimed subject-matter and its relationship with the subject-matter remaining in the claim after the amendment.

According to T 1676/08, the principles set out in decision G 2/10 with regard to the requirements to be met in order for amendments by the introduction of disclaimers for disclosed subject-matter to be allowable under Art. 123(2) EPC also apply with regard to the requirements for **divisional applications** under Art. 76(1) EPC; they also apply to the examination under Art. 100(c) EPC.

As in G 1/03 (and G 2/03), the Enlarged Board in G 2/10 identified board decisions which should no longer be applied. Thus, it criticised the approach taken in T 1050/99 and T 1102/00.

c) Explanations in G 1/16

In the case law that followed these decisions of the Enlarged Board of Appeal there was no uniformity of approach regarding the application of G 2/10 to "undisclosed disclaimers" (see Case Law of the Boards of Appeal, 8th ed. 2016, II.E.1.5.2(b) and the summary in G 1/16, point 24 of the Reasons). This led to the referring decision T 437/14 asking in particular whether the standard referred to in G 2/10 for the allowability of disclosed disclaimers under Art. 123(2) EPC, i.e. whether the skilled person would, using common general knowledge, regard the subject-matter remaining in the claim after the introduction of the disclaimer as explicitly or implicitly, but directly and unambiguously, disclosed in the application as filed, was also to be applied to claims containing undisclosed disclaimers.

In G 1/16 (OJ 2018, A70) the Enlarged Board considered that the choice of the proper test for assessing the allowability of any disclaimer is determined by the fundamental distinction, in terms of their legal nature, between disclosed disclaimers and undisclosed disclaimers. That distinction necessitates providing **for each of the two classes of disclaimer a single specific test** for assessing whether the introduction of a given disclaimer is in compliance with Art. 123(2) EPC. Therefore, for undisclosed disclaimers

the proper test is whether the criteria of G 1/03 (OJ 2004, 413) are fulfilled, and for disclosed disclaimers the proper test is the gold standard disclosure test of G 2/10 (OJ 2012, 376).

The assessment of the allowability of a claim amendment by an undisclosed disclaimer is governed exclusively by the criteria laid down in G 1/03. No modifications are to be made to, nor any conditions added which go beyond, the criteria of G 1/03.

The Enlarged Board confirmed that an amendment by an undisclosed disclaimer may be allowable in the three situations mentioned in G 1/03 (point 2.1 of the Order), i.e. in order to (1) restore novelty by delimiting a claim against state of the art under Art. 54(3) EPC; (2) restore novelty by delimiting a claim against an accidental anticipation under Art. 54(2) EPC; or (3) disclaim subject-matter which, under Art. 52 to 57 EPC, is excluded from patentability for non-technical reasons.

In addition, the undisclosed disclaimer must not be related to the teaching of the invention, as already held in G 1/03 (point 2.3 of the Order; point 2.6 of the Reasons). In endorsing this concept, the Enlarged Board provided the following explanations:

The question to be asked in this context is not whether an undisclosed disclaimer quantitatively reduces the original technical teaching – this is inevitably the case – but rather whether it **qualitatively changes** it in the sense that the applicant's or patent proprietor's **position with regard to other requirements for patentability** is improved. If that is the case, then the original technical teaching has been changed by the introduction of the disclaimer in an unallowable way. And as a consequence, the technical teaching based on the amended claim, i.e. on the remaining subject-matter without the disclaimer, can no longer be considered as belonging to the invention as presented in the application as originally filed.

For the sake of completeness, the Enlarged Board added that the prohibition of a qualitative change in the original teaching applies in an absolute way, i.e. not only with regard to the prior art which provides the basis for the undisclosed disclaimer, but also to the entire prior art relevant for the assessment of inventive step. In practical terms, this means that the evaluation of inventive step has to be carried out disregarding the undisclosed disclaimer, as proposed in T 710/92. In this way, any unallowable modification of the original technical teaching in the assessment of inventive step is avoided.

The Enlarged Board concluded that the introduction of an undisclosed disclaimer must fulfil one of the criteria laid down in point 2.1 of the Order of decision G 1/03, but may not provide a technical contribution to the claimed subject-matter of the application as filed; in other words, the identity of the invention as originally filed must remain unchanged by the subject-matter remaining in the claim after the introduction of the undisclosed disclaimer.

The Enlarged Board answered the questions referred to it as follows:

For the purpose of considering whether a claim amended by the introduction of an undisclosed disclaimer is allowable under Art. 123(2) EPC, the disclaimer must fulfil one of the criteria set out in point 2.1 of the Order of decision G 1/03.

The introduction of such a disclaimer may not provide a technical contribution to the subject-matter disclosed in the application as filed. In particular, it may not be or become relevant for the assessment of inventive step or for the question of sufficiency of disclosure. The disclaimer may not remove more than necessary either to restore novelty or to disclaim subject-matter excluded from patentability for non-technical reasons.

1.7.3 Decisions applying the criteria established by the Enlarged Board in G 1/03 and G 1/16

a) Accidental anticipation

In G 1/03 (OJ 2004, 413) the Enlarged Board held that, when anticipation was taken to be accidental, this meant that it appeared from the outset that the anticipation had **nothing to do with the invention**. Only if this was established could the disclaimer be allowable (see also order in G 1/03, according to which an anticipation is accidental if it is so unrelated to and remote from the claimed invention that the person skilled in the art would never have taken it into consideration when making the invention).

In T 500/00 the amendment was an undisclosed disclaimer introduced by the appellant into claim 1 during the examining proceedings in response to an objection of lack of novelty based on prior art document D1. The question that arose was whether or not the disclosure of D1 was accidental. In the case in point, the claimed solution showed an overlap with the teaching of D1. D1 and the application in suit concerned the same technical field, had, except for the disclaimed component, identical compositions and related to the same purpose of sufficient curing. Moreover, the same technical problem underlay both the patent in suit and D1. Since the skilled person would consider D1 as suitable prior art to make the invention, confirmed by the reference to D1 in the original application, the disclosure of D1 could not be considered as being accidental within the meaning of G 1/03. Furthermore, since D1 related to the same technical effect as the patent in suit, and since its starting polymers to be cured were structurally identical to those used in the claimed process, D1 could be considered as a suitable starting point for assessing inventive step.

The decision in T 14/01 concerned the allowability of a disclaimer aimed at removing an overlap with prior art in view of G 1/03. According to the board in this case, the allegation that a teaching extracted from prior art led away from the invention implied that the skilled person had taken this prior art into consideration. Yet for an anticipation to be accidental it was necessary that the skilled person would have never taken it into consideration. The board then decided that the prior art in question was not accidental in the sense of G 1/03, and that the disclaimer was not admissible.

In T. 1297/12 document D3 itself was not unrelated and remote since it related to the same field as the patent in suit. However the appellant/patent proprietor argued that the specific novelty destroying disclosures in D3 were "unrelated and remote". The board cited T. 14/01 and held that the fractions were disclosed in a **relevant document**, D3, and so could not be considered to represent an "accidental" disclosure. Thus, based on this assessment alone a disclaimer in respect of these disclosures would not be allowable. Even if one were, for the sake of argument, to follow the position of the appellant, the conclusion would be the same because the specific disclosures in question could not be considered to constitute remote or unrelated disclosures.

In T. 1049/99 the board concluded that, contrary to what the respondent (patent proprietor) claimed, the skilled person would have taken the teaching of document D21 into consideration when working on the invention in search of a solution to the technical problem defined by the respondent, using appropriate and relevant means to resolve his problem **in the same technical field** as that of the patent in suit. Moreover, contrary to the respondent's conclusions at the hearing, the board stressed that the fact that a document was difficult to find in published prior art or was difficult for the skilled person to access was not sufficient to justify the conclusion that it constituted an accidental anticipation.

In T. 217/03, on the issue of whether document D1 was an accidental anticipation, the board stated that D1 did not deal explicitly with the technical problem underlying the claimed invention. However, that was not decisive for accepting D1 as an accidental anticipation. The board concluded that D1 related to the same general technical field as that of the subject-matter of claim 10 and was not from a technical point of view so unrelated and remote that the person skilled in the art would never have taken it into consideration when working on the invention (see G. 1/03, OJ 2004, 413). Thus the disclosure of D1 could not be considered to constitute an accidental anticipation. Therefore the disclaimer in claim 10 did not fulfil the conditions required to render it admissible.

In T. 1146/01 the board held that comparative examples of D1, although teaching what not to do, nevertheless served to elucidate the teaching of the document as a whole and were closely related to the other experiments disclosed in the document. Although it could be said that a comparative example had a "negative relevance", it was neither remote from nor unconnected from the disclosure in the document. Thus, although the comparative examples of D1 provided a teaching not to be followed, this did not mean that their information was not part of the disclosure of D1 or would not be considered by an inventor working on his invention.

Other decisions too have had to establish whether or not the anticipation was accidental. In T. 717/99, for example, the board did not agree with the opponent's conclusion that the anticipation was not accidental. In the following decisions, the boards ruled that the anticipation was not accidental and that the disclaimers were therefore inadmissible: T. 1086/99, T. 584/01, T. 506/02, T. 285/00, T. 134/01 (field of pharmaceuticals, same illness; findings summarised by the board in T. 1911/08, in which account was also taken of T. 739/01, T. 580/01 and T. 639/01), T. 351/12, T. 632/12.

b) Drafting of disclaimers – disclaimer shall not remove more than is necessary

Regarding the drafting of disclaimers, the Enlarged Board of Appeal stated in G 1/03 and G 2/03 (OJ 2004, 413 and 448) and confirmed in G 1/16 (OJ 2018, A70) that the disclaimer should not remove more than was necessary to restore novelty or to disclaim subject-matter excluded from patentability for non-technical reasons. The need for a disclaimer was not an opportunity for the applicant to reshape his claims arbitrarily. In G 2/10 (OJ 2012, 396) the Enlarged Board held that the requirement that "the disclaimer should not remove more than is necessary to restore novelty" was not suitable for the disclaiming of disclosed subject-matter, since in that case the wording of the disclaimer must be configured in accordance with the disclosure of the disclaimed subject-matter in the application as filed.

As to the relationship between the requirement that "the disclaimer should not remove more than is necessary to restore novelty" and the requirement of clarity and conciseness, see T 2130/11 (summarised in chapter II.E.1.7.3.e) "Drafting of disclaimers – clarity" below).

In T 747/00 the board concluded that since, in the absence of a novelty-destroying disclosure in document (5), the disclaimer removed subject-matter without any need to do so, that disclaimer necessarily removed more than was necessary to restore novelty, which was not allowable (see also T 201/99). In T 1050/99 the board concluded that the disclaimer covered more than was disclosed in the prior art and thus removed from the claim more than was necessary to restore novelty. See also T 285/00 which concerned a disclaimer largely not based on the disclosure of a prior art document cited under Art. 54(3) EPC 1973, thereby rendering the remaining claimed subject-matter more distant from a relevant prior art document cited under Art. 54(2) EPC 1973.

In T 8/07 the board observed that G 1/03 had stated that a disclaimer may serve exclusively the purpose for which it is intended and nothing more. If a disclaimer had effects which went beyond its purpose, it was or became inadmissible. Further, the necessity for a disclaimer was not an opportunity for the applicant to reshape his claims arbitrarily (G 1/03, point 3 of the Reasons). Therefore the disclaimer should not remove more than was necessary to restore novelty or to disclaim subject-matter excluded from patentability for non-technical reasons. From that the board found that it could not be derived from the reasoning of G 1/03 that a patent proprietor was permitted a degree of **discretion or latitude** concerning the "border" within which the disclaimer should be drafted with respect to the subject-matter to be excised. On the contrary, the existence of any discretion regarding the extent of the disclaimer as compared to the subject-matter to be excluded would inevitably introduce a degree of arbitrariness in the drafting of the disclaimer. This would conflict with the express findings of G 1/03. It was therefore concluded that in order to comply with the requirements following from G 1/03 with respect to the drafting of disclaimers it was necessary that these be formulated to excise only that subject-matter which could not be claimed. Further, the submission of the patent proprietor that it would derive no advantage was not necessarily and inevitably correct since a broad disclaimer, in addition to restoring novelty would have the further effect of "immunising" the subject-matter claimed against a potential attack of lack of novelty.

In T.10/01 the scope of the disclaimer was broader than was necessary to restore novelty. The board nevertheless referred to point 3 of the Reasons for G.1/03, saying that it could also be inferred from that decision that a disclaimer that was broader than strictly necessary to restore novelty might be allowed, depending on the circumstances of the case, if that proved necessary to prevent any lack of clarity in the claim that might otherwise result. However, in the case at issue there was no apparent justification for the disclaimer being broader than the disclosure in document (1).

In T.477/09 claim 1 was modified by addition of a disclaimer with a view to restoring its novelty over document D1. It was undisputed that there was no basis for the disclaimer in the application as filed. The board observed that two conditions relating to the wording of disclaimers had been established in points 2.2 (disclaimer should not remove more than is necessary) and 2.4 (clarity and conciseness) of the Order made in G.1/03 and that those two conditions were equally applicable. The patent proprietor therefore could **not** be considered to have any **room for manoeuvre** in wording the disclaimer and thereby defining its scope: to satisfy the conditions set out in G.1/03, a disclaimer could not remove more than was necessary to restore novelty. In the case at hand, the board found that the scope of the disclaimer was greater than the actually novelty-destroying disclosure in D1.

In T.1843/09 (OJ 2013, 502) the opponent argued that the disclaimer contravened Art. 123(2) EPC because the wording of the disclaimer that the claimed film "is other than a film of Comparative Example 4 of EP-A 0546184" did **not represent a technical feature**. The board did not accept this argument. Although it was true that technical information could not directly be extracted from the wording of the disclaimer as such, it should be noted that the disclaimer did not merely cite a published patent document, but clearly referred to a specific disclosure in D15, namely a single film described in comparative example 4. Table 4 of D15 characterised this film unambiguously by a number of technical features. The skilled person was therefore able to determine simply by reading the comparative example in D15 which technical embodiment should be excluded from the scope of the claim.

In T.1836/10 the examination division had based its refusal of the application on Art. 53(a) in conjunction with R. 28(c) EPC. The applicant attempted to disclaim the relevant subject-matter. The board considered that an applicant could not amend his claims at will, and that any disclaimer needed should not exclude any more than was necessary to disclaim subject-matter excluded from patentability for non-technical reasons. The same applied to a disclaimer which served to disclaim subject-matter that was not comprised by the claim in the first place.

The board in T.1224/14 found that a disclaimer was no longer needed to restore novelty over the prior-art example 5A of D1 because the example had become irrelevant for novelty purposes following a limitation of the claimed subject-matter. The disclaimer thus removed more than was necessary to restore novelty and was therefore at odds with the decision in G.1/03.

In T.1354/15 the appellant had argued that, since the disclaimer at issue specified not merely the specific L-dsRNA sequence disclosed in D7, but also the C18 linker group

between the two strands, it removed more than was necessary to restore novelty. In the board's view however, the RNA described in D7 was characterised also by the C18 linker. The fact that the application as filed did not contemplate such linkers did not result in the skilled person being presented with new technical information. Excluding the specific RNA having a C18 linker did not provide any technical contribution to the subject-matter disclosed in the application as filed.

c) Drafting of disclaimers – disclaimer shall not remove less than is necessary

In case **T 440/04** the question was whether disclaiming example 1 of C63 was sufficient to restore novelty. Whereas on the one hand a disclaimer should not remove more than was necessary to restore novelty, it cannot, on the other hand, be considered to serve its intended purpose when it **excises less** than what is necessary to restore novelty. The disclosure in C63 of fibres having compositions and properties as required by the present claims 1 according to all requests was not limited to the fibres described in example 1 of C63. "Cutting out" the latter fibres was thus not sufficient to exclude from the said claims 1 all those fibres disclosed in C63 having a composition and the inherent properties according to said claims.

d) Drafting of disclaimers – delimitation against any potential prior art

In **T 285/03** the board found that the interpretation offered by the appellant amounted to a disclaimer although it was not phrased in the usual form. However, that disclaimer was not based on a particular prior art disclosure, whether accidental or not, but tried to delimit the claim against any **potential prior art** disclosure, contrary to the principles set out in **G 1/03**.

e) Drafting of disclaimers – clarity

The Enlarged Board of Appeal stated in **G 1/03** and **G 2/03** (OJ 2004, 413 and 448) that the requirements of conciseness and clarity of **Art. 84 EPC 1973** were also applicable to claims containing disclaimers. This meant that a disclaimer was not allowable if the necessary limitation could be expressed in simpler terms in positive, originally disclosed features in accordance with **R. 29(1) first sentence EPC 1973** (**R. 43(1) EPC**). In addition, a plurality of disclaimers might lead to a claim drafting which put an unreasonable burden on the public to find out what was protected and what was not protected. A balance had to be struck between the interest of the applicant in obtaining adequate protection and the interest of the public in determining the scope of protection with reasonable effort.

In the interest of transparency of the patent, it should be clear from the specification that there was an undisclosed disclaimer and why it had been introduced. The excluded prior art should be indicated in the description in accordance with **R. 27(1)(b) EPC 1973** (**R. 42(1)(b) EPC**) and the relation between the prior art and the disclaimer should be shown.

The following rulings on the clarity of claims including a disclaimer were handed down after the decisions in **G 1/03** and **G 2/03**:

In T. 161/02 the board pointed out that the disclaimer combined features which arose from two different documents of prior art, the combination of these features resulting in a disclaimer that corresponded to neither the disclosure of the first nor that of the second document, and which did not make any technical sense. The board held that such a disclaimer rendered the claim unclear within the meaning of Art. 84 EPC 1973, as it did not allow the public to find out what was protected and what was not protected.

To justify the exclusion expressed by the formulation "non-therapeutic use" at the beginning of the disputed claim, the appellant in T. 67/02 had cited G. 1/03 and G. 2/03 (OJ 2004, 413 and 448), which had ruled that disclaimers were admissible for subject-matter not patentable under Art. 52 to 57 EPC 1973. However, the board found that in the present case it was not possible to identify a clear distinction between cosmetic use and therapeutic treatment. The board therefore took the view that the exclusion rendered the claimed subject-matter unclear.

In the claim at issue in T. 201/99 the appellants (patent proprietors) replaced the range of treatment times "1-10 minutes" by "1-6 minutes". They argued that the range of 1 to 6 minutes should be regarded as disclaiming a sub-range of more than 6 to 10, so as to remove the area of overlap between the claimed subject-matter and the prior art. The board, however, emphasised that Enlarged Board of Appeal decisions G. 1/03 and G. 2/03 (point 3 of the Reasons) explicitly ruled out the possibility of **hiding a disclaimer** by using an undisclosed positive feature defining the difference between the original claim and the anticipation, since this would affect the transparency of the patent (Art. 84 EPC 1973).

In T. 286/06 the board held that it derived from the purpose of Art. 84 EPC 1973 to ensure legal certainty, that the wording of a claim could not be interpreted by taking into consideration the teaching of further publications not referred to explicitly in the original documents of the application as being relevant for the interpretation of terms used in the description or in the claims. This applied also in the case of a disclaimer, as the only justification for its introduction in a claim was to exclude a novelty-destroying disclosure and it did not represent an opportunity for the applicant or patent proprietor to reshape its claims arbitrarily (see G. 1/03, OJ 2004, 413). The board evaluated the clarity of claim 1, considering what the skilled person would have understood in reading the claim only, taking into consideration common general knowledge. The board concluded that the wording of claim 1 was unclear.

In T. 1695/07, claims 1 to 8 of the main request were found by the board to be directed to a method for treatment of the human body by surgery which is excepted from patentability under Art. 53(c) EPC. Claim 1 of auxiliary request 2 included the feature "wherein the process is not a method for treatment of the human or animal body by surgery". Concerning the admissibility of a disclaimer excluding subject-matter not eligible for patent protection, the board in this case first stressed with reference to G. 1/03 (OJ 2004, 413) that the requirements of Art. 84 EPC are also applicable to claims containing disclaimers. A clear delimitation and distinction between excepted surgical applications and possibly allowable non-surgical applications of the claimed process requires that the two methods be distinct, i.e. **separable**, which means that they must be of a different nature and may be carried out in different ways. In the board's view, it could not be seen how the claimed

process would work without the surgical steps involved. The board concluded that the requirement of clarity was not met in the case at issue.

In T.1487/09 the board considered that all the requirements of the EPC had to be considered when examining a disclaimer, in particular those of Art. 84 EPC. The board observed that the uses excluded (namely, uses that "comprise or encompass an invasive step representing a substantial physical intervention on the body of a human or an animal which requires professional medical expertise to be carried out and which entail a substantial health risk even when carried out with the required professional care and expertise") were not explicitly defined, but rather must be derived from a condition which was to be fulfilled. Whether this condition was fulfilled or not would have to be established by the reader of the claim. Leaving room for such an assessment by the reader inevitably introduced uncertainty as to the matter for which protection was sought. Hence a lack of clarity arose, which was in breach of Art. 84 EPC. Further, the fact that the wording chosen for the disclaimer was the same as the one used in decision G.1/07 for describing a surgical method did not mean that the claim fulfilled the clarity requirements of Art. 84 EPC. This had to be handled on a case-by-case basis. A similar situation may occur when a disclaimer aiming at establishing novelty over subject-matter of a conflicting application under Art. 54(3) EPC was to be introduced.

In T.447/10, the board stated that according to the established case law of the boards of appeal, the characterisation of a product in a claim by reference to a **trade mark** lacked clarity because the product's composition could change over the term of the patent (see T.762/90, T.270/11, T.2030/13). In the case at issue, the disclaimer excluding a composition sold under a trade mark was of an uncertain scope, such that the subject-matter of claim 1 in the requests in question lacked clarity.

In T.2130/11 the board held that the difficulty in formulating an allowable disclaimer could not justify an exception to the application of Art. 84 EPC which was not foreseen in the EPC. The requirements of Art. 84 EPC must therefore apply for a disclaimer as for any other feature of a patent claim. However, the condition that the disclaimer should not remove more than is necessary to restore novelty (G.1/03) should be applied while taking into consideration its purpose, namely that the "necessity for a disclaimer is not an opportunity for the applicant to reshape his claims arbitrarily" (G.1/03). In this respect situations could be foreseen, in which, while fulfilment of the condition taken in a strictly literal way would not be possible, a definition of the disclaimed subject-matter, which satisfied the requirements of Art. 84 EPC and fulfilled the purpose of the condition (i.e. to avoid an arbitrary reshaping of the claims), might be achievable. In other words, a disclaimer removing more than was strictly necessary to restore novelty would not contradict the spirit of G.1/03, if it were required to satisfy Art. 84 EPC and it did not lead to an arbitrary reshaping of the claims. In T.1399/13 the board concurred with the approach taken in T.2130/11.

f) Undisclosed disclaimer must not be related to the teaching of the invention

According to G.1/03 (OJ 2004, 413), a disclaimer which makes a technical contribution, in particular which is or becomes relevant for the assessment of inventive step or sufficiency

of disclosure, adds subject-matter contrary to Art. 123(2) EPC (point 2.3 of the Order; point 2.6 of the Reasons). In G 1/16 the Enlarged Board endorsed the concept that the undisclosed disclaimer may not be related to the teaching of the invention and provided the following clarifications: Introducing any disclaimer into a claim necessarily changes the technical information. The question to be asked in this context is not whether an undisclosed disclaimer quantitatively reduces the original technical teaching – this is inevitably the case – but rather whether it **qualitatively changes** it in the sense that the applicant's or patent proprietor's **position with regard to other requirements for patentability** is improved. If that is the case, then the original technical teaching has been changed by the introduction of the disclaimer in an unallowable way.

In T 788/05 the undisclosed disclaimer was introduced by the appellant during the examination procedure with the purpose of establishing the novelty of the claimed subject-matter with respect to D1, which was then considered as a prior art document relevant under Art. 54(3) EPC 1973. In the case at issue, the relevant prior art was represented by documents D1 and D5. To be allowable the disclaimer had to fulfil the conditions in relation to both documents. As far as D1 was concerned, the disclaimer appeared to be appropriate. D5 represented the state of the art under Art. 54(2) EPC 1973. As D5 was not state of the art under Art. 54(3) and (4) EPC 1973 and was not an accidental disclosure, the disclaimer would only be allowable if it did not add subject-matter within the meaning of Art. 123(2) EPC 1973, i.e. if the disclaimer did not become relevant for the assessment of inventive step. Going into details, the board concluded that the subject-matter of claim 1 of the main and the first auxiliary requests was not acceptable under Art. 123(2) EPC 1973 (see also T 761/08).

In T 660/14 claim 1 of auxiliary request 4 contained two additional features according to which the operating and control members of the claimed bicycle control device were pivotable about non-common offset axes and were not pivotable commonly about either of the offset axes. The board, applying the criterion of G 1/03 as interpreted by G 1/16, considered that the disclaimers provided a technical contribution to the subject-matter disclosed. Claims 7 and 8 as filed addressed the operating member and the control member being arranged to be pivotable about parallel and/or offset axes. As indicated in the description, this may be seen as providing ergonomic advantages. The board concluded from this that the disclaimers introduced a technical difference to the amended claim when compared to the content of the original application. The pivotable arrangement of the operating and control members about the axes was of a technical nature, not least through the disclosure of the ergonomic benefits; the board concluded the disclaiming of this arrangement would have to be as well. The board held that this finding was furthermore confirmed by considering whether merely a quantitative change to the original technical teaching had occurred or indeed whether a **qualitative change** had resulted from the introduction of the undisclosed disclaimers (G 1/16). By disclaiming both common offset axes and common pivoting about either of the offset axes, the ergonomic considerations identified in the application as filed had been modified, resulting in a qualitative change to the originally disclosed technical teaching in the sense that the proprietor's position with regard to inventive step would be changed. See also T 2000/14, in which the board also found that the disclaimer led to a qualitative change to the originally disclosed technical teaching.

g) Negative features

In T 2502/13 the applicant sought to apply G 1/03 to a positive feature in order to restore novelty over a document under Art. 54(3) EPC. The board held, however, that G 1/03 did not apply in this situation.

1.7.4 Decisions applying the criteria established by the Enlarged Board in G 1/10 – remaining subject-matter test

The board in T 1224/14 found that an amendment designed to exclude a specific value from a range described as **particularly preferred** in the application as filed did not meet the G 2/10 criteria for an allowable disclaimer.

In T 2130/11 the disclaimer in the third auxiliary request excluded a disclosed embodiment **from a generic class**. The board considered that the remaining subject-matter was still generic and could not be considered as a non-disclosed subgroup which had been singled out by means of the disclaimer, so that the remaining general teaching could not be seen as being modified by the disclaimer. Whether the invention worked for the claimed subject-matter and what problem was credibly solved by it were questions which were not relevant for assessing whether this subject-matter extended beyond the content of the application as filed. See however also T 1441/13 and T 1808/13 according to which it had to be established whether the subject-matter of the invention remaining in the claim was available at the filing date.

1.7.5 Applicability of the decisions of the Enlarged Board to cases already pending

The board in T 500/00 and T 740/98 ruled that the principle of good faith could not be invoked against the application of the principles concerning the allowability of disclaimers laid down in G 1/03 to pending cases (see also T 1045/09 and chapter III.A.5.1. "Case law deviating from or overruling the practice").

1.8. Generalisations

1.8.1 Replacing specific feature with more general term – no inclusion of undisclosed equivalents

In T 416/86 (OJ 1989, 309) it was held that the fact that a technical means was known did not take away the novelty of its equivalents even if the equivalents were themselves well known. It followed that the equivalents of a disclosed technical means had to be considered new and therefore not disclosed if they were not mentioned in the original documents. In accordance with these principles, the board decided that the replacement of a specific feature disclosed in the invention by a broad general statement was to be considered as an inadmissible amendment under Art. 123(2) EPC 1973 when this general statement implicitly introduced for the first time specific features other than that originally disclosed. Therefore, the substitution in the claim of a structurally defined element by its **known** function (or **disclosed** function) was considered contrary to Art. 123(2) EPC 1973. See also T 694/07 and T 2537/10.

In T. 265/88 the board refused to allow originally undisclosed equivalents to be added by using a wider technical term in place of the single technical means originally disclosed. Similarly, in T. 284/94 (OJ 1999, 464) the board stated that an amendment which replaced a disclosed specific feature either by its function or by a more general term and thus incorporated undisclosed equivalents into the content of the application as filed, was not allowable under Art. 123(2) EPC 1973.

In T. 157/90 and T. 397/89 it was stressed that it was insufficient for the generalisation of a feature to have only formal support in the application as filed. If, for example, the application as filed only described specific embodiments, and the feature's general applicability was not evident to the skilled person, then generalisation could not be allowed.

In T. 685/90 the board stated that specific equivalents of explicitly disclosed features did not automatically belong to the content of a European patent application as filed, when this content was used as state of the art according to Art. 54(3) and (4) EPC 1973 against a more recent application. It therefore concluded that such equivalents could not belong to the content of a European patent application either, when this content was assessed to determine whether an amendment was admissible under Art. 123(2) EPC 1973. On the prohibition of including equivalents, see also T. 673/89.

In T. 40/97 the board considered that in a case where a number of generally similar embodiments were discussed in equivalent terms, the person skilled in the art would, in normal circumstances and when nothing pointed to the contrary, notionally associate the characteristics of an element of one embodiment described in some detail with the comparable element of another embodiment described in lesser detail.

In T. 653/03 the original term "diesel engine" in claim 1 was replaced by the term "combustion engine". The board decided that the treatment of exhaust gas in the original application was always related to a diesel engine, and it could not be inferred by the skilled person that the subject-matter of the granted patent extended to a method which was suitable for any type of combustion engine. The generalisation was not admissible.

In T. 868/07 the board allowed the replacement of an undisclosed feature by a more general feature disclosed in both parent and divisional applications. The board found that the general feature had been disclosed in the same context in the description and in the figures of the parent application as filed; Art. 76(1) EPC had therefore been complied with. Since the more general feature was disclosed in the same context in the divisional application as filed, the board saw also no reason for an objection under Art. 123(2) EPC.

In T. 714/08, with regard to the second auxiliary request, it was not disputed that the application as filed did not disclose in general terms the association of the three particular compounds. The appellant nonetheless asserted that amended claim 1 was supported in example 6 in the application as filed by the disclosure of a particular composition incorporating these three compounds. The board considered that, while example 6 in the application as filed certainly described a composition incorporating the three particular compounds defined in amended claim 1, it was still necessary to establish whether a specific example of that kind could constitute an adequate basis for the generalisation

adopted in amended claim 1, which provided in particular that the three compounds could be present in any quantities and possibly in association with other couplers and oxidation bases. The board concluded that, in the light merely of the information made available to the skilled person by the disclosure in this example, the amendment introduced technical information which the skilled person would not have been able to derive, directly and unequivocally, just from the disclosure in example 6 in the application as filed. This was also in line with the conditions set out in T 962/98. The board concluded that Art. 123(2) EPC had been contravened.

1.8.2 Generalisation and claim category

In T 784/89 (OJ 1992, 438) the patent application as filed explicitly disclosed a computer-controlled method for producing a particular effect. By reference to another patent application an apparatus was implicitly disclosed comprising a programmable component which, when suitably programmed, was used for the claimed method. The board considered that only this specific combination had been disclosed. To claim an apparatus for carrying out that method was considered an inadmissible extension of the application because the claim covered apparatus which could also be used in other methods and to achieve other effects. The only allowable claim was for an apparatus for carrying out a method comprising a programmable component which could be suitably programmed to carry out the method.

1.8.3 No generalisation of an effect obtained for particular embodiments

In T 3/03 the board decided that an amendment consisting in the generalisation of an effect obtained for particular embodiments was not admissible. In the case in point, the results obtained for particular embodiments could not be generalised since the particular circumstances of use, including the type of additive used, determined whether or not filterability was improved.

1.8.4 Amendments to preamble of claim by substituting general term for specific term

According to T 52/82 (OJ 1983, 416), an amended claim does not contain subject-matter which extends beyond the content of the application as filed if the preamble to the claim has been amended by substituting an appropriate more general term, which is apt to define a feature common to both the closest prior art described in the application as filed and the invention which is the subject of the application, for a specific term which is not apt to define that feature of the prior art (see also T 285/07).

1.9. Intermediate generalisations

According to established case law (as summarised e.g., in T 219/09 or T 1944/10), it will normally not be allowable to base an amended claim on the extraction of isolated features from a set of features originally disclosed only in combination, e.g. a specific embodiment in the description (T 1067/97, T 714/00, T 25/03, T 2095/12).

Amended subject-matter that amounts to a generalisation of a particular embodiment disclosed in the original application but is still more specific than the original definition of the invention in general terms is often called an "intermediate generalisation" (see e.g. [T 461/05](#), [T 191/04](#); see also [T 2311/10](#)) and sometimes an "intermediate restriction" (see [T 461/05](#), [T 879/09](#), [T 2537/10](#)). Other decisions understand "intermediate generalisation" to refer to an undisclosed – and thus unallowable – combination of selected features lying somewhere between an originally broad disclosure and a more limited specific disclosure ([T 1408/04](#)). An intermediate generalisation is different from a simple generalisation (as e.g. in [T 910/03](#), [T 404/03](#)), since in the former case a definition of the invention in general terms forms part of the original disclosure ([T 461/05](#)).

In [T 1238/08](#) the board observed that it would be contrary to the purpose of [Art. 123\(2\) EPC](#) to allow undisclosed intermediate generalisations only because the application as originally filed had not been drafted to contain appropriate fall-back positions.

An intermediate generalisation is justified only **in the absence of any clearly recognisable functional or structural relationship** among the features of the specific combination (see e.g. [T 1067/97](#), [T 25/03](#), [T 1561/14](#), [T 2003/14](#)) or if the extracted feature is **not inextricably linked with those features** (see e.g. [T 714/00](#), [T 2154/11](#) and [T 2287/11](#)). See also e.g. [T 2095/12](#), [T 2489/13](#) and [T 152/16](#) referring to both criteria, and the abstracts on [T 1500/07](#) and [T 500/11](#) below.

The board in [T 962/98](#) held that an intermediate generalisation was admissible only if the skilled person could recognise without any doubt from the application as filed that those characteristics were **not closely related** to the other characteristics of the working example and applied directly and unambiguously to the more general context (often cited, see e.g. [T 144/08](#), [T 313/09](#), [T 879/09](#), [T 2185/10](#), [T 2489/13](#)). In other words, in order to be acceptable, this intermediate generalisation had to be the result of unambiguous information that a skilled person would draw from a review of the example and the content of the application as filed.

In [T 1906/11](#) the board emphasised that classifying an amendment as an "intermediate generalisation" or otherwise, for example as an "omission of an originally claimed feature" or a "multiple selection from two groups of alternative features" did not permit, as such, the drawing of any conclusion about the allowability of this amendment under [Art. 123\(2\) EPC](#). According to that decision, the only relevant question would be whether a skilled person faced with the amended version of the application or patent, as compared to a skilled person having seen only the version originally disclosed, would derive from that amended version any additional technically relevant information. Only if such additional information was derivable can there be an infringement of [Art. 123\(2\) EPC](#) (cited in [T 802/13](#)). In [T 248/12](#) the board stated that in respect of the "technical relevance" of the added information, case [T 1906/11](#) could not be understood to define a new standard for judging amendments with respect to [Art. 123\(2\) EPC](#) since this would be at odds with the "gold standard" in [G 2/10](#), OJ 2012, 376. See also [T 1791/12](#) where the board considered that no divergent interpretations of the principles contained in [G 2/10](#) for judging amendments were apparent in [T 1906/11](#). The board in [T 1471/10](#) considered that the

ultimate standard for assessing compliance with the requirements of Art. 123(2) EPC in the case of an intermediate generalisation remains the "gold standard" (as set out in chapter II.E.1.3.1; see also T 2392/10, T 1791/12).

In T 2311/10 the board held that, in the case of an intermediate generalisation, the three-point or essentiality test was unhelpful or even misleading. See also T 1840/11, T 2095/12 and T 2489/13. On the three-point or essentiality test in general see in this chapter II.E.1.4.4 above.

According to the appellant in case T 99/09, the added feature was to be regarded as an invisible term without any additional technical content. The board observed that the feature had been disclosed in the application as filed only in combination with other structural or functional features. It was never disclosed in isolation. The application as filed provided no basis for a generalisation. Furthermore, the board pointed out that this feature had a generally established technical meaning in the relevant field. Finally, the board concluded that the term in question, although vague, did make a technical contribution to the claimed subject-matter and could not be regarded as "invisible" (in breach of Art. 123(2) EPC).

In T 284/94 (OJ 1999, 464) the board stated that an amendment of a claim by the introduction of a technical feature taken in isolation from the description of a specific embodiment was not allowable under Art. 123(2) EPC 1973 if it was not clear beyond any doubt for a skilled reader from the application documents as filed that the subject-matter of the claim thus amended provided a **complete solution to a technical problem** unambiguously recognizable from the application (see also T 1644/11).

In T 25/03 the board concluded that since claim 1 resulted from the extraction of isolated steps from the specific combination (here a sequence of steps) disclosed as **essential for obtaining the desired result in the embodiment** of Figure 4, and since the appellant had not referred to other parts of the application as filed that could support the proposed amendment, and no such parts had been identified by the board, claim 1 as amended in accordance with the first auxiliary request did not meet the requirements of Art. 123(2) EPC 1973.

In T 582/91, the respondent (opponent) was of the opinion that when restricting a granted claim by introducing subject-matter from the dependent claims **all the features of the dependent claims** in question should be incorporated in the new independent claim. Contrary to this opinion the board considered that one feature of a dependent claim could be readily combined with a preceding independent claim as long as the skilled person recognised that there was clearly no close functional or structural relationship between the one feature of that dependent claim and its other features, or between that one feature and the teaching of other dependent claims referred to in that dependent claim. If this was the case, no objections under Art. 123(2) EPC 1973 arose (see also T 938/95; and T 288/89 which concerns the combination of an independent claim with a dependent claim, without including the features of the higher dependent claim).

In T 1408/04 a specific selection had been made in amended claim 1 from the broad range of topsheet/backsheet structures within the scope of claim 1 as granted. The board

considered that, to avoid an intermediate generalisation (i.e. an undisclosed combination of selected features lying somewhere between an originally broad disclosure and a more limited specific disclosure), all the necessary features of the specific selection must be included in the claim. The selection in this case came from the **drawings**, which, however, also showed a particular (albeit commonly used) type of topsheet/backsheets connection. This particular connection was lacking in the claim. Thus an intermediate generalisation was present. With regard to the third auxiliary request, the board considered that the particular definition of the topsheet/backsheets sealed connection was not a generalisation of the content of the originally filed application. The skilled person would immediately realise that the specific topsheet/backsheets sealed configuration as shown in Figures 1 to 3 was generally applicable also to other aspects of the invention and was not limited only to the set of features shown in these Figures. The other elements present in these Figures were not inextricably linked to the topsheet/backsheets sealed configuration, as also confirmed by the description, which categorised these features as optional.

In T 461/05 the board found that claim 4 as amended defined subject-matter which was less general than that defined by claim 1 in the original version but more general than the particular embodiment corresponding to case 2a as disclosed in the description and the subject-matter of claim 6 as originally filed. Claim 4 thus represented a generalisation, also referred to in patent jargon as an intermediate generalisation. The expression intermediate generalisation conveyed the idea that the amended subject-matter was a generalisation of a particular embodiment, disclosed in the original application, which was at an intermediate point between that particular embodiment and the definition in general terms of the invention as originally disclosed. In the case at issue the amendment comprised the omission of certain characteristics of the combination of features of the particular embodiment. The board held that the provisions of Art. 123(2) EPC 1973 precluded such an amendment only where the amendment presented the skilled person with new information which did not follow directly and unambiguously from the application as originally filed. A restriction of a claim by adding a number of features from a particular embodiment originally disclosed did not in itself introduce such new information. By contrast, the omission of the remaining features of the embodiment would introduce new information if the **omitted features were necessary to carry out the particular embodiment** of the invention. In this case, the omission of these features would present the skilled person for the first time with the information that, contrary to what had originally been disclosed, these features were not necessary in order to carry out the particular embodiment of the invention. The board saw no reasons why these omitted features would be necessary to carry out the invention. Therefore, claim 4 as amended was in conformity with Art. 123(2) EPC.

In T 1387/05 the parent application disclosed two different branches of video signal transmission. The appellant's (applicant's) argument was based on the underlying understanding that the parent application disclosed two distinct branches as alternatives, and that the claims of the divisional application at issue concerned only the first branch. The board stated, however, that the parent application did not directly and unambiguously present alternative apparatuses corresponding to these two alternative branches. Instead it disclosed a recording/reproducing processing apparatus with the functionality that a broadcast wave might be transmitted and/or received. The board accepted the appellant's

argument that decision G 1/06 (OJ 2008, 307) did not state that subject-matter had to be separately derivable from what was disclosed in each of the preceding applications as filed. However, this did not mean that features which were disclosed in a given context might be claimed in a different context or specific features might be generalised without a proper basis in the parent application as filed. As the same principles were to be applied for both Art. 76(1) EPC and Art. 123(2) EPC 1973, it followed that it was normally not allowable under Art. 76(1) EPC 1973 to extract features from a set of features which were originally disclosed only in combination in a parent application and to claim such extracted features in a divisional application isolated from their context, namely the combination disclosed in the parent application.

In the consolidated cases T 1500/07, T 1501/07 and T 1502/07, the board applied the established case law of the boards of appeal concerning Art. 123(2) EPC to the case of Art. 76(1) EPC 1973. The board stressed that where newly claimed subject-matter was based on the extraction of features in isolation from a set of features originally disclosed in combination (e.g. in a specific embodiment in the description) the criterion that this subject-matter had to be directly and unambiguously derivable by the skilled person from the original disclosure was met, if there was no clearly recognizable functional or structural relationship between the features, i.e. when they were **not inextricably linked**. What is decisive is determining which specific combinations of features were originally taught by the parent, and whether the skilled person recognises immediately and unequivocally from the totality of the disclosure when read contextually and using his common general knowledge that, and which, certain features are **incidental to the proper functioning of these specific embodiments**, and that these can be dispensed with without consequence for the remaining features. In the case before the board, the fact that the claimed features were not given any special prominence, and that they were functionally and structurally bound to the other, remaining features indicated that these criteria were not met.

In T 273/10 the proposed amendments consisted of adding to the subject-matter of claim 1 characteristics derived from a particular embodiment but, at the same time, omitting other characteristics which had been described in close combination with those added. Referring to the boards' case law, in particular that established in T 461/05, the board concluded that, in the case before it, the omission of the characteristics from the claimed subject-matter was contrary to Art. 123(2) EPC since there was no indication in the application as filed that they served no purpose, were optional or could be replaced by other technically equivalent means.

In T 879/09 the board stated that a patent application described an invention in general terms together with one or more detailed embodiments. In order to overcome an objection of lack of novelty and/or inventive step the applicant often adds some but not all the features from the detailed embodiments to the general disclosure. This results in an object that lies between the original general disclosure and the detailed embodiments. Such an intermediate restriction or generalisation is permissible under Art. 123(2) EPC only if the skilled person would recognise without any doubt from the application as filed that characteristics taken from a detailed embodiment were not closely related to the other characteristics of that embodiment and applied directly and unambiguously to the more

general context (T 962/98). The test mentioned above was fulfilled, since the omitted features were not related to solving the problem addressed by the invention.

In T 500/11 the amendment in claim 1 at issue corresponded to the restriction of the range "between 50 to 10000 ppm of chromium" by the lower end value of 550 ppm. It was uncontested that there was a literal basis for this specific value in example 3 of the patent, however not in combination with the other features of amended claim 1. The question to be answered was whether the feature "550 ppm Cr" was **inextricably linked** to the other features defined in the relevant example of the patent. The board observed that all the features were parameters which might be varied individually and each of these variations would necessarily lead to a different result on the selectivity to TCS. If the feature "550 ppm chromium" was inextricably linked to specific other parameters of example 3, this would mean that the selectivity to TCS would only be achieved in the definite combination of "550 ppm chromium" with the specific other parameters of example 3. This, however, was manifestly not the case here. In the case at issue the aim of the invention – namely increasing the selectivity to TCS – was merely achieved by the addition of selected amounts of chromium to silicon and thus this feature was not "closely related to the other characteristics of the working example and applies directly and unambiguously to the more general context" as required in T 962/98. The current decision was also in line with T 273/10. It followed that the picking out of the value 550 ppm was plainly acceptable in the case at issue, with the consequence that the requirements of Art. 123(2) EPC were fulfilled. (For cases when a **range** is formed by taking an isolated value from an example, see also chapter II.E.1.5.2 "Forming a range with isolated value taken from example").

On the issue dealt with in this section, see also T 1004/01 (summarised above in this chapter II.E.1.5.2 "Forming a range with isolated value taken from example"), T 166/04, T 200/04, T 311/04, T 191/04, T 1164/04, T 98/05, T 876/05, T 300/06, T 1250/06, T 1001/01, T 1407/06, T 911/06, T 582/08, T 1582/08, T 1397/09, T 2085/09, T 88/10, T 2172/11, T 266/12, T 1587/12, T 2095/12, T 163/13, T 1162/13, T 802/13, T 2489/13, T 389/13.

1.10. Specific derived from generic

1.10.1 Specific term or embodiment derived from generic disclosure

It is a generally established principle in the case law of the boards of appeal that a generic term or embodiment does not disclose a specific term or embodiment unless the application teaches otherwise (T 88/12). In the case in hand in T 88/12 the generic term "a laundry machine" did not disclose the specific term "a drying machine".

In T 367/92 the board rejected an amendment because it contained a specific term which could not be considered to be clearly and unambiguously derivable from the originally disclosed generic term. In this case the issue boiled down to the question whether the generic term "polyester" could be equated with the specific term "polyethylene terephthalate". The sole document added by the appellant (patent proprietor) in support of this interpretation proved only that polyethylene terephthalate was a polyester (which was

never under discussion), but did not show that "polyester" could be interpreted as implicitly meaning "polyethylene terephthalate".

In T.187/91 the invention and its preferred embodiments had been described throughout the application as filed as having more than one light source. However, there was an indication in the description that although the preferred embodiment of the invention was shown as having three light sources, "it will be understood that more or less sources [...] may be utilized". The board held that a specific example (one light source) within a generic disclosure (more or less than three light sources) forming part of the description of the invention in an application as filed is part of the content of the application as filed if the skilled reader would **seriously contemplate** such specific example as a possible practical embodiment of the described invention, having regard to its context in the remainder of the application as filed, and subject to any understanding of the skilled reader to the contrary. In the case at issue the board held that the skilled reader of the application would seriously contemplate the use of only one light source.

For cases where the boards came to the contrary conclusion that the skilled person would not seriously contemplate the respective specific choice which was claimed, see e.g. T.725/99 and T.1038/01.

1.10.2 Component of entity derived from entity

In T.1228/01 the appellant (applicant) inferred that the reference to a deposited phage in a claim, whose correct deposit was mentioned in the application as originally filed, was an implicit disclosure of a part of a nucleotide sequence contained in the phage, although the sequence was not disclosed per se. The board made reference to T.301/87 (OJ 1990, 335), in which it had been decided that if an entity itself was disclosed to the skilled person, this did not necessarily mean that a component part was also disclosed for the purpose of priority if this could not be envisaged directly and unambiguously as such and required considerable investigation to reveal its identity. The board in T.1228/01 held that these findings were also applicable to amendments. It stated that the disclosure in the application as originally filed of the deposition of the recombinant bacteriophage Lgt11-P3 was not considered to be a basis within the requirements of Art.123(2) EPC 1973 for the disclosure of a DNA sequence designated as "the P3 coding sequence" which was allegedly contained in that bacteriophage, but which as such was not disclosed in the application as originally filed. Thus, the requirements of Art.123(2) EPC 1973 were not met.

1.10.3 Restricting a generic definition of a substituent to a specific (individual) one

In T.288/92 the board held that it was not permissible to amend a generic formula defining a class of chemical compounds by restricting an originally disclosed generic definition of a substituent to a specific (individual) one which was arbitrarily selected from chemical entities, such as in the examples, without some support for such restriction in the general part of the description (see also T.1537/14).

1.10.4 Multiple arbitrary selection

In T 1919/11 the board considered that the subject-matter of amended claim 1 of the main request (method for producing taxanes) resulted from a **multiple arbitrary selection** of three features (selection of one particular species and of a specific range of silver concentration and a restriction of "auxin-related growth regulator" to "auxin" for the enhancement agent). The board observed that the subject-matter of amended claim 1 related to *Taxus chinensis* only. In contrast, the summarising text of the parent application described the subject-matter as relating to a plurality of *Taxus* species. In addition, any particular mention of *Taxus chinensis* was followed by an endorsement that *Taxus chinensis* might be the best in many issues, but that the important subject-matter of the application equally was the teaching to use any member of the list of *Taxus* species. Some of the examples related to different *Taxus* species and some used *Taxus chinensis* as a model substance to show particular effects of the cultivation conditions. The board concluded that, on this basis, there was no direct and unambiguous disclosure that the subject-matter of the overall content of the application related to nothing else than a method using *Taxus chinensis*.

On unallowable multiple selection, see also above in this chapter II.E.1.6. "Combination of features pertaining to separate embodiments or lists".

1.11. Additions

1.11.1 Addition to the claim of a feature taken from drawings

For examples concerning the insertion of additional features to the claim taken from **drawings**, see below in this chapter II.E.1.13. "Disclosure in drawings".

1.11.2 Addition to the claim of an isolated feature taken from description

For examples concerning the insertion of an **isolated** feature to the claim taken from the **description**, see above in this chapter II.E.1.9. "Intermediate generalisations".

1.11.3 Addition to the claim of features originally presented as prior art

In T 912/08 the board held that an amendment that resulted in features originally presented as part of the prior art, being then presented as the invention could be damaging to the legal security of third parties relying on the content of the original application and added subject-matter contrary to Art. 123(2) EPC.

In T 1652/06 the board drew a distinction as to whether in the application as originally filed the feature in question was disclosed as part of the background art or as part of the invention. In the case at issue, the feature was taken from the background art and could not serve as basis for the amendment (see also T 626/11).

1.11.4 Addition to the claim of features previously described as non-essential

In T 583/93 (OJ 1996, 496) the board held that any attempt to interpret Art. 123(2) EPC 1973 such that the introduction into a claim of **features previously described as non-essential** would not be permissible, had to fail. The Convention contained no requirement that forbade the redefinition of an invention provided that Art. 123(2) and (3) EPC 1973 were complied with. Such a redefinition was often necessary in order to take into account prior art not known to the applicant at the priority date. It was therefore possible that features described as optional at the priority date later became essential in the sense that they were necessary to delimit the invention from the prior art. The introduction of such features was permissible provided that, first, the application as originally filed contained an adequate basis for such limitations and, second, the resulting combination of features was still in line with the teaching of the application as originally filed.

1.11.5 Adding prior art citations to the description

In T 2321/08 the board considered the question of whether R. 27(1)(b) EPC 1973 required that prior art known to the applicant be acknowledged in the application already at the time of filing it. The board came to the conclusion that R. 27(1)(b) EPC 1973, or equivalent R. 42(1)(b) EPC, does not put a stringent obligation on the applicant to acknowledge prior art known to him, and to cite documents known to him reflecting this prior art, already at the time of filing the application. Furthermore, no requirement of the EPC prohibits amending an application in order to meet the provisions set out in R. 27(1)(b) EPC 1973 or R. 42(1)(b) EPC (endorsed by T 1123/09 and cited in Guidelines F-II, 4.3 – November 2018 version).

In T 11/82 (OJ 1983, 479) it was pointed out that the mere addition to the description of a reference to prior art could not reasonably be interpreted as the addition of "subject-matter", contrary to Art. 123(2) EPC 1973. Whether it did so would clearly depend on the actual language used and the circumstances of the case.

In T 211/83 the board even considered it essential that details of the way a component of the invention worked, which could only be inferred from previously published advertising literature referred to in the description, be included in the description since they were of significance for the invention.

In T 450/97 (OJ 1999, 67) the board confirmed that the mere addition of a reference to prior art did not contravene Art. 123(2) EPC 1973. It added that after limitation of the claims, also at the opposition stage, a document which subsequently proved not only to be the closest state of the art, but also to be essential for understanding the invention within the meaning of R. 27(1)(b) EPC 1973 was to be introduced in the amended description. See also T 276/07.

In T 889/93 the appellant (patent applicant) explained that the closest prior art was shown in two figures of the contested application. In his reply to the board's objection of obviousness he submitted that these figures did not show the state-of-the-art device

correctly as they were misleadingly oversimplified. The board allowed originally filed drawings to be replaced by better ones since this only removed an inaccuracy in the representation of the state of the art and did not affect the disclosure of the invention per se. T.1039/93 found along similar lines. In the case at issue, certain figures of the application as filed had been erroneously labelled as prior art while in fact representing in-house technical knowledge of the appellant that had not been made available to the public. The board did not object to the deletion of the labels "prior art" from the relevant figures since such deletion neither infringed Art. 123(2) EPC 1973 nor affected the disclosure of the state of the art; on the contrary such amendment was necessary to avoid giving an inaccurate representation of the state of the art. After the amendment the description correctly indicated the prior art as required by R. 27(1)(b) EPC 1973.

1.11.6 Addition of advantages and effects to the description

In T.11/82 (OJ 1983, 479) the board stated that the addition of a discussion of the advantages of the invention with reference to the prior art did not necessarily constitute a contravention of Art. 123(2) EPC 1973. Whether Art. 123(2) EPC was infringed depended on the actual language used and on the circumstances of the individual case. See also T.725/05 where the addition of an analysis and discussion of a prior art document which went far beyond the disclosure of said document was considered contrary to Art. 123(2) EPC.

In T.37/82 (OJ 1984, 71), for example, a technical feature was clearly disclosed in the original application but its effect was not mentioned or not mentioned fully. It could however be deduced from the original application on the basis of normal expert considerations. T.434/97 stated that when introducing features not explicitly disclosed, it was necessary that such features could be unmistakably and fully derived from the original text (in this case the parent application); this corresponded to the opinion in T.37/82. In the case at issue the added effect could not be derived from the original text.

1.11.7 Addition/change of claim category

In T.243/89 the applicant had originally claimed a catheter only for medical use; during examination proceedings he filed a further claim for its manufacture. The board of appeal saw no reason to refuse the filing of an additional method claim for forming the apparatus, in view of the similar wording and thus of the close interrelationship between both independent claims. Since the result of the activity was in itself patentable, such methods were also patentable unless the disclosure was insufficient.

In T.49/11 the board found that it is well-established that subject-matter is not added by a change of claim category per se. The relevant question to be answered was whether there was a basis for the new claim category. In the case in issue the originally filed product claims were changed to claims to a method of treatment. The board, after analysing the disclosure of the application as filed, concluded that this change of category complied with Art. 123(2) EPC.

1.11.8 Insertion of an ambiguous feature in the claim

In T 792/94 the board ruled that since the teaching of claim 1 as amended was ambiguous (Art. 84 EPC 1973), allowing scope for an interpretation which extended beyond the overall teaching of the initial application, the amendment contravened Art. 123(2) EPC 1973.

In T 1067/02 the board came to the conclusion that the **unclear** nature of the amendment introduced upon grant in claim 1 as filed, i.e. the introduction of the term "complete", allowed two different interpretations and, although they were both technically sensible, neither of them was directly and unambiguously derivable from the general disclosure of the application as filed. Consequently, claim 1 of the main request extended beyond the overall teaching of the application as originally filed.

In T 2298/09 the board held that, although the alternatives g2 and g3 remained **without a clearly derivable meaning**, it was not disputed that their introduction into claim 1 added information to the teaching of this claim. The group of features (g) encompassing these alternatives could not be ignored when examining these amendments under Art. 123(2) EPC.

See also the related topic "Claim interpretation when assessing compliance with Art. 123(2) EPC" in chapter II.E.1.3.9 above.

1.11.9 Characteristic described for intermediate product added to the claimed end product

In T 314/07 the question arose whether the amendment of the claim directed to the absorbent material was directly and unambiguously derivable from a passage of the application as filed not describing the final absorbent material as such but the preparation of the intermediate film used therefore. The particular characteristics of the intermediate film described in the application as filed could be automatically transferred to the final absorbent material only if these characteristics would remain unchanged throughout the process of preparing the absorbent material (see also T 320/10). The board concluded that Art. 123(2) EPC was infringed.

1.12. Errors in the disclosure

1.12.1 Calculation errors

In T 13/83 (OJ 1984, 428), a case decided prior to G 3/89 (OJ 1993, 117) and G 11/91 (OJ 1993, 125) (see in this chapter II.E.4. "Correction of errors in the description, claims and drawings – Rule 139 EPC" below), the board held that R. 88 EPC 1973 (R. 139 EPC) did not apply to a non-obvious correction of an error in the description or claims which resulted from an erroneous technical calculation. A correction of such an error was allowable under Art. 123(2) EPC 1973 if the amendment would be regarded by the skilled reader as clearly implied by the disclosure of the application as filed. If more than one arithmetical possibility of correction could be envisaged, the correction chosen had to be

the one which the application as a whole clearly implied (see also [T.784/96](#), which cites [T.13/83](#)).

1.12.2 Incorrect structural formula

In [T.552/91](#) (OJ 1995, 100) the question arose as to whether and in what form protection could be obtained for groups of chemical substances and individual compounds whose originally disclosed structural formula proved incorrect. The applicant's main request was aimed at securing such protection by a further substance claim for the group of compounds with the structural formula subsequently found to be correct. This request was refused on the grounds that it would violate [Art.123\(2\)EPC.1973](#). The board held that the subsequently amended general formula gave the skilled person for the first time crucial information about the true chemical structure of the group of substances. This led to conclusions regarding properties that could be put to use. The information added to the application through the amendment of the general formula and relating to the true composition of the group of substances could not have been obtained from the application as originally filed (for decisions referring to [T.552/91](#), see [T.1074/97](#) and [T.2003/07](#); for a further example of the correction of an error in a formula, see [T.1728/07](#)).

1.12.3 Amendment based on erroneous figure in the disclosure

In [T.740/91](#) the board allowed a change in the upper limit of a range from 5 % to 0.6 %. The value of 0.6 % was explicitly disclosed in example IV. However, the patentee conceded that this figure had been inserted in error in place of the true figure of 0.49 %. The board concluded that the fact that the figure was wrong did not alter the fact that it was actually and credibly disclosed. It could thus be relied on as the basis for the new upper limit. This interpretation of [Art.123\(2\)EPC.1973](#) was consistent with its underlying intention, which was to protect the public from being faced at a later stage with claims which were wider in their scope than what had been disclosed in the application as filed, and published for the information of the public, including the applicant's competitors. In this case, any such competitor who had read the application as first published had formed the view that the originally claimed range of 0.1 to 5 % was too wide in the light of the prior art, and had thought that the broad claim could not validly be sustained. He would have seen at once that the highest figure for the cured epoxy resin given in any example was 0.6 %, as clearly disclosed in example IV, and therefore could not have been taken by surprise if the upper limit of 5 % were later to be reduced to 0.6 %. The fact that the figure was wrong would be unknown to competitors, and therefore could not influence their judgment.

1.12.4 Incorrect information in earlier application as filed but correct information directly and unambiguously derivable

In [T.1088/06](#) an appeal was filed against the decision of the Examining Division refusing the European patent application, which had been filed as a divisional application on the ground that the application extended beyond the content of the earlier application as filed. Both the expression " 10^{-4} to 10^{-9} " and the expression " 10^4 to 10^9 " had occurred several times in the earlier application; the divisional application referred to a range between about

10^4 to 10^9 Ohm/cm². The Examining Division held that the correct range could not be directly and unambiguously derived from the parent application as originally disclosed. The board could not agree. If information in the earlier application was **objectively recognisable** by the person skilled in the art as information that was **incorrect**, and if the person skilled in the art would derive the correct information directly and unambiguously, using common general knowledge, and seen objectively and relative to the date of filing, from the whole of the documents of the earlier application as filed, then the correct information belonged to the content of the earlier application and might be used to decide whether a divisional application extends beyond the content of the earlier application as filed (Art. 76(1) EPC). In the case before it, the board concluded that the range mentioned in the divisional application did not introduce subject-matter extending beyond the earlier application as filed.

1.13. Disclosure in drawings

When examining whether there is support for a feature in a drawing the exact same standards must be applied as for the description: the crucial point is what the skilled person would derive directly and unambiguously from the drawing using common general knowledge (T.2537/10).

The case law according to T.169/83 (OJ 1985, 193) - which has been frequently cited -, T.523/88 and T.818/93 shows that the EPC does not prohibit the amendment of claims to include **features from drawings**, provided the structure and the function of such features were clearly, unmistakably and fully derivable from the drawings by the skilled person and not at odds with the other parts of the disclosure. Nor could any element be dropped.

Indeed, in T.169/83 (OJ 1985, 193), T.465/88 and T.308/90 it was pointed out that where drawings existed they were to be regarded as an integral part of the documents disclosing the invention. Drawings were to be **treated on an equal footing with the other parts of the application** (see also chapter II.E.1.2.1 "Description, claims and drawings"). Further, the fact that features were disclosed solely in the drawings did not preclude these features from becoming essential in the course of the proceedings (T.818/93). The features for which a skilled person could clearly derive the structure and function from the drawings could be used to define more precisely the subject-matter for which protection was sought (T.372/90).

In T.398/92 the patent claims as amended contained features that had not been mentioned *expressis verbis* in the written part of the original application but had been derived from the figures for the application as filed. The drawings in question illustrated the curves in a system of Cartesian co-ordinates with a precise, defined scale. The curves therefore could not be compared to the schematised representation of an invention given by a graph. The board recognised that the points of these curves were not purely intellectual graphic constructions but, on the contrary, corresponded to real experimental values, representing the percentages of a particular drug released in solution. Although these percentages were not mentioned *expressis verbis* in the original document, the board was of the opinion that for a skilled person they would have been clearly and unambiguously derivable from the scale given on the Y-axis, since the figures were sufficiently precise for the ordinate values

to be read exactly and thus for the same numerical features as introduced in the claims to be derived from them. The incorporation into the text of the claims of the numerical features derived from the curves therefore did not contravene Art. 123(2) EPC 1973 (as far as a **graph representing a mathematical equation** is concerned, see T 145/87). This case related to a process for regulating the print quality of printers which could only be carried out using statistical calculations. On the basis of a formula given *expressis verbis*, its representation as a graph according to the Cartesian co-ordinate system and a basic knowledge of statistics, the possible values of two parameters in the formula, though not expressly disclosed, could be deduced.

In T 191/93 amendments were based exclusively on the original drawings and introduced only some of the features disclosed in the drawings. The board held that the subject-matter of the patent had been extended compared to the application as filed because it was not derivable from the drawings that the two newly introduced features could be **isolated from the other features** shown in the drawings. The subject-matter defined in the claims thus amended was ambiguous. In this case, however, the ambiguity could be removed by also introducing into the claim a third feature, disclosed in the drawings as filed, together with the other two features. (For cases where the isolation of features from a drawing amounted to an unallowable intermediate generalisation, see T 1408/04 and T 983/12.)

In T 676/90 the applicant wished to delete the rolling-device features of a carrying aid for a pair of skis. The board found, however, that the original documents had disclosed only a carrying aid consisting of a rolling device and a carrying strap or only of a rolling device, but not an option without a rolling device. Nor was the board swayed in its view by the applicant's argument that the carrying strap was shown separately in a drawing. It held firstly that, according to the description, this drawing was an expanded view of the carrying strap shown in Figure 1 (which, moreover, showed a ski with the carrying strap in conjunction with the rolling device). Secondly, a drawing could never be interpreted in isolation from the overall content of the application but only in that general context. The content of an application was defined not only by features mentioned or shown therein but also by their relationship to each other.

In T 497/97 the board noted that, since drawings were often approximate and therefore unreliable, they could only be used in interpreting amended claims if the description did not contain a more precise indication of what was meant. Moreover, in the case at issue, the drawings showed only a preferred embodiment of the invention, which did not rule out the possibility of other embodiments covered by the claimed subject-matter. The board concluded that the contested wording, inserted in the characterising portion of claim 1, had been validly based on the description according to the application, i.e. that the wording had been inferable from its context without extending its meaning.

In T 748/91 the board, agreeing with the appellant, held that schematic drawings depicted all the essential features. The board reached the conclusion that size ratios could be inferred even from a **schematic drawing** as long as the delineation provided the relevant skilled person with discernible and reproducible technical teaching (with reference to T 451/88). In the case at issue the description provided the skilled person a sufficient teaching for an unambiguous interpretation of the drawing.

In T.1148/12 the board distinguished the case at hand from the one in T.748/91. In the case at issue in T.1148/12, the schematic nature of the figures did not allow the skilled person to clearly and unmistakably derive the feature in question (parallel arrangement of electrodes), nor did the description of the original application allow him to clearly and unmistakably derive anything related to the function of the purported parallel arrangement.

In T.614/12 the board found that the drawing did not show any measurements or scale or give any other indication that it was an exact engineering drawing reproducing the construction elements to scale. It was thus no more than a schematic illustration of the kind commonly found in patent documentation. The imprecision of such an illustration made it impossible to measure angle sizes.

In T.170/87 (OJ 1989, 441) the board held that a figure which served only to give a schematic explanation of the principle of the subject-matter of the patent and not to represent it in every detail did not allow the sure conclusion to be drawn that the disclosed teaching purposively excluded a feature not represented. Such a **"negative" feature** (in this case, "with no internal fittings") could not subsequently be incorporated into the claim (see also T.410/91, T.1120/05 and T.474/15). Regarding the absence of a feature in a figure which served only to give a schematic explanation of the principle of the invention, see also T.264/99, in which the board found the circumstances to be different from those in T.170/87.

Likewise, in T.906/97 the board held that the parent application as filed failed to disclose unambiguously the position of a door. The only indication of this position could be found in some figures, and in the board's view there was no suggestion whatsoever in the description itself that this detail of the schematic representation was actually meant to correspond to a technical feature of the apparatus shown in the figures, rather than being merely an expression of the draughtsman's artistic freedom.

In T.1120/05 the invention concerned an "arrangement for and a method of managing a herd of freely walking animals" and the amendment introduced a **negative feature** namely "but not to the milking station". This negative feature was not expressly disclosed in the description and in the claims of the patent application as filed. Features could be taken from the drawings if their structure and function were clearly, unmistakably and fully derivable from the drawings. It was not possible to derive a negative or missing feature on its own, i.e. without the context of the other, existing features of the claim. Moreover, **arbitrarily** choosing one of many possible negative features was not permitted (see also T.777/07), because the skilled person not only had to realise the possible negative features, but because they were derived from the drawings, he also had to establish which one of the features was essential to the invention and which ones were not. The board found that in the absence of a teaching from the description, the skilled person would be unable to establish the essential nature of a single negative feature, seen against a background of a multitude of potentially essential features, even if this selected single negative feature in the drawings could be recognised by the skilled person in the drawings.

In T.1544/08 the board observed that, if **drawings** were originally filed in **colour** at the date of filing of an application, then the technical content of these original colour drawings

should be determined when establishing the content of the application as filed, for the purpose of examining compliance of amendments with Art. 123(2) EPC.

1.14. Amending the description

1.14.1 Amendment to provide support for unsupported claim

T 133/85 (OJ 1988, 441) concerned a case where a feature was described as an essential feature of the invention but was not contained in the claim. The claim was therefore not supported by the description (Art. 84 EPC 1973). An amendment to the description to provide support for the claim was, however, not allowable under Art. 123(2) EPC 1973, because the amended description would contain subject-matter which extended beyond the content of the application as filed – namely information that such feature was not an essential feature of the invention.

1.14.2 Impact on the claimed subject-matter

The board in T 835/11 held (in relation to a divisional application) that an amendment to the description could result in an inadmissible extension only if it changed the subject-matter. That might be the case, for instance, if the description initially defined a feature in the claims more narrowly than its usual meaning; deleting the definition from the description could then result in an inadmissible extension of the patent's subject-matter. Removing or adding examples might also affect how the claims were understood and so also change the patent's subject-matter (see e.g. T 1239/03, in chapter II.E.1.14.3 below). The boards had also repeatedly held that reformulating the problem to be solved could inadmissibly extend the patent's subject-matter (see e.g. T 13/84, OJ 1986, 253, in chapter II.E.1.14.6). By contrast amendments to the description which had no effect on the claimed subject-matter were not open to objection. In the case in hand, Art. 100(c) EPC had not been infringed. See also chapter II.E.1.14.4 "Shift in the interpretation of a claim by amendment of the description"; however see also chapter II.E.1.14.5 "Shift in the information provided by the examples after amendment of claims".

1.14.3 Adding prior art citations to the description

For cases concerning the addition of prior art citations to the description, see above in this chapter II.E.1.11.5.

1.14.4 Shift in the interpretation of a claim by amendment of the description

In T 500/01 the board stated that a claim, the wording of which was essentially identical to a claim as originally filed, could nevertheless contravene the requirements of Art. 123(2) EPC 1973 if it contained a **feature whose definition was amended in the description** in a non-allowable way. The specific definition of a feature which according to the description was an overriding requirement of the claimed invention was applied by a skilled reader to interpret that feature whenever it was mentioned in the patent. Since in this case the definition had no basis in the application as filed, claim 1 did not meet the requirements of Art. 123(2) EPC 1973.

In **T. 1239/03** it was not in dispute between the parties that no part of the patent contained a definition of the ethylene content of the elastomeric copolymer in terms of weight percent. Prior to the amendment, preference was given to the interpretation "mol percent", which, with the deletion of example 3, had shifted towards "weight percent". In such a case, where it was certain that a shift in the interpretation of the claims had occurred, but uncertain if this would lead to an addition of subject-matter, the board took the view that it should be incumbent upon the patent proprietor or applicant as the author of such amendment(s) to demonstrate that the requirements of Art. 123(2) EPC 1973 were complied with in making them. In the case at issue, the patent proprietor was unable to show that the percentage value could have been consistently interpreted as "weight percent" before and after the amendments.

In **T. 1227/10** the claim as granted was similar to the claim as originally filed. However, other than in the patent as granted, the original application also contained a figure 1 labelled as prior art and a corresponding passage of the description. The board found that the original application did not include the possibility of using a filter as gas solid separator for further treating the underflow of the TSS before entering the wet scrubber, whilst the patent as granted encompassed such a possibility. Hence, the deletion of original figure 1 and of the related passage of the description had modified the application in such a way that the granted claim 1 included subject-matter which was excluded from the originally filed invention.

1.14.5 Shift in the information provided by the examples after amendment of claims

T. 97/05 concerned an amendment of a claim resulting in a shift in the information provided by examples. During the opposition proceedings, claim 1 was modified by replacing the term "chemically" with "covalently" in order to specify the nature of the bond between the anionic groups and the core. The information provided by the description was that the bonding between the core and the anionic group was "chemical" and that one type or species of "chemical" bonding was "covalent". The term "chemically bonded" as employed in the general description of the application as filed encompassed, but did not specifically disclose, compounds in which the anionic moieties were "covalently" bonded to the core. In the board's view a consequence of the amendment of the claims by replacement of the generic term "chemically bonded" by the specific term "covalently bonded" was that the examples of the patent acquired by association information, i.e. that the anionic groups were covalently bonded to the core, which was not – even implicitly – contained by the same examples in the application as filed. Thus there was a shift in the information provided by the examples in the patent as amended according to the main request compared to that provided by the same examples in the application as filed, even though the examples themselves had not been modified (by analogy with **T. 1239/03**). Therefore the main request did not meet the requirements of Art. 123(2) EPC 1973.

1.14.6 Reformulation of the technical problem

Expanding on **T. 13/84** (OJ 1986, 253), it was stated in **T. 547/90** and **T. 530/90** that reformulating the technical problem was not in breach of Art. 123(2) EPC 1973 provided the problem as clarified and the solution proposed could have been deduced from the

application as a whole in the form originally filed (see T.871/08 of 8 December 2011, T.2076/09).

On the reformulation of the technical problem, see also chapters I.D.4.4. – 4.6.

1.14.7 Replacement of complete description and drawings

In G.2/95 (OJ 1996, 555) the Enlarged Board observed that a correction affecting the content of the application could only be effected within the limits of Art. 123(2) EPC (as defined in G.3/89, OJ 1993, 117). The complete documents forming a European patent application, that is the description, claims and drawings, could not be replaced by way of a correction under R. 88 EPC by other documents which the applicants had intended to file with their request for grant.

In J.16/13 the board held that the ratio decidendi of G.2/95 (and also of J.5/06) was also applicable to all cases where at least a complete description was sought to be exchanged.

1.14.8 Deletion from the description of expressions making features optional

In T.2466/13 the appellant (opponent) had raised an objection under Art. 123(2) EPC, contending that the way the patent description had been adapted, in particular the deletion of expressions showing that features included in the main claim were optional, was liable to give the proprietor an undue advantage in any infringement action, especially one alleging infringement by equivalent means. The board disagreed, observing that, since the original application had been published, the defendant in any such action would still be able to cite the amendments made during the EPO proceedings by producing it alongside the patent as granted and/or amended.

1.15. "Comprises", "consists of", "consists essentially of", "contains"

In T.759/10 it had to be examined whether there was a clear and unambiguous implicit disclosure in the application as filed providing a basis for the amendment from "comprises" to "consists essentially of". The appellant argued that the term "**comprising**" encompassed three alternatives, namely (i) "comprising", (ii) "consisting of" and (iii) "consisting essentially of", and that each of these alternatives would immediately come to the skilled person's mind when reading the term "comprising". The term "comprises" was therefore in itself already a sufficient basis for the term "consists essentially of". The board could not accept this argument as each term had a different technical meaning, namely (i) that any further component can be present ("comprises"), (ii) no further component can be present ("consists of") and (iii) specific further components can be present, namely those not materially affecting the essential characteristics of the texturizing agent ("consists essentially of"). Therefore the skilled person was not at liberty to choose whichever of the three terms he wished when reading the term "comprises". The board further refused the request for referral of questions to the Enlarged Board of Appeal. Although the board agreed with the appellant that the two boards in decisions T.472/88 and T.975/94 appeared to have considered the term "comprises" in itself to be a sufficient basis for the term "consists essentially of", the jurisprudence of the boards had further developed since

these two decisions, in particular by way of the two later decisions of the Enlarged Board of Appeal in G 2/98 (OJ 2001, 413) and G 1/03 (OJ 2004, 413). In line with these decisions of the Enlarged Board of Appeal, more recent decisions of the boards of appeal, e.g. T 868/04, T 725/08 and T 903/09, had applied the criterion of clear and unambiguous disclosure to decide on the allowability of the amendment of the term "comprises" to "consists essentially of". These decisions had considered that this criterion is not automatically fulfilled by the term "comprising" alone. In the case at issue in T 759/10, the replacement of the word "comprising" by "consisting essentially of" was found to contravene Art. 123(2) EPC, but the replacement of the word "comprising" by "consisting of" was allowed.

According to T 1271/13 it is today settled that the term "comprising" is not generally accepted as direct and unambiguous basis for an amendment to "consisting essentially of".

In T 56/08 the board rejected the respondent's argument that the verb "**to contain**" had a more restrictive meaning than the verb "to comprise"; the board pointed out that the general meaning of the verb "to contain" was "to have in it", "to hold", "to include", "to encompass" or "to comprise".

In T 1170/07 "consisting essentially of" was substituted for "comprising". Before evaluating whether the original disclosure in its entirety specifically disclosed the claimed unit dosage form consisting essentially of tetrahydrolipstatin, it had to be established what the term "consisting essentially of", which could not be found in the original application, meant in the context. The board recalled on this occasion that claims should be read in a technically reasonable way. In the case at issue, the expression "consisting essentially of" excluded the presence of further active agents useful in the treatment of the specific disease concerned but allowed the presence of additional compounds forming the carrier for the active agent. The board concluded in this case that the substitution of "consisting essentially of" for "comprising" was allowable under Art. 123(2) EPC.

In T 108/14 the board distinguished the case at issue from the one in T 1170/07 because it was not directly and unambiguously derivable from the application as filed, which "active agents" were useful. Furthermore, the board referred to a line of jurisprudence (e.g. T 1095/09, T 759/91, T 522/91, T 472/88) according to which the expression "consisting essentially of" was found to be clear and to allow the presence of other components in addition to the components mandatory in the claimed composition, provided that the essential characteristics of the claimed composition were not materially affected by their presence. However, in the case at issue, the application as filed was silent as regards the components which, in addition to those defined in claim 1 at issue, could be allowed in the claimed refractory without affecting its essential characteristics.

In T 299/12 the board held that introducing a restriction in claim 1 to components (a) to (e) by the expression "consists essentially of", which was not explicitly mentioned in the application as filed, added subject-matter. The board noted that the respondent's (proprietor's) arguments relied on a preliminary selection of embodiments which would leave out of the scope typical compositions lacking any of the ingredients now considered

as essential by claim 1. Moreover, by defining cross-linking agents as optional, claim 1 encompassed subject-matter which extended beyond the content of both the application and the parent application as originally filed. All of the selected examples on which claim 1 would be based appeared to contain triethanolamine (i.e. a cross-linking agent), thereby suggesting that, for the particular combination of components defined in claim 1, triethanolamine would be an essential feature.

In T.107/14 the appellant (opponent) argued that claim 1 extended beyond the content of the application as filed because it was directed to an alloy "consisting of" the given elements, whereas claim 1 as originally filed related to an alloy "comprising" the given elements. The board held that, since the originally filed claim 1 already disclosed that the rest of the composition consisted of Ni, not allowing for the presence of further elements, and thus was already directed to closed compositions, the composition stipulated by claim 1, "consisting of" the given elements, was already disclosed in the application as originally filed.

In T.1634/13 the claim as granted combined the subject matter of various claims as filed, with the terms "comprising" and "containing" being replaced by the terms "consisting in" or "consisting of". The board held that specific examples in the application taught that the terms "comprising"/"containing" included the term "consisting" as a particular, originally disclosed meaning. While it was true that the change in wording restricted the subject-matter with respect to the original wording, such a restriction was not objectionable under Art.123(2) EPC. In particular, there had been **no singling out** within the meaning of G 2/10.

On issues of clarity raised by the terms "comprising (substantially)", "consisting (essentially) of", "containing", see chapter II.A.6.2.

1.16. Different sets of claims for different contracting states

In T.658/03 the board stated that any change of attribution of claimed subject-matter in an application or patent having different (sets of) claims for different contracting states, to a contracting state under which that subject-matter was not previously included, amounted to an amendment within the meaning of Art.123 EPC 1973. Such an amendment was subject, in principle, to full examination as to its conformity with the requirements of the Convention.

2. Article 123(3) EPC – extension of the protection conferred

According to Art. 123(3) EPC the European patent may not be amended in such a way as to extend the protection it confers. This refers to the patent as a whole. The wording of Art. 123(3) EPC 1973 had referred only to the claims of the patent; however, already under the EPC 1973, the boards had held that amendments to the description and the drawings could also extend the protection conferred within the meaning of Art. 123(3) EPC 1973 (see T.1149/97, OJ 2000, 259).

Art. 123(2) EPC and Art. 123(3) EPC are mutually independent of each other (G 1/93, OJ 1994, 541); the same is true for Art. 76(1) EPC and Art. 123(3) EPC (T 1736/09).

2.1. Purpose of Article 123(3) EPC

Art. 123(3) EPC is directly aimed at protecting the interests of third parties by prohibiting any broadening of the claims of a granted patent, even if there should be a basis for such broadening in the application as filed (G 1/93, OJ 1994, 541). In accordance with the general intention of Art. 123(3) EPC, there should be legal certainty for the activities of third parties trusting that the protection conferred by a patent can only be restricted, but not extended (T 1149/97).

The object of Art. 123(3) EPC is to prevent any procedural situation where an act which does not infringe the patent as granted becomes an infringing act as a result of an amendment after grant (see T 1149/97, T 1898/07 referring to T 59/87, OJ 1988, 347 and T 604/01).

2.2. Totality of claims

In accordance with the established case law of the boards of appeal, the legal notion "protection conferred" in Art. 123(3) EPC refers to the **totality** of protection established by the claims as granted and not necessarily to the scope of protection within the wording of each single claim as granted (T 579/01, T 1456/06, T 1544/07, see also T 49/89, T 402/89). According to G 2/88 (OJ 1990, 93), it is the totality of the claims before amendment in comparison with the totality of the claims after the proposed amendment that has to be considered.

Under Art. 123(3) EPC, the patentee is generally allowed to redraft, amend or delete the features of some or all claims and is not bound to specific terms used in the claims as granted as long as the new wording of the claims does not extend the scope of protection conferred as a whole by the patent as granted (and does not violate the requirements under Art. 123(2) EPC). Thus, in order to assess any amendment under Art. 123(3) EPC after grant, it is necessary to decide whether or not the totality of the claims before amendment in comparison with the totality of the claims after amendment extends the protection conferred (T 579/01, T 1898/07).

2.3. Extent of protection

2.3.1 Article 123(3) EPC and Article 69 EPC

In T 325/95 the board pointed out that the assumption that the extent of protection referred to in Art. 123(3) EPC 1973 would depend not only on the actual wording of the claims, but also on their validity in view of the prior art, was not supported by the explicit statement in Art. 69 EPC 1973 that "the extent of the protection conferred by a European patent ... shall be determined by the terms of the claims". The appellant's submissions also implied that claims amended in opposition proceedings should always have a counterpart in the set of claims as granted. The board noted that this was not in line with the consistent case law

of the EPO either. Attention was drawn for instance to decision G 2/88 (OJ 1990, 93), which ruled that replacement of a granted claim to a compound or composition by a claim directed to a new use of the compound or composition was admissible under Art. 123(3) EPC 1973.

In T 81/03 the board stressed that Art. 69 EPC 1973 and its Protocol were to be applied in proceedings before the EPO whenever it was necessary to determine the protection conferred (see e.g. G 2/88, OJ 1990, 93). **Equivalence considerations** obviously often played a prominent role in national infringement proceedings, and although equivalents were not mentioned in the EPC 1973, they would be in the Protocol on Art. 69 of the revised Convention, EPC 2000. Nevertheless, if the opponents had been right in their allegations, it would never be possible to amend a claim during opposition proceedings since the addition of any new feature to some extent necessarily reduced the weight of the features in the claim as granted. This was particularly true when the subject-matter of the granted claim was not new. For that reason the argument could not be accepted. The board thus found that the general, abstract concern that the addition of a feature to a claim after grant led to an extended scope of protection because the resulting combination of features might give rise to a different evaluation of equivalents in infringement proceedings was not in itself a sufficient reason for not allowing the addition of limiting features under Art. 123(3) EPC 1973.

In T 177/08, with reference to Art. 123(3) EPC, the board referred to Art. 69(1), second sentence, EPC, which provides that the description and the drawings are to be used to interpret the claims. The board said that it had therefore to be decided whether said interpretation of the claims by the content of the description was limited to cases where the claims were in need of interpretation, e.g. because of functional or unclear features, or whether it also applied to the case at issue, where a **well-known and generally accepted meaning of a term** was overthrown and replaced by a new definition given in the description. The board was of the opinion that the second sentence of Art. 69 EPC did not apply to cases where an unambiguous and generally accepted definition of a term figuring in the claims was to be superseded by a different definition found in the description. If it was intended that a term which was in no need of any interpretation be given a new meaning, then the definition for this new meaning had to be put into the claims. Third parties could not be expected to check every single term of the claims for a potentially different meaning that might be hidden somewhere in the description. As a consequence, the board concluded that the subject-matter of the main request extended the protection conferred.

In T 547/08 the board stated that the appellant's (opponent's) arguments relating to the rights of the patent proprietor to sue for indirect or contributory infringement were not relevant to the issue of extension of the scope of protection under Art. 123(3) EPC. In G 2/88 (OJ 1990, 93) it was clearly ruled that it was **not necessary to consider the national laws of the contracting states** in relation to infringement and that this issue was not relevant when deciding upon admissibility of an amendment under Art. 123(3) EPC. With respect to the question of an extension of the scope of protection under Art. 123(3) EPC, it was, rather, appropriate to take into account the fact that the protection conferred by a patent was determined by the terms of the claims, and in particular by the

categories of the claims and their technical features, in accordance with Art. 69(1) EPC and its protocol (G 2/88, OJ 1990, 93).

In T 1172/08 the board considered that the interpretation of the protection conferred by a patent according to Art. 69 EPC was in general not one of the duties of the boards of appeal (cf. T 175/84). For the purpose of establishing whether the amendments of the main request fell foul of the provisions of Art. 123(3) EPC, it was however necessary to do so. The board stated that claim 1 as granted and claim 1 of the main request, when read on their own, provided protection for different subject-matter. The patent proprietor agreed that normally such a shift in the extent of protection would not be allowable. It argued, however, that the case at issue was very particular because the claims as granted did not embrace the subject-matter of the only example of the patent specification. The board had no doubts and the parties did not dispute that dendritic cells and monocytes were different cell types characterised by different features. Thus, the skilled person would a priori not have had any reason to read a different technical meaning into the term "obtaining from a blood sample a solution of dendritic cells". Reading the patent proprietor's interpretation into claim 1 would require the skilled reader to completely ignore the wording of granted claim 1, which per se was not technically meaningless, with the consequence that the wording of claim 1 would merely serve as an empty shell. This was clearly not in the sense of Art. 69 EPC nor in the sense of the protocol on its interpretation. Moreover, the interest of third parties in legal certainty would be completely ignored, if the patent proprietor's interpretation were found to be acceptable. The board came to the conclusion that the main request did not meet the requirements of Art. 123(3) EPC.

In T 2284/09 the effect of the amendment of claim 1 was to enlarge the scope of protection conferred by the claim as compared to the patent as granted. This contravened Art. 123(3) EPC. The appellant (patent proprietor) had relied upon decision T 108/91 (OJ 1994, 228), according to which, in the case of inconsistency between the claim and the totality of the disclosure, it was permissible to refer to the description and, pursuant to Art. 69(1) EPC, to rely on the disclosure of the description to amend the claim. T 108/91 was however not applicable in the case at issue, since there was no inconsistency between the claim of the granted patent and the description. Furthermore decision G 1/93 (OJ 1994, 541) ruled that in the case of a non-disclosed limitation being introduced during examination proceedings (as was the case here), it was not permissible to remove it when so doing would extend the scope of protection. In G 1/93 the role of Art. 69(1) EPC was also considered and it was concluded that the description was to be used for assessing in particular sufficiency of disclosure and in determining the scope of protection conferred by the claims. However, there was no finding in G 1/93 that supported the position of the appellant that the description might be used as a repository from which amendments to the claims could be derived even if such amendments would contravene Art. 123(3) EPC.

In T 1736/09 the board held that, in determining whether amendments made in opposition proceedings complied with the requirements of Art. 123(3) EPC, the protection conferred by European patent was determined by the claims of the granted patent, the description and drawings of the granted patent being used to interpret the claims in accordance with Art. 69(1) EPC and its Protocol. For the purpose of examination under Art. 123(3) EPC it

was irrelevant whether the granted patent met the requirements of Art. 123(2) EPC or Art. 76(1) EPC. See also T 2186/12.

In T 1896/11 the appellant submitted that, taking Art. 69 EPC into account, the description had to be used to interpret the claims; since the protection conferred by claim 5 of the patent as granted necessarily extended to what was stated in the description, claim 5 could be corrected to reflect the description without infringing Art. 123(3) EPC. However, the board held that, in the case at issue, the description could not be used to give a different meaning to a claimed method step which **in itself imparted a clear, credible, technical teaching** to the skilled reader. Otherwise third parties could not rely on what the claim actually stated. In order to determine whether the claimed method step in itself imparted a clear, credible technical teaching, it was necessary to examine "whether (a) the step as claimed was in itself meaningful and plausible from a technical point of view, and (b) whether there was, prima facie, any inherent incompatibility with the remaining features of the claim" (see T 1202/07). In the case in hand, the relevant feature was meaningful and plausible from a technical point of view.

2.3.2 Cut-off point

The decisions reported below, while likewise looking at the extent of protection, additionally address the question of whether the grant of the patent constitutes a cut-off point for making amendments to the application documents. As summarised in T 1481/14, the grant of a patent is not necessarily an automatic and final cut-off point ruling out any reinsertion of deleted subject-matter whatsoever. At best, the restrictions on further amendments to a patent under R. 80 and 138 EPC and Art. 123(3) EPC can be regarded as having such a cut-off effect.

In T 1149/97 (OJ 2000, 259) the board decided that, without opposition, issue of a decision to grant a European patent normally constituted a cut-off point for making amendments to the application documents in the European proceedings. If an opposition has been filed, cut-off effects due to the grant of a patent might be seen in the restrictions which R. 57a, R. 87 and Art. 123(3) EPC 1973 impose on further amendment of the patent specification. Although Art. 123(3) EPC 1973 addressed only the claims of the European patent, amendments to the description and the drawings might also extend the protection conferred in accordance with Art. 69(1) EPC 1973. If, in view of Art. 84 and Art. 69 EPC 1973, the application documents were adapted to amended claims before grant, thereby deleting part of the subject-matter originally disclosed in order to avoid inconsistencies in the patent specification, as a rule subject-matter deleted for this reason could not be reinserted either into the patent specification or into the claims as granted without infringing Art. 123(3) EPC 1973. An analogous finding applied to subject-matter retained in the patent specification during such adaptation for reasons of comprehensibility, but indicated as not relating to the claimed invention. See also T 37/99 and T 684/02.

In T 1481/05 the board distinguished the facts of its case from those underlying T 1149/97. It agreed with T 1149/97 that the "cut-off effect" finds its basis in Art. 123(3) EPC and that the test to be applied to determine whether this provision was infringed was the following:

Is it possible to identify some subject-matter which did not fall under the scope of protection in the granted version of the patent, but would do so if the amendment in question (the reintroduction of the deleted features) was allowed? Applying this test the board was unable to identify abandonment of subject-matter.

Likewise in T 81/03, the board detailed why it considered that the facts of the case dealt with in T 1149/97 (OJ 2000, 259) differed from those of the case in point. The board also held that amendments to a European patent could be based on the whole reservoir of features originally disclosed in the corresponding application, provided that Art. 123(3) EPC 1973 was not infringed by such amendments, due account being taken of the provisions of Art. 69(1) EPC 1973.

In T 241/02 in the board's view neither the fact that the appellant (proprietor) approved the text of the patent in suit nor considerations with respect to legal certainty added to the requirements relating to amendments in R. 57a or Art. 123(2) EPC 1973. The grant of a patent therefore did not necessarily constitute a final and automatic cut-off point ruling out any reinsertion of deleted subject-matter (in the case at issue, reinsertion of portions of the description relating to the process claimed). The opposition division had concluded on the basis of T 1149/97 (OJ 2000, 259) that reinsertion would not be possible, since it would contravene Art. 123(3) EPC 1973, but without referring to any specific parts or making any connection between parts to be reinstated and any concrete conclusion as to how the product claims would be extended in contravention of Art. 123(3) EPC 1973. The board decided that, by contrast with the situation in T 1149/97, in the case in point the appellant had deleted too much of the description, overlooking the relevance of parts of it to these remaining claims. According to the board, T 1149/97 did not lay down a strict rule. It required that an examination of a request for reinsertion be carried out with a view to establishing whether or not Art. 123(3) EPC 1973, on the facts of each case, was indeed infringed. The board decided to remit the case for further prosecution.

In T 975/03 the appellants (opponents) referred to decisions T 420/86 and T 61/85 in support of their argument, regarding the reintroduction of the feature of claim 1 deleted before the grant of the patent, that the appellant (patent proprietor) could not reinsert into the patent a feature it had deleted during the examination procedure, as such deletion was equivalent to abandonment. In the board's view, however, no legal grounds for the latter assertion were indicated in T 420/86 (or in T 61/85). This decision had also preceded the ruling in G 7/93 (see point 2.1 of the Reasons). The board held that the grant of a patent did not necessarily establish an automatic and final cut-off point which ruled out any reintroduction of deleted subject-matter. The amendment in the case at issue was therefore allowable, provided that it did not breach the requirements of R. 57a and Art. 123(2) and (3) EPC 1973. In the case at issue these requirements were met. The board also decided to refuse the request for referral of a point of law to the Enlarged Board of Appeal. After analysing the case law, the board concluded inter alia that none of the cases involved the constellation in which a feature was allowable under Art. 123(3) EPC 1973 but was then disallowed because of a supposed cut off effect or an abandonment. See also T 1481/14.

2.3.3 General claim interpretation

Decision T 190/99 gives guidance on how to interpret a claim as granted for the purpose of Art. 123(3) EPC. The skilled person, when considering a claim, should rule out interpretations which are illogical or which do not make technical sense. He should try, with synthetic propensity, i.e. building up rather than tearing down, to arrive at an interpretation of the claim which is technically sensible and takes into account the whole disclosure of the patent (Art. 69 EPC). The patent must be construed by a mind willing to understand, not a mind desirous of misunderstanding (this frequently cited decision was more recently referred to, for example, in T 1084/10, T 1190/11, T 1009/12, T 2002/13, T 640/14).

In T 2002/13 the board, assessing compliance with Art. 123(2) EPC, held that T 190/99 had ruled out illogical or technically meaningless interpretations of an otherwise technically meaningful feature of a claim. However, the case law did **not** allow the reader to **disregard an illogical or technically inaccurate feature** of a claim and hence to interpret such a feature in a correct manner. Thus, if a claim included contradictory features, this contradiction could not be resolved by merely disregarding the technically inaccurate features and by considering only the convenient technically meaningful features.

In T 287/11 the question to be answered was whether the claims of the main request covered any compositions or methods which were not covered by the claims as granted. The board considered decision T 999/10, which had been cited by the appellant, where it was stated that in view of the sequential ("cascade") formulation of the claim, there was no doubt as to the "intention" of the patent proprietor that no block copolymers other than the specific SIS-type might be present in the adhesive. The board in the case at issue held that the scope of protection should **not be interpreted**, however, **in the light of the intention of the drafter of a claim**, since this was a subjective criterion, but rather on the basis of the meaning generally accepted by the person skilled in the art to the technical features defined in said claim.

In T 1825/13 the board raised the question of whether the words "PQCA of a printing press" should be understood to be directed to the PQCA as such in the sense of "PQCA for a printing press ...", i.e. a PQCA that is suitable for a printing press as defined in the claim ("partial interpretation"), or to a printing press comprising the PQCA ("holistic interpretation"). In its preliminary opinion the board had leaned towards the "partial interpretation". However, in its decision, the board considered that some characterising features were not relevant for the PQCA as such, and this raised doubts as to whether the partial interpretation was appropriate. In order to clarify the scope of the claim, the board reverted to the description, which indicated that the "invention relates to a printing press having a PQCA ...". In addition, the board noted that during the examining proceedings the holistic interpretation had prevailed. Therefore, in view of the text of the patent as granted and in order to be coherent with the grant and opposition proceedings, the board adopted the holistic interpretation. In the assessment under Art. 123(3) EPC the board had considered in its preliminary opinion that the feature "by heat" in relation to a drying device was connected to the printing press but not to the PQCA; therefore, the deletion of this

feature did not infringe Art. 123(3) EPC. In its decision, however, in view of its new holistic interpretation, the deletion of the feature extended the scope of protection of the patent.

2.4. Deletions and replacements

2.4.1 Deletion of a limiting feature in a claim

A granted claim cannot be amended by deleting limiting subject-matter from the claims, because such amendment would extend the protection conferred, which is prohibited by Art. 123(3) EPC; if the limiting subject-matter had been added in contravention of Art. 123(2) EPC, the applicant is caught in an "inescapable trap", see G 1/93 and chapter II.E.3.1.

In T 1407/05 the board considered that claim feature A described essential technical characteristics of the claims as granted. Feature A was removed from the wording of the claims in all pending requests; all other claim features remained essentially the same. The board held that the removal of a positive technical feature from an independent claim prima facie resulted in a broadening of the scope of protection afforded by it and therefore contravened Art. 123(3) EPC.

In T 1983/14 the applicant had added a limiting feature to the claim during examination. The opposition division found that, as a consequence of adding this feature, the patent proprietor had lost its right to priority and its own use of the invention during the priority period had been prejudicial to novelty. The board agreed and held in addition that the problem of the added feature could not have been overcome by amendment. This was because Art. 123(3) EPC prevented the removal, after grant, of a problematic, limiting feature.

In T 666/97 the product claim of the auxiliary request no longer included a process feature which was included in the product claim as granted. In the board's view, it followed from the fact that the subject-matter for which protection was claimed in the auxiliary request was a product that it could only be characterised by features manifest in/on the product itself. That meant that manipulations taking place during product manufacture but not resulting in product features were of no relevance to the definition of the claimed product and hence to the scope of protection of the claim. That was an unavoidable implication of the established case law of the boards of appeal, under which the subject-matter of a **product-by-process claim** derives its novelty not from new procedural steps but purely from structural features (see T 205/83, OJ 1985, 363). Thus, to resolve the issue of compliance with the requirements of Art. 123(3) EPC 1973, what had to be decided was whether the omitted product-by-process feature was technically significant for the definition of the claimed product, i.e. whether it was a product feature. The board found that in the present case the omitted feature was not a product feature. Thus the claim had not been extended within the meaning of Art. 123(3) EPC 1973.

2.4.2 Deletion of important feature from description where claim remains unchanged

In T 142/05 the board found that, even where the wording of the granted claims was unamended and clear, the mere **deletion from the description of an important desired property** of the patented subject-matter led to an extension of the scope of protection which contravened Art. 123(3) EPC 1973 (this is different in the case of an optional, hence not important feature, see T 71/10). The question arose whether, although the wording of the granted claims remained unchanged, the mere fact of deleting the above sentence from the description could extend the protection conferred by the patent and lead to a violation of Art. 123(3) EPC 1973. Construed literally, this provision could be taken to mean that amendments to the description were not affected by this restriction, since only the patent claims were mentioned. The board concluded that, although the claims were the most important element in determining the extent of protection, **the wording of the claims should not be seen as the sole relevant factor**; instead, the description and drawings were to be used in interpreting the claims. From this, it followed that even if the wording of a claim was clear and unambiguous, i.e. where the scope of its literal meaning was clear, reference was still to be made to the description and claims. This could lead to a different interpretation of the claim, diverging from that obtained by considering only its literal meaning. Amendments to the description and drawings could modify the content of the claims and thereby extend the scope of protection according to Art. 69(1) EPC 1973, even where the wording of the claims was clear and remained unamended. In the board's view, the deletion in the case at issue had the effect of generalising the teaching of the patent. Art. 123(3) EPC 1973 had therefore been contravened.

2.4.3 Deletion of examples for a general feature in a claim

The board in T 1052/01 took the view that deleting examples given in claim 1 as granted (here "valve, restrictor, etc.") for a general feature (here "hydraulic functional unit") did not extend the protection conferred, as these examples were embraced by the general feature which determined the extent of the protection conferred.

2.4.4 Deletion of disclaimer referring to trade names

In T 532/08 the board held that, in the case at issue, the disclaimer could only be omitted without extending the scope of protection if it was beyond doubt that the components (of the disclaimed suspension) identified by trade names did not comprise any of the claimed tensides. However, it could not be unequivocally established what was excluded by a disclaimer referring to trade names, as a product designated by a trade name may change over time while keeping its name.

2.4.5 Deletion of a drawing

In T 2259/09, whilst the patent as granted comprised a set of Figures, in the amended patent according to the main request all drawings were deleted to comply with the requirements of Art. 123(2) EPC, and the description was correspondingly adapted. Concerning the examination of Art. 123(3) EPC, with the deletion of the drawings from the patent specification, technical information was undoubtedly lost. Whilst this loss of

information might also introduce some uncertainties about certain details of the preferred embodiments depicted in the drawings, it could not be concluded, as in the impugned decision, that it automatically broadened the protection conferred. In the case at issue, the claims were not limited to any of the details, dimensions or features specifically depicted in the (deleted) drawings. Moreover, under Art. 69(1) EPC, reference to the drawings of a patent specification may be helpful or even necessary if an ambiguity exists in the granted claim. However, in the case at issue, the impugned decision did not identify any such ambiguity; nor could the board see any. Therefore, the deletion of the drawings did not extend the scope of the protection conferred by the main request.

2.4.6 Deletion of feature in a claim mentioned "in particular"

In T.260/10 the feature "having at least one optical display unit and in particular at least one operating unit ..." in claim 1 as granted had been replaced and the words "and in particular at least one operating unit" thereby deleted. The board found that it generally **depended on the specific context** whether a feature following the expression "in particular" had to be regarded as optional. As a rule, an optional feature in the main claim was one which was not essential to the claimed teaching but instead served as an example illustrating other features. The wording used in claim 1 as granted meant that the claimed domestic appliance included not only an optical display unit but also an operating unit, the expression "in particular" having to be construed in the sense of "above all" or "especially". The operating unit was specified not as an example of a possible component, but rather as an essential part of the domestic appliance. In this case, "in particular" gave special emphasis to the operating unit as part of the appliance. The scope of protection was limited by this non-optional feature and its deletion therefore infringed Art. 123(3) EPC (see also T.916/08).

2.4.7 Deletion of a "preferred" feature in a claim

In T.795/95 the board did not share the appellant's view that deleting the feature "preferably polyvinyl or polyethylene" from the preamble of granted Claim 1 extended the protection conferred. The formulation "preferably polyvinyl or polyethylene" had no bearing on the scope of protection, which was determined by the more general term "plastic" and not the specific preferred substances polyvinyl or polyethylene. Deleting a "preferred" feature did not extend the scope of protection if such feature was encompassed by an earlier and general one (in this case, "plastic") which determined the protection conferred.

2.4.8 Reducing scope of claim by adding embodiments to a negative feature

In T.363/11 the board considered that the feature concerned was a negative feature, in the sense that it defined embodiments which were excluded from the claim. Since after the amendment more embodiments were excluded from claim 1 of the request than from claim 1 as granted, its scope was reduced vis-à-vis granted claim 1 and the requirements of Art. 123(3) EPC were satisfied.

2.4.9 Replacement of a restrictive term by a less restrictive term

In T 371/88 (OJ 1992, 157) the board held that Art. 123(3) EPC 1973 was not contravened if a restrictive term in a granted claim which in its strict literal sense did not embrace an embodiment set out in the description was replaced by a less restrictive term clearly embracing also this embodiment, provided two conditions were fulfilled: The restrictive term should not be so clear in its technical meaning in the given context that it could be used to determine the extent of protection without interpretation by reference to the description and drawings. Moreover, it had to be quite clear from the description and drawings and also from the examination procedure up to grant that the further embodiment belonged to the invention and that it was never intended to be excluded from the protection conferred by the patent (see also T 673/89 confirming T 371/88; T 738/95 distinguishing its case from T 371/88; T 750/02, which held that the first condition set out in T 371/88 was not fulfilled; T 749/03, which held that both conditions were met and which is summarised in chapter II.E.2.4.10 below).

In T 824/08 the board observed that the rationale of T 371/88 could not be applied in the case at issue since the limiting feature was clear in itself and did not pose any problems when determining the extent of protection conferred by the claim.

2.4.10 Replacement of an inaccurate technical statement in a claim

In T 190/99 the board stated with reference to T 108/91 (OJ 1994, 228) and T 214/91 that the amendment of a granted claim to replace an inaccurate technical statement, which was evidently inconsistent with the totality of the disclosure of the patent, with an accurate statement of the technical features did not infringe Art. 123(3) EPC 1973. The board added that the skilled person, when considering a claim, should rule out interpretations which were illogical or did not make technical sense.

In T 749/03 the respondent (patent proprietor) argued that a situation similar to the one in T 190/99 arose as claim 5 as originally filed would, if taken alone, not make technical sense, and even the simple addition of its features to the features of claim 1 would result in an inadequately defined apparatus. However, by taking into account the whole disclosure of the patent the skilled person might arrive at a technically sensible interpretation of the claim. The board based its reasoning on the approach taken in decision T 371/88 (OJ 1992, 157, summarised in chapter II.E.2.4.9 above), which concerned the admissibility of amending a granted claim to replace a restrictive term with a less restrictive term and defined two conditions: (a) the restrictive term in the granted claim was not so clear in its technical meaning in the given context that it could be used to determine the extent of protection without interpretation by reference to the description and the drawings of the patent; (b) it was quite clear from the description and the drawings of the patent and also from the examination procedure up to grant that the further embodiment belonged to the invention and that it had never been intended to exclude it from the protection conferred by the patent. In the case at hand (T 749/03), having regard to claim 1 alone, the features relating to the second (transmission) grating were perfectly clear in their technical meaning. However, in combination with claim 5 they would only make sense if reference were made to the description and drawings. Therefore

requirement (a) was met. Further, there could be no doubt that the applicant had not waived that embodiment. Hence requirement (b) was also met.

In T.1896/11 the appellant had replaced the parameter to be monitored in claim 5 of the patent as granted by a different parameter. According to the appellant, this was done because claim 5 of the granted patent contained an inaccurate technical statement and, since from the description it was clear what was obviously intended, claim 5 could be corrected to reflect this intention (with reference T.108/91), without violating Art. 123(3) EPC. The board disagreed and held that the skilled person would understand claim 5 of the granted patent as it stood and would not have any reason to suspect that it contained an inaccurate technical statement. Moreover, in accordance with G.1/93 (OJ 1994, 541), it was not allowable to replace a technical feature of a patent claim with another technical feature which caused the claim to extend to subject-matter which was not encompassed by the granted claim. As pointed out in T.195/09, in this respect decision T.108/91 had been clearly overruled by G.1/93.

2.4.11 Replacement of "cell of a plant" by "plant"

In T.579/01 independent claim 1 and dependent claims 2 to 6 of the new main request were directed to a "vegetable plant", while the respective claims as granted were directed to a "cell in a vegetable plant". The board decided that **any** plant as subject-matter of claim 1 of the new main request fell within the protection conferred by a claim to "a cell of a plant", and finally that the "plant" now claimed was characterised by the same genetic features as recited in the granted claim to "a cell of a plant". Also taking account of legislative developments in Europe in respect of the legal protection of biotechnological inventions (i.e. Art. 8.1 and 9 of Directive 98/44/EC), the board concluded that the amendment of the "cell of a plant" claim to a "plant" claim was not contrary to the requirements of Art. 123(3) EPC 1973.

2.4.12 Replacement of substance by device containing substance or substance with mechanical device

In T.352/04, claim 1 as granted had been directed to a hair-care composition defined only by its components, whereas claim 1 of the main request pending on appeal included a variant that additionally characterised it as "present in the form of a non-aerosol hairspray with a mechanical spray device". Observing that the dependent claims as granted had similarly made no reference to any device features, the board held that the addition of this mechanical spray device extended the protection conferred in breach of Art. 123(3) EPC 1973. Its inclusion as a separate element also changed the category of the claim, as it now encompassed a device containing the cosmetic composition too. See also in this chapter II.E.2.6. "Change of claim category".

In T.1898/07 the appellant (patent proprietor) argued that a claim referring to a packaged kit containing the liquid composition of claim 1 as granted was in fact narrower in scope than a claim referring to the liquid composition, as this claim encompassed the liquid formulation in any possible container, vessel, package or reservoir. The board agreed with the appellant in so far as the scope of protection covered by a claim referring to a physical

entity should be considered to encompass the physical entity in any possible package or container. However, it was self-evident that "a packaged kit" was a different physical entity than "a liquid composition". In the board's view the content of a package is not a characterising feature of the package per se. Thus, a procedural situation was created where an act, for instance the production of the box, package or other container, which did not infringe the patent as granted, became an infringing act as a result of an amendment after grant. It is precisely this situation which should be prevented by the requirements of Art. 123(3) EPC. A referral under Art. 112(1)(a) EPC was not justified since the board, which examined the teaching of cases T. 579/01 and T. 352/04 (amendment from cosmetic agent to combination of the agent with a mechanical device) referred to by the appellant, concluded that they did not apply in this case.

2.4.13 Replacement by aliud

In T. 867/05, the product claims as granted defined a composition of matter (membrane material of claims 1 to 9 and permselective material for use in dialysis of claim 12), whereas the amended product claims defined an apparatus (artificial kidney). The board considered that there had been a shift of the definition of the invention from a physical entity to a more complex physical entity which was not encompassed by the terms of the claims as granted. That shift implied that further components of an apparatus were encompassed by the terms of the present claims. This extended the protection conferred by claim 1 as granted to subject-matter which was foreign to that as granted (aliud), and so violated Art. 123(3) EPC. Likewise in T. 1321/05 the board saw the combination of two physical entities ("graphic marking film bonded to a vehicle") as a new physical entity different from the previously claimed entity ("graphic marking film"), considered this subject-matter as an aliud and the amended claim thus contrary to Art. 123(3) EPC.

In T. 547/08 the granted claim was directed to a user interface and screen display apparatus for a dialysis machine, the claim as maintained by the opposition division to a dialysis machine comprising user interface and screen display apparatus. In the board's view the scope of the claim as maintained had been **restricted** vis-à-vis that of the claim as granted since the subject-matter upheld explicitly comprised the dialysis machine as an additional feature. The board did not accept the appellant's arguments relating to the rights of the patent proprietor to sue for indirect or contributory infringement. In G. 2/88 (OJ 1990, 93) it was clearly ruled that it was not necessary to consider the national laws of the Contracting States in relation to infringement and that this issue was not relevant when deciding upon admissibility of an amendment under Art. 123(3) EPC. With respect to this question, it was rather appropriate to take into account that the protection conferred by a patent is determined by the terms of the claims, and in particular by the categories of the claims and their technical features, in accordance with Art. 69(1) EPC and its Protocol (G. 2/88). The board distinguished its case from those of T. 352/04 (change from a substance to a combination of the substance and a device) and T. 867/05 (change from a substance A for use in a method X to a combination of a device B and the substance A) and rejected the appellant's argument that the scope of protection had been shifted to an "aliud" in breach of Art. 123(3) EPC.

The board in T. 1296/11 held that – in contrast to, for example, T. 352/04, T. 867/05 and T. 321/07 – there had been no change of claim category because the same electro-mechanical device was claimed after the amendment as before. Citing the conclusion reached in T. 547/08, which had likewise involved the replacement of a specified purpose in the granted claim by a mandatory combination, it held that the protection conferred had not been extended within the meaning of Art. 123(3) EPC; on the contrary, the added features limited the protection.

For further cases, where the boards considered the amended claim to define an aliud, see e.g. T. 1675/08, T. 1779/09, T. 1701/10, T. 1578/13 and T. 2181/13; conversely for cases where the boards saw no shift to an aliud, see e.g. T. 820/98, T. 1818/11 and T. 1646/12.

2.4.14 Narrowing down a generic class or list of chemical compounds; open claims ("comprising"); sequential drafting ("cascade")

In T. 2017/07 the board stated that a composition which is specified in a claim to comprise a component in an amount which is defined by a numerical range of values is characterised by the feature which requires the presence of the component within that range, as well as by the implicit proviso which excludes the presence of that component in an amount outside of that range. Consequently, the amount of that component present in the composition must not exceed the upper limit of the numerical range indicated. An amendment restricting the breadth of that component, for instance by narrowing down a generic class or a list of chemical compounds defining that component, has the consequence of no longer requiring the presence within that numerical range of those chemical compounds no longer encompassed by the restricted definition of that component and, thus, of limiting the scope of this implicit proviso. A composition which is defined as comprising the components indicated in the claim is open to the presence of any further components, unless otherwise specified. Thus, in a claim directed to an openly defined composition, the restriction of the breadth of a component present therein may have the effect of broadening the scope of protection of that claim, with the consequence that in opposition/appeal proceedings such amended claim may extend the protection conferred by the granted patent (Art. 123(3) EPC).

With reference to T. 2017/07, the board in T. 9/10 held that the use of the term "comprising" in connection with a numerical range defining the amount of a component implicitly meant that the protection conferred by the claim did not extend to compositions containing that component in amounts outside the defined range.

In T. 999/10 the board considered that sequential drafting (formulation "en cascade") in an open claim ("comprising"), i.e. retaining in an amended claim the broad definition of claim 1 and adding, by means of the expression "and in which ...", an additional limitation, avoided the situation contemplated in T. 2017/07, where an amendment initially made with a view to limiting a claim in fact extended the scope of protection it conferred (Art. 123(3) EPC).

In T. 1360/11 the board confirmed that in a case where a granted claim, directed to a composition defined in an open manner and including the presence of a component belonging to a class or list of compounds in a quantity defined by a range, was later

amended by limiting the definition of the class or list of compounds, in spite of the apparent limitation, the wording of the granted and amended claims might be such that the amendment results in an extension of the protection conferred contrary to the requirements of Art. 123(3) EPC. The problem was well known in the case law, see e.g. T 172/07, T 2017/07, T 832/08, T 1312/08, T 869/10, T 287/11. The board observed that by means of inserting a **double condition** the claim may not extend the protection conferred by the patent. A possible infringement of the requirements of Art. 123(3) EPC might be avoided by including in the amended claim a **quantitative condition on the limited class or list of compounds** and an **additional constraint** on the total amount of compounds belonging to the broader class or list. See also T 514/14 and T 1063/15.

In T 491/13 the board distinguished the case at issue from the above cited cases, since it did not relate to a restriction from a list of compounds comprising one or more of said compounds (here the solvent) or a mixture thereof, or to a list defined broadly as a general chemical class or a broad chemical formula. In addition, the situation also did not apply to the case at issue, since the protection conferred by claim 1 as granted extended to compositions containing the selected component in amounts inside the defined range and potentially one or more supplementary unselected compounds in any range.

In T 306/14 the board considered that a possible way out of the situation was a sequential drafting of the claim (formulation "en cascade" as in T 999/10). Alternatively, T 1360/11 held that the result of amending the claim by inserting a "double condition" was that the claim did not extend the protection conferred by the patent. In the case in hand, the appellant had chosen the second possibility and amended the claim by including a further limitation of the total amount of the milled filler (double condition). The board agreed with the respondent/opponent that the claims were not identical to the claims in decision T 1360/11, wherein the added condition also specified the amount of the specific components, but the idea was exactly the same. Adding the second condition ensured that the total amount of milled filler remained within the scope of the granted claims.

2.4.15 Replacement of drawings

In T 236/12 the drawings published in the patent specification had been replaced by those originally filed. Although the published drawings had disclosed technical information not derivable from those originals, their replacement did not broaden the scope of the patent. The technical features of the claims were explained in sufficient detail in the description, as read together with the originals, so the skilled person could still get a clear idea of the protected subject-matter and how it should look.

2.5. Transposition of features within claims

In T 16/86 the board pointed out that it was the subject-matter of the claim as a whole which embodied the invention. Therefore, in so far as a change in the position of a feature inside a claim did not alter its meaning, the extent of protection conferred remained unchanged and such an amendment contravened neither Art. 123(2) nor Art. 123(3) EPC 1973.

In T. 160/83 the board had no objection to the appellants' amendment of the characterising clause so as to include a feature which was previously in the preamble but not shown in the document representing the closest state of the art.

In T. 96/89 the board again allowed the transposition of features from the preamble of a claim to its characterising portion. This did not alter the subject-matter claimed, and thus did not extend the scope of protection. Nor was it in breach of Art. 123(3) EPC 1973 if terms were first generalised in the preamble, then trimmed back in the characterising portion to the subject-matter originally disclosed. R. 29(1) EPC 1973 required that claims be delimited against the nearest prior art; before the preamble to an independent claim could be drafted at all it was often necessary to select from two restrictive terms (the subject-matter claimed and the closest prior art) a general term covering both.

In T. 49/89 the subject-matter of granted claim 1 had been limited during opposition proceedings to a special embodiment according to granted dependent claim 2. The board held that the protection had not been extended because new claim 1 indicated all the features in granted claim 1 and the newly incorporated features were merely elaborations on those contained in granted claim 1. The extent of protection conferred by a European patent was determined by the content of all claims, not that of one or several only. Thus, for example, even though an independent claim lacked novelty a claim dependent on it could still be valid and the patent proprietor could restrict himself to that claim. It was, moreover, irrelevant when determining the extent of protection whether features were referred to in the prior art portion or characterising portion. The transposition of information from one to the other did not therefore contravene Art. 123(3) EPC 1973 (T. 579/01, T. 411/02, T. 250/02, T. 1898/07).

2.6. Change of claim category

In G 2/88 (OJ 1990, 93) the Enlarged Board stated that a change of category of granted claims in opposition proceedings was not open to objection under Art. 123(3) EPC 1973, if it did not result in extension of the protection conferred by the claims as a whole, when they were interpreted in accordance with Art. 69 EPC 1973 and its Protocol. In this context, the national laws of the contracting states relating to infringement should not be considered, for there was a clear distinction between the protection which was conferred and the rights which were conferred by a European patent. The **protection conferred by a patent** was determined by the terms of the claims (Art. 69(1) EPC 1973), and in particular **by the categories of such claims and their technical features**. In contrast, the rights conferred on the proprietor of a European patent (Art. 64(1) EPC 1973) were the legal rights which the law of a designated contracting state might confer upon the proprietor. In other words, in general terms, determination of the "extent of the protection conferred" by a patent was a determination of what was protected, in terms of category plus technical features; whereas the "rights conferred" by a patent were related to how such subject-matter was protected. When deciding upon the allowability of an amendment involving a change of category, the considerations were, in principle, the same as when deciding upon the allowability of any other proposed amendment under Art. 123(3) EPC 1973.

2.6.1 From product claim to a claim directed to the use of the product

a) Different categories of use claims

Enlarged Board decision G 2/88 (OJ 1990, 93) related to a change of claim category in opposition proceedings, and in particular to the change from a product claim to a claim directed to the use of the product for a particular purpose, which the Enlarged Board allowed. The **protection conferred by a patent** was determined by the terms of the claims (Art. 69(1) EPC 1973), and in particular **by the categories of such claims and their technical features**. An amendment of granted claims directed to "a compound" and to "a composition including such compound", so that the amended claims were directed to "the use of that compound in a composition" for a particular purpose, was not open to objection under Art. 123(3) EPC 1973. For it was generally accepted as a principle underlying the EPC that a patent which claimed a physical entity per se, conferred absolute protection upon such physical entity, for all uses of such physical entity, whether known or unknown. It followed that if it could be shown that such physical entity (e.g. a compound) was already part of the state of the art, then a claim to the physical entity per se lacked novelty. It also followed that a claim to a particular use of a compound was in effect a claim to the physical entity (the compound) only when it was being used in the course of the particular physical activity (the use), this being an additional technical feature of the claim. Such a claim therefore conferred less protection than a claim to the physical entity per se.

However, the Enlarged Board distinguished between use claims, which define the use of a particular physical entity **to achieve an "effect"**, and claims which define such a use **to produce a "product"**. The latter type of claim was a process claim within the meaning of Art. 64(2) EPC 1973.

In T 401/95 the board, with reference to G 2/88 (OJ 1990, 93), identified two different categories of use claim, namely

- (i) the use of a physical entity to achieve an effect, and
- (ii) the use of a physical entity to produce a product.

A use claim of the latter category (ii) is to be considered as a process claim comprising physical steps for producing the product using the physical entity with the consequence that this type of use claim is a process claim within the meaning of Art. 64(2) EPC 1973. Pursuant to that article, the product insofar as it is **directly obtained** by that process, is also protected. Hence, the product, when obtained by that process, is within the scope of protection conferred by that type of use claim. Consequently, the use claim as amended conferred protection to the claimed use and to the product directly obtained by the claimed process, which, in the case at issue, extended the protection conferred (for a case where the issue of Art. 64(2) EPC 1973 was not considered, see however T 879/91).

The board in T 75/90 allowed a switch from a claim for a "transport box ... adapted for the method according to one of the claims 1 to 3" to one for the "use of transport box adapted for the method".

b) From product claim to a claim directed to using a product to achieve an effect

In T 134/95 a patent had been granted in respect of a "container for medical use", designed for the separate storage and the mixing of compounds. The protection conferred therefore related to the apparatus and, necessarily, to its use at least for the purposes of storage and mixing. After amendment, the claim became a use claim, covering only the use of the container and no longer protecting the apparatus as such. Having pointed out that inventions of this kind were designed with a particular object in mind and could not normally be used for other purposes, the board noted that in this case, the change of category, replacing the granted claim with a claim for the use of the container, had the effect of limiting the scope of protection. The two stages of the process therefore in no way had the effect of modifying the starting solutions with a view to obtaining or manufacturing a product. This use therefore fell into the category "use of a physical entity to obtain an effect or result" (see G 2/88, OJ 1990, 93), and on this basis the change of category was allowable.

A change from a product claim to a claim for the use of the product to produce an effect was also allowed in T 568/94, T 78/97, T 977/02.

c) From product claim to a claim directed to using a product for producing another product
– Article 64(2) EPC

In T 912/91 the board held that the change of claim category from the granted product claims for composite bodies to use of graphite for obtaining a sintered composite ceramic body having certain characteristics did not broaden the scope of protection of the granted claims. Even if it were considered that the use claim was notionally equivalent to a claim to a process including the step of using the graphite in the sintered body and that the effect of Art. 64(2) EPC 1973 was to confer protection on the product resulting from this process as well, this would not represent an extension of protection within the meaning of Art. 123(3) EPC 1973, since the sintered composite body was defined in the use claim in a more restricted way than the composite body of the granted claim (narrower range of the graphite content, etc.).

T 37/90 allowed the change from a claim to a product comprising a certain material to the use of the material for the manufacture of the product.

In T 282/09 the claims of the main request as amended comprised only use claims, which had replaced the product claims directed to a physical entity of the patent as granted. The board held that according to EPO practice (see T 401/95) a claim directed to "the use of a physical entity to produce a product" was to be considered as a process claim comprising physical steps for producing the product using the physical entity, with the consequence that this type of use claim was a process claim within the meaning of Art. 64(2) EPC. Pursuant to that article of the EPC, the product, insofar as it was directly obtained by that process, was also protected. Hence, the product, when obtained by that process, was within the scope of protection conferred by that type of use claim (see decision G 2/88, OJ 1990, 93, point 5.1 of the Reasons). In the case at issue, the protection conferred after amendment extended beyond that conferred before, contrary to the requirements of

Art. 123(3) EPC, because the product obtained using the physical entity was not protected before the amendment of the claims, but was now protected as a result of the amendment. See also T 1471/14.

In T 1954/12 claim 3 as granted was to a cell characterised by the presence of a recombinant nucleic acid encoding VKOR. Claims 2 and 3 of the main request were directed to the use of the cell of granted claim 3 for making a VKD protein. The board observed that a distinction had been made in G 2/88 between "a patent whose claimed subject-matter is the use of a product to achieve an effect ... [and] ... a patent whose claimed technical subject-matter is a process of manufacture of a product". For this latter case, it was stated with reference to Art. 64(2) EPC that "protection is conferred not only upon the claimed process of manufacture, but also upon the product resulting directly from the manufacture". The board noted that the methods of claims 2 and 3 were directed to the manufacture of a particular product, namely a VKD protein, and thus, the protection conferred by these claims was not limited to the claimed process of manufacture but extended also to this product. The protection conferred by granted claim 3 did not extend to this product and, in this regard, the protection conferred by claims 2 and 3 went beyond the protection conferred by granted claim 3. However, decision G 2/88 required **comparing the totality of the claims before and after the amendment**. In the case at issue, the protection conferred by granted claims 4-7 extended, in accordance to Art. 64(2) EPC, to the product obtained, i.e. a VKD protein. The board came to the conclusion that granted claims 4-7 provided protection for the product obtained by the methods of claims 2 and 3 of the main request, namely a VKD protein. The requirements of Art. 123(3) EPC were fulfilled.

2.6.2 From product or product-by-process claim to a claim directed to a process for manufacturing/preparing the product, and vice versa

According to established case law, a product claim confers protection to all processes for making that product, such that the replacement of a claim directed to a product by a claim directed to a specific process or method for making that product does not extend the protection conferred thereby (T 674/02 with reference to T 54/90, T 28/92, T 468/97, T 554/98; see also T 191/90, T 762/90, T 153/91, T 601/92, T 646/98, T 425/02, T 1139/06).

In T 423/89 the change in category from a product-by-process claim to a manufacturing process claim was admissible. In T 402/89, however, the board pointed out, in passing, certain difficulties in interpreting the term "protection conferred".

In T 5/90 the patent was granted with a claim in the form "a product having product features x and product-by-process features characteristic of process steps y". This claim, however, turned out not to be novel. The patentee finally claimed "a process of making a product having product features x by using process steps y and process steps z". The board interpreted such a claim as covering the process steps only in so far as a product having product features x actually resulted. This was called a **process-limited-by-product claim** by the board. The direct product of this process would also be protected under the provisions of Art. 64(2) EPC 1973, but such product inevitably fell within the scope of the

product claim originally granted. The board regarded a process-limited-by-product claim of this type as clearly complying with the requirements of Art. 123(3) EPC 1973 because it would only be infringed if the product fell within the originally granted product claim and in addition the particular form of manufacture using process steps z was used (see also T 562/04).

In T 20/94 the patent as granted exclusively comprised process claims for preparing a product. In the form as amended it comprised a product claim relating to the product per se. The board stated that the protection conferred by a claim directed to a process for preparing a product covered a product directly obtained by that process (Art. 64(2) EPC 1973), but it was not protected when obtained by any other process. However, the protection conferred by a claim directed to a product per se was absolute upon that product. The product claim thus conferred protection on that product regardless of the process by which it was prepared. The appellant attempted to overcome this objection by formulating the product claim as amended in the form of a product-by-process claim using the term "directly obtained". The board did not agree with this line of argument, stating that a product-by-process claim was interpreted as a claim directed to the product per se, since the only purpose of referring to a process for its preparation was to define the subject-matter for which protection was sought, which was a product. Thus amended claim 1 in the case in question contravened Art. 123(3) EPC 1973.

In T 1206/01 the board pointed out that according to the established case law of the boards of appeal a product claim conferred protection on the claimed product, regardless of the process or method by which it was prepared. Therefore a change of category from a granted product claim to a process claim restricted to one or more methods of preparing the product did not extend the protection thereby conferred.

2.6.3 From a product claim to a product-by-process claim

In T 794/03 claim 1 as granted had been a substance claim for a plain-bearing composite material, preferably for manufacturing bearing bushes, whereas claim 1 according to the main request pending on appeal was for a plain-bearing bush made of the (in the meantime, limited) composite material. The board found that this amended claim amounted to a kind of "product-by-process" claim, which meant that, in order to determine the extent of protection it conferred, it had to establish what features the process lent the end product. It concluded that the scope of protection had indeed been extended.

2.6.4 From method claim for treating the human body by therapy to product claim

In T 426/89 (OJ 1992, 172) claim 1 as granted and claim 1 of the main request related to a process for operating a pacemaker. The board noted that an actual operating method for a pacemaker for arresting a tachycardia would necessarily be a method for treating the human (or animal) body by therapy, and would not be patentable. However, the board agreed with the patentee that the claim referred to the steps in a technical method which did not define a method of treatment but rather, in functional terms, the structural features of a pacemaker. However, the board found the claim to be contrary to Art. 84 EPC 1973. The differences between the claim 1 according to the auxiliary request and the granted

version were that in claim 1 the terms "Method for the operation of a pacemaker", had been replaced by "Pacemaker". The board held that claim 1 as granted was already a product claim containing a functional definition of a pacemaker. So the seeming change of category did not alter the content of the claim but simply served to clarify it (see also T 378/86, OJ 1988, 386).

In T 82/93 (OJ 1996, 274) claim 1 as granted related to a method of operating a pacer. The board found that this claim defined a method for treatment of the human body by therapy and therefore was not allowable under Art. 52(4) EPC 1973. It held that the device claim of the auxiliary request was not allowable under Art. 123(3) EPC 1973. The subject-matter protected by the granted claim was a pacer, **when in use**; in contrast, the claim of the auxiliary request only included technical features which defined physical characteristics of the pacer device itself. The board explained that in general terms, if a patent as granted only included claims defining the operation of a device and therefore **containing both "device features" and "method features"**, and the proposals to amend the patent during opposition proceedings included claims which only contained "device features", the proposed amendment was not allowable having regard to Art. 123(3) EPC 1973, because the patent as granted conferred protection upon the device only when it was in use so as to carry out the method, whereas the proposed amended patent would confer protection upon the device whether or not it was in use, and would therefore confer additional protection compared to the patent as granted. In contrast to the findings in T 426/89, in the case at issue the board held that claim 1 as granted was clear, defined the use of a device to carry out a method of treatment of the human body by therapy and was not a pure "device claim" since it also included method steps. Thus, under such circumstances, Art. 52(4) and Art. 123(3) EPC 1973 might operate in combination as an "inescapable trap".

2.6.5 From use claim to process claim, and vice versa

In T 279/93 the board found that a claim to the use of a compound A in a process for preparing compound B had no broader scope than a claim to a process for preparing compound B from compound A. It had already been stated in G 2/88 (point 2.5 of the Reasons) that the technical features of a claim to an activity were the physical steps which defined such activity. In this case, the board considered that process claim 1 as filed, process claim 1 as granted and use claim 1 filed on appeal all related to the same physical steps, and that the claims were therefore of the same scope. On this view, the scope of protection conferred by this use claim was not broader than that conferred by the granted process claim (see also T 619/88).

In T 420/86 a change from a claim for a process for treating soil, in which X was used, to a claim for the use of X for treating soil was allowed. In T 98/85 on the other hand, a change from a "process for the preparation of a ... composition" to the "use of this ... composition as a ..." was seen as a breach of Art. 123(3) EPC 1973.

In T 276/96 the board decided in view of G 5/83 (OJ 1985, 64) that the change of claim of the type "Method of fabricating item A using item B providing effect C" to a claim of the type "Use of item B in a method of fabricating item A to provide effect C" did not extend

the protection conferred, since with both formulations the same activity would be forbidden to competitors.

In T 22/09 of 5 February 2016 the board held that since claim 1 as granted concerned a method of pre-treating a catalyst support, which by virtue of Art. 64(2) EPC extended the protection conferred to the pre-treated catalyst support directly obtained by the claimed method, and since instead claim 1 according to the new request concerned the use of a modifying component for suppressing the solubility of a catalyst support, i.e. defined the use of a chemical compound to obtain a particular effect on the catalyst support, the protection conferred by the patent as granted had not been extended.

2.6.6 From use claim to Swiss-type claim

In T 1635/09 (OJ 2011, 542) claim 1 in the 23rd auxiliary request differed from claim 1 in the granted text in that the originally granted use claim was converted to the so-called Swiss form of claim, i.e. a claim for the use of a substance or mixture of substances for manufacturing a medicament for a specific therapeutic use. Under the established jurisprudence of the boards of appeal, when establishing whether the scope of protection was extended by this amendment all the granted claims must be taken into consideration. It was therefore necessary to determine whether the reformulation of a claim for the "use of an oral dosing form comprising ... for contraception ..." into a claim for the "use of a composition comprising ... for manufacturing an oral ... dosing form for contraception ..." complied with the requirements of Art. 123(3) EPC. A crucially important question here was whether the Swiss-type claim was to be regarded as for (a) the use of a substance or mixture of substances for a specific purpose or (b) the manufacture of a medicament. Citing G 5/83 (OJ 1985, 64) and G 2/88 (OJ 1990, 93), the board in T 1635/09 ruled that the conversion of a claim for the use of a substance or mixture of substances for a specific purpose into a Swiss-type claim or a product claim limited to a specific use in accordance with Art. 54(5) EPC results in an extension of the scope of protection.

2.6.7 From Swiss-type claim to purpose related product claim under Article 54(5) EPC

In T 250/05 the board held that, apart from the fact that Art. 54(5) EPC (entry into force 13 December 2007) did not apply to a patent granted in 2001, Art. 123(3) EPC would not allow the change of category of a granted use claim into a product claim, even if drafted as a purpose-related product claim. Therefore, in the case at issue, the amended claims had to remain in the "Swiss form" in order not to contravene Art. 123(3) EPC.

In T 1780/12, in the context of double patenting, the board understood that the board in T 250/05 had considered that the scope of protection conferred by a purpose-related product claim was in fact larger than the scope of protection conferred by a Swiss-type claim. See also T 879/12.

In T 1673/11 claim 1 of the main request was drafted in the format of a purpose-limited product claim as provided for by Art. 54(5) EPC, whereas all claims as granted had been in the so called "Swiss-type" form. For the respondent, the protection conferred by both types of claims was the same. The board disagreed. The purpose-limited product claim

conferred protection on the product, whenever it was being used for the treatment of infantile Pompe's disease. Since the claim did not refer to a step of manufacture of a medicament, the product claimed was not limited to a manufactured medicament, packaged and/or with instructions for use in the treatment of infantile Pompe's disease. Even if by virtue of Art. 64(2) EPC the protection conferred by granted claim 1 extended to the product directly obtained by the manufacturing process referred to in said claim, the protection conferred by claim 1 of the main request was broader. Nor could the board follow the appellant's argument that since the use limitation of the claims of the main request and of the granted claims was the same, their scope of protection was identical. For example, once the patent was amended, a medicament containing the product, packaged and provided with instructions for the use in a treatment other than that of infantile Pompe's disease was encompassed by the scope of claim 1 of the main request when said medicament was being used for the treatment of infantile Pompe's disease. The protection conferred by granted claim 1 did not encompass such use. The board concluded that the amendment of the contested patent in such a way extended the protection it conferred, contrary to Art. 123(3) EPC.

3. Relationship between Article 123(2) and Article 123(3) EPC

This chapter concerns the "inescapable trap" of Art. 123(2) EPC in combination with Art. 123(3) EPC when the applicant inadmissibly adds a limiting feature to the claim. A similar trap may exist in the situation in which there is no violation of Art. 123(2) EPC but a lack of novelty due to loss of priority, see T 1983/14 summarised in chapter II.E.2.4.1 above. For the situation in which an unclear feature (Art. 84 EPC) is deleted from the claim and the argument that this also might lead to an "inescapable trap", see T 81/13 summarised in chapter II.E.1.4.7 above.

3.1. Inescapable trap

In T 384/91 (OJ 1994, 169) the question was referred to the Enlarged Board whether, given the requirements of Art. 123(2) and (3) EPC 1973, a patent could be maintained in opposition proceedings if its subject-matter extended beyond the content of the application as filed, whilst at the same time the added feature limited its scope of protection. The conflict here was that the "limiting extension" had to be deleted as a breach of Art. 123(2) EPC 1973, but to do so would broaden the scope of the patent and thus contravene Art. 123(3) EPC 1973 (see G 1/93, OJ 1994, 541).

This problem had been extensively discussed for the first time in T 231/89 (OJ 1993, 13), where the board held it to be inappropriate to take Art. 123(2) and 123(3) EPC 1973 as independent of each other while applying them in conjunction to revoke the patent.

In G 1/93 (OJ 1994, 541) the Enlarged Board of Appeal ruled as follows:

If a European patent as granted contained subject-matter which extended beyond the content of the application as filed within the meaning of Art. 123(2) EPC 1973 and which also limited the scope of protection conferred by the patent, such patent could not be maintained in opposition proceedings unamended, because the ground for opposition

under Art. 100(c) EPC 1973 prejudiced the maintenance of the patent. Nor could it be amended by deleting such limiting subject-matter from the claims, because such amendment would extend the protection conferred, which was prohibited by Art. 123(3) EPC 1973. Therefore, in principle, if the European patent as granted contained a "limiting extension", it had to be revoked. Art. 123(2) and 123(3) EPC 1973 were mutually independent of each other (T.1736/09: by analogy, Art. 76(1) EPC and Art. 123(3) EPC must also be regarded as mutually independent of each other). In this sense, it had to be admitted that Art. 123(2) EPC 1973 in combination with Art. 123(3) EPC 1973 could operate rather harshly against an applicant, who ran the risk of being caught in an **inescapable trap** and losing everything by amending his application, even if the amendment was limiting the scope of protection. However, this hardship was not per se a sufficient justification for not applying Art. 123(2) EPC 1973 as it stood in order to duly protect the interests of the public. Nor did it, in principle, matter, that such amendment had been approved by the examining division. The ultimate responsibility for any amendment of a patent application (or a patent) always remained that of the applicant (or the patentee).

3.2. Attempts to resolve the conflict

The Enlarged Board in G 1/93 (OJ 1994, 541) mentioned three instances where the patent could be maintained:

- If the added feature could be replaced by another feature disclosed in the application as filed without breaching Art. 123(3) EPC 1973, the patent could be maintained (in amended form). This might turn out to be a rare case in practice (see below T.166/90).
- An added undisclosed feature without any technical meaning could be deleted from a claim without violating Art. 123(3) EPC 1973.
- An added feature, which did not provide a technical contribution to the subject-matter of the claimed invention but merely limited the protection conferred by the patent as granted by excluding protection for part of the subject-matter of the claimed invention as covered by the application as filed, was not considered as subject-matter which extended beyond the content of the application as filed within the meaning of Art. 123(2) EPC 1973. In this case also the patent could be maintained. See below, chapter II.E.3.3. "Addition to the claim of an undisclosed feature limiting protection conferred, without providing a technical contribution".

The board noted in T.335/03 that, according to G 1/93, there was no basis in the Convention for providing a claim with a footnote to the following effect; "This feature is the subject of an inadmissible extension. No rights may be derived from this feature"; in other words, in cases of conflict between Art. 123(2) and Art. 123(3) EPC 1973 the **footnote solution is inadmissible** (see also T.307/05 and T.614/12).

In T.10/91 a neutral feature of no particular value for the skilled person was added during the examination proceedings. The feature had no technical significance. It could therefore

stay in the claim, but could not be taken as delimiting when examining for novelty and inventive step.

In T 938/90, however, the addition was technically significant and it had to be taken into account in the examination for novelty and inventive step. The board therefore declined to apply the principles developed in T 231/89 and dismissed the patent proprietor's appeal against the revocation of the patent (see T 493/93).

In T 166/90 the board allowed an inadmissible feature in a granted claim to be replaced by other disclosed features, since this did not extend the scope of protection. The invention concerned an opaque plastic film. The product claim as granted contained a feature stating that the density of the film was less than the arithmetical density from the type and proportion of the individual components. In opposition proceedings the patent proprietor claimed a process for manufacturing the film, but without including in his process claim the density-related feature. The board examined whether this would broaden the scope of the patent, asking if the process claim features which replaced the deleted feature necessarily limited the claim to films – like that in the granted product claim – with a density less than the arithmetical one. The board concluded that, with a probability bordering on certainty, the process now claimed would produce an opaque film of a density less than that arithmetically derivable from the type and proportion of its individual components. Thus, deleting the density-related feature had not in fact extended the scope of protection.

Decision T 438/98 followed T 271/84 (OJ 1987, 405), T 371/88 (OJ 1992, 157), T 673/89 and T 214/91, in ruling that amending a claim to remove an inconsistency did not contravene Art. 123(2) or Art. 123(3) EPC 1973 if the claim as corrected had the same meaning as the correct interpretation of the uncorrected claim in the light of the description. For another case concerning the conflict between Art. 123(2) and (3) EPC, see T 1202/07, which refers to T 1018/02 (extent of protection conferred by a claim feature not consistent with the description). The latter decision dealt in detail with interpretation of claims and can thus be distinguished from, in particular, T 438/98 (correction of an obvious clerical error).

In T 553/99 the board stated that if a claim as granted contained an undisclosed, limiting feature in contravention of Art. 123(2) EPC 1973 it could be maintained in the claim without violating Art. 123(2) EPC 1973 provided that a further limiting feature was added to the claim which further feature was properly disclosed in the application as filed, and deprived the undisclosed feature of all technical contribution to the subject-matter of the claimed invention.

T 942/01 held it to be a principle in patent law (see for example G 1/93, OJ 1994, 541) that a patent could not be maintained unamended in opposition procedure if a violation of Art. 123(2) EPC 1973 had occurred during the examination procedure. A cancellation of unallowable amendments during the opposition proceedings was normally possible under the provisions of the Convention, except where the unallowable amendment was a "limiting extension", so that its cancellation would extend the protection conferred by the patent and therefore contravene the requirements of Art. 123(3) EPC 1973 (G 1/93). However, the case at issue dealt with an unallowable extension only. The feature, which

was present in the claim of the application as filed and now reintroduced in the claim, did not extend the protection conferred by the claims but rather restricted it.

T 567/08 gives an example of a "limiting extension" adding subject-matter contrary to Art. 123(2) EPC but at the same time limiting the scope of protection vis-à-vis what could have been claimed, so that its removal infringed Art. 123(3) EPC.

In T 250/05 the board, following the principles set out in G 1/93, came to the conclusion that the patent could not be maintained unamended **and** that the patent could only be maintained if there was a basis in the application as filed **for replacing** such subject-matter without violating Art. 123(3) EPC. The sixth auxiliary request (which contained only one claim) met both prerequisites.

In T 195/09, on the conflict between Art. 123(2) and (3) EPC, the appellant referred to T 108/91 in which it had been decided that an inaccurate technical statement in a granted claim, which statement was evidently inconsistent with the totality of the disclosure of the patent and would contravene the requirements of Art. 123(2) EPC, could be replaced with an accurate statement of the technical features involved without infringing Art. 123(3) EPC. The board in T 195/09 pointed out that this decision had been clearly overruled by G 1/93 (on T 108/91, see also T 1202/07, T 1896/11).

In T 1180/05 the board, on the basis of decisions G 1/93 and G 1/03 dealing with Art. 123(2) and (3) EPC 1973 and with disclaimers, came to the conclusion that the deletion of a feature in a granted claim, which feature extended beyond the content of the application as filed, and its reintroduction in the form of a disclaimer, so that the subject-matter of the claim remained the same, was not suitable to overcome the potential conflict between paragraphs 2 and 3 of Art. 123 EPC 1973. The board decided not to refer the question to the Enlarged Board of Appeal as requested by the patent proprietor. The decision of the opposition division maintaining the patent in amended form was set aside and the patent revoked.

3.3. Addition to the claim of an undisclosed feature limiting protection conferred, without providing a technical contribution

G 1/93 (OJ 1994, 541) stated that the underlying idea of Art. 123(2) EPC 1973 was clearly that an applicant should not be allowed to improve his position by adding subject-matter not disclosed in the application as filed, which would give him an unwarranted advantage and could be damaging to the legal security of third parties relying on the content of the original application. If, however, an added feature merely excluded protection for part of the subject-matter of the claimed invention as covered by the application as filed, the adding of such a feature could not reasonably be considered to give any unwarranted advantage to the applicant. Nor did it adversely affect the interests of third parties. Therefore, a feature which had not been disclosed in the application as filed but which had been added to the application during examination was not to be considered as subject-matter which extended beyond the content of the application as filed within the meaning of Art. 123(2) EPC 1973, if it **merely limited the protection conferred** by the patent as granted by excluding protection for part of the subject-matter of the claimed invention as

covered by the application as filed, **without providing a technical contribution** to the subject-matter of the claimed invention (see also T.112/95).

These principles were in general confirmed in G 2/10 (OJ 2012, 376), see also G 2/98 (OJ 2001, 413). Pursuant to G 2/10 it was, however, evident from the context that by introducing the "technical contribution" criterion in G 1/93 the Enlarged Board had not intended to amend the definition concerning when an amendment was allowable under Art. 123(2) EPC generally, but that it only had sought a way of avoiding the potentially fatal consequences of the patentee being caught in the "inescapable trap" between the requirements of Art. 123(2) and (3) EPC.

The question of whether an added feature made a technical contribution or merely limited the scope of protection was discussed in several decisions.

In T.384/91 (OJ 1995, 745) it was held that the added feature did make a technical contribution. This decision was based on the following considerations: the example mentioned by the Enlarged Board illustrated a case where the feature was clearly not merely a limitation. However, the borderline beyond which a feature was no longer to be considered as making a technical contribution to the subject-matter of the claimed invention and was merely limiting the protection conferred, was not co-terminous with this example but lay between it and the limit of complete technical irrelevance. According to the board this view was consistent with the fact that the Enlarged Board had rejected relevance as a criterion for novelty and inventive step, which would also have implied a comparison with the cited prior art documents. The board explained that the term "invention" did not necessarily imply the presence of novelty and inventive step, as was apparent from the wording of Art. 52, 54 and 56 EPC 1973. The board concluded that there was no need to take into account the prior art documents, but that the assessment of whether the exception for mere limitations applied in a particular case should depend only on the **technical relationship** of the added feature to the content of the application as originally filed, as understood by a skilled reader. At the least, a feature went beyond providing a mere limitation not involving a technical contribution to the invention if it interacted with the way in which the other features of the claim solved the technical problem, as it was understood from the application as originally filed.

In case T.64/96, a patent relating to a cover for automobile sun visor mirrors comprising rectangular plates overlapping and connected together in chain-like succession was revoked by the opposition division. The third auxiliary request of claim 1 was amended in that it was included as an additional feature that lugs were "integrally formed in said plates". The board came to the conclusion that applying the criterion, as set out in G 1/93 (OJ 1994, 541) and T.384/91 (OJ 1995, 745), to the case at issue, it could be seen that the feature in question did indeed make a technical contribution to the subject-matter of the claim since forming the lugs integrally with the plates led to a simpler and cheaper construction of cover which, at least by implication, was the technical problem which the invention set out to solve. Thus the addition of this feature to claim 1 of the third auxiliary request offended against Art. 123(2) EPC 1973.

In T 518/99 the board held that the technical significance of a feature in a claim was not governed by its relevance for the assessment of novelty and inventive step vis-à-vis the available prior art, as had been argued by the appellant, but by its contribution to the technical definition of the claimed subject-matter, to be assessed by the skilled person in the light of the original disclosure. Otherwise, the decision about the technical significance of a feature would be subject to different interpretations dependent on the respectively available prior art. The board also rejected the appellant's argument that the disputed feature was technically meaningless because it was unrelated to the essence of the claimed invention. In this context the board referred to G 2/98 (OJ 2001, 413) where the Enlarged Board had found it problematic to try to distinguish between technical features which were related to the function and effect of an invention and technical features which were not, because there were no clear and objective criteria for making such a distinction, which could thus give rise to arbitrariness. The board came to the conclusion that claim 1 of the main request comprised a technically significant feature which was not disclosed in the application as filed and was therefore not admissible.

In T 1779/09 the board considered that the appellant had found itself exactly in the situation envisaged in decision G 1/93. The board considered that a limiting feature which generally would not be allowable under Art. 123(2) EPC could, under certain conditions, nevertheless be maintained in the claim of an opposed patent in the particular situation addressed in decision G 1/93. It then complied with Art. 123(2) EPC by way of a legal fiction. In the case at issue, the term "only" was introduced during the examination proceedings and successfully objected to under Art. 100(c) EPC in proceedings before the opposition division by the former respondent. Since the board considered the term to be truly limiting, its deletion would extend the protection conferred and thereby infringe Art. 123(3) EPC. However, the board held that the exclusive limitation did not influence the solution of the technical problem as understood from the application as originally filed, and hence provided no technical contribution to the claimed invention (see also T 384/91). It merely excluded protection of part of the invention described in the application, thus not giving any unwarranted advantage to the applicant.

In T 592/99 the board observed that in the case of a product claim concerning a composition defined by its components and their relative amounts given in terms of ranges, it could not be accepted that such ranges, which constituted essential features, did not provide a technical contribution to the subject-matter of the claimed invention, as suggested by the appellant. Any amendment to the ranges had to have the effect of modifying the claimed subject-matter, and thus also provided a technical contribution. If the newly claimed limited range were allowed even though unsupported, any subsequent selection invention based on the new range would have to be refused as not novel, which would otherwise not necessarily be the case. To allow this would, of course, give an unwarranted advantage to the patentee, contrary to the purpose of Art. 123(2) EPC 1973. In the board's view, that was exactly what was meant in the "typical example" given in point 16 of G 1/93, "where the limiting feature is creating an inventive selection not disclosed in the application as filed or otherwise derivable therefrom". Therefore the new feature constituted added subject-matter.

In T 1004/01 the question that arose before the board was whether or not there was a basis in the application as originally filed for a peel strength "of at least 24 grams" to define the claimed laminate. According to the application as filed, the peel strength of the laminate was defined by an open-ended range as an essential feature of the invention. In the general description and the claims there was no further mention of any preferred peel strength range. According to the board, the peel strength of 24 grams could not be detached from the exemplified laminates to form a basis for a generalised lower limit of the claimed peel strength range without taking into consideration the other particulars closely associated therewith. Furthermore, the board pointed out that the general criteria of G 1/93 (OJ 1994, 541) had to be met, namely that the limitation did not involve a technical contribution to the subject-matter of the claimed invention and did not provide an unwarranted advantage. Since the claimed peel strength led to a technical contribution of the claimed subject-matter, the question whether or not the limiting feature created an inventive selection could be left unanswered.

The invention in T 2230/08 concerned a method of regenerating a catalyst/absorber. The undisclosed modification contained in claim 1 as granted and still present in claim 1 of the auxiliary request would be prejudicial to third parties relying on the invention as described in the application as originally filed, as that undisclosed modification which was technically sensible might possibly be the basis for a valuable invention. Claim 1 of the auxiliary request was not restricted to any specific method which would deprive the definition of the temperature of the regenerating gas of all technical contribution within the context of that claim. In the absence of any additional disclosed restricting feature to that effect, the temperature of the incoming regenerating gas was therefore considered to interact with the remaining features of the claim in such terms that it influenced the solution of the technical problem which could be understood from the application as originally filed. It followed that the condition that missing technical contribution be provided, set out in decision G 1/93 (OJ 1994, 541), was not met in the case at issue.

In T 108/12 the formulation "correspondent A maintaining said first signature private to itself" in claim 1 as granted had been replaced by "correspondent A avoiding transmission of said first signature". The board observed that keeping something private, i.e. secret, involved more than merely not transmitting such information. Claim 1 as granted encompassed realisations where signatures were transmitted, but were maintained private. This was no longer required by the amended claim 1. On the other hand, amended claim 1 encompassed signatures which were not transmitted but were nevertheless made public, which was in contrast to claim 1 as granted. Therefore, the features replaced by the amendment did not merely limit the scope of protection of claim 1, but – in contrast to the requirements set out in decision G 1/93 – had a technical effect and contributed to the limitation of the scope of protection of claim 1. Those features could not be deleted from claim 1 without extending the scope of protection of claim 1 and thus infringing Art. 123(3) EPC.

In T 287/14 the board held that the disclaimer "wherein the composition does not contain a beta-nucleating agent" added to the claim was a feature providing a technical contribution to the claimed subject-matter. The disclaimer, by modifying the technical characteristics of the matrix phase of the polyolefin composition of claim 1, gave the

appellant an unwarranted advantage by restricting the claimed subject-matter to a group of polyolefin compositions having specific technical characteristics and properties.

4. Correction of errors in the description, claims and drawings – Rule 139 EPC

According to R. 139 EPC, linguistic errors, errors of transcription and mistakes in any document filed with the EPO may be corrected on request; however, if the request for such correction concerns the description, claims or drawings, the correction must be obvious in the sense that it is immediately evident that nothing else would have been intended than what is offered as the correction. This wording does not differ in substance from the former R. 88 EPC 1973; only some editorial changes have been made in the three languages. Hence, the jurisprudence with regard to R. 88 EPC 1973 is applicable to R. 139 EPC (T 1460/10).

Relevant for the present chapter on amendments is R. 139, second sentence, EPC, which concerns corrections to the parts of a European patent application or of a European patent relating to the disclosure (the description, claims and drawings). Other aspects related to corrections can be found under chapters II.F.4.3. "Correction of errors in a divisional application"; IV.A.5.2.2 "Correction of designation of applicant (Rule 139 EPC)"; IV.A.5.5. "Corrections under Rule 139 EPC"; IV.A.7.3. "Correction of designation of states (Rule 139 EPC)"; IV.B.3.8.2 "Correction of the withdrawal of the application under Rule 139 EPC". As to the corrections under the **first sentence** of R. 139 EPC, the boards of appeal, in particular the Legal Board of Appeal, have developed a large body of case law on corrections, namely that the correction must introduce what was originally intended, the error to be remedied may be an incorrect statement or an omission, and the request for correction must be filed without delay (see G 1/12, point 37 of the Reasons).

4.1. Relationship of Rule 139 EPC with Article 123(2) and (3) EPC

In opinion G 3/89 (OJ 1993, 117) and decision G 11/91 (OJ 1993, 125) the Enlarged Board held that corrections under R. 88, second sentence, EPC 1973 (now R. 139, second sentence, EPC) were special cases of an amendment within the meaning of Art. 123 EPC and fell under the prohibition of extension laid down in Art. 123(2) EPC.

The parts of a European application or patent relating to the disclosure (description, claims and drawings) can be corrected only within the limits of what the skilled person would derive directly and unambiguously, using common knowledge and seen objectively and relative to the date of filing, from the whole of these documents as originally filed. Such a correction was **of a strictly declaratory nature** and thus did not infringe the prohibition of extension under Art. 123(2) EPC 1973.

For case law on these issues prior to G 3/89 and G 11/91, see the summary of facts and submissions of those decisions, and "Case Law of the Boards of Appeal", 7th ed. 2013, II.E.4.1. For a summary of the findings in G 3/89 and G 11/91, see also G 2/95 (OJ 1996, 555, point 2 of the Reasons).

4.2. Obviousness of the error and the correction

In order for a correction in the description, the claims or the drawings to be allowable under R. 139, second sentence, EPC, the boards apply a two-step approach. It must be established (i) that it is obvious that an error is in fact present in the document filed with the EPO, the incorrect information having to be objectively recognisable by the skilled person using common general knowledge (G 3/89, OJ 1993, 117 and G 11/91, OJ 1993, 125, point 5 of the Reasons), and (ii) that the correction of the error is obvious in the sense that it is immediately evident that nothing else would have been intended than what is offered as the correction (G 3/89 and G 11/91, point 6 of the Reasons).

Since the prohibition of extension under Art. 123(2) EPC also applies to a correction under R. 139, second sentence, EPC (G 3/89 and G 11/91, point 1.4 of the Reasons), the parts of a European patent application or of a European patent relating to the disclosure (the description, claims and drawings) may be corrected under R. 139, second sentence, EPC only within the limits of what a skilled person would derive directly and unambiguously, using common general knowledge and seen objectively and relative to the date of filing, from the whole of these documents as filed (G 3/89 and G 11/91, point 3 of the Reasons).

4.2.1 Documents to be taken into account for the assessment of obvious error and correction

Before a correction can be made under R. 139, second sentence, EPC it has to be established what a skilled person would derive, on the date of filing, from the parts of the European patent application relating to the disclosure. As a result of the prohibition of extension under Art. 123(2) EPC, documents other than the description, claims and drawings may only be used insofar as they are used for proving the common general knowledge on the date of filing. On the other hand, documents even if they were filed together with the European patent application, such as priority documents and the abstract may not be used. Documents not belonging to the parts of a European patent application relating to the disclosure could, under certain circumstances, be included partially or wholly in the disclosure by means of reference. Evidence of what constituted common general knowledge on that date could be furnished in any suitable form (G 3/89 and G 11/91).

In T 1008/99 the board held that, for the purposes of R. 88 EPC 1973, the error had to be **apparent from the divisional application itself**, and the parent application could not be used to demonstrate that the error was obvious. Even if it was apparent from the filed description, claims and drawings that they did not belong together, it was not immediately clear from the divisional application itself which of these parts was incorrect.

4.2.2 Obvious error – incorrect information objectively recognisable

In G 3/89 (OJ 1993, 117) and G 11/91 (OJ 1993, 125) the Enlarged Board of Appeal specified that, for a correction under R. 88, second sentence, EPC 1973 to be allowed, the respective part of the European patent application or patent had to contain such an obvious error that a skilled person was in no doubt that the information was not correct and could not be meant to read as such. The skilled person must be in a position

objectively and unambiguously to recognise the incorrect information using common general knowledge. If, on the other hand, it was **doubtful** whether any information at all was incorrect, then a correction was ruled out. The same applies if incorrect information only becomes apparent in the light of the proposed correction.

In T. 664/03 the board held that, even if it considered an interpretation of granted claim 1 in the broader context of the description, it was at least doubtful that the skilled person would come to the conclusion that the feature in question was incorrectly defined in that claim. Therefore, the precondition for correction under R. 88, second sentence, EPC 1973 had not been met.

In T. 829/05 the board held that, even if the skilled person were aware of an inconsistency between the claim and the drawing, he would have no cause to believe that the claim was incorrect. The drawing was stated to be diagrammatic and, in the absence of any evident technical reason to suspect that the claim was incorrect, the skilled person would simply accept the inconsistency as being characteristic of a schematic drawing.

In T. 2230/08 the board considered that the definition of the range of temperature for the incoming stream of regenerating gas in claim 1 did not appear to the skilled person as an error, even less as an obvious one. Furthermore there was no evidence that an error of transcription occurred in the case at issue. Consequently, the request for correction under R. 139 EPC was rejected.

In T. 1436/12 the applicant sought the correction of a reference to a document (a US patent application identified by its docket number) incorporated by reference in the European application. Given that the incorporation by reference of features from a cross-referenced document fell under a different regime before the EPO than before the USPTO, the board deemed it to be conceivable that the incorporation of the reference was meant only for the prosecution before the USPTO and was, therefore, deliberately not amended when the International application was filed at the EPO. Thus the board was not convinced that the reference to a docket number in an application filed at the EPO must generally be considered to have been made in error.

In T. 1702/12 the board held that the skilled person had no reason to doubt the value of 500 when reading granted claim 1 at face value, since this value made technical sense. Even when taking the description and dependent claims of the granted patent into account, the skilled person could not be sure that the value of 500 was erroneous, or whether an error occurred in the description or said dependent claims. The board rejected the argument that any relevant evidence must be taken into account. Rather, if it was necessary to study the prosecution history of the case in order to determine whether an error had been made and what the correction should be, then the criterion of immediacy in R. 139 EPC was not met.

In T. 2523/11 the appellant sought to correct a value of a range in claim 1. The board held that while the range in claim 1 was not necessarily what the appellant wished to pursue, and even if this might indeed have been unintentional, the error itself was not obvious, since the wording of claim 1 was clear and understandable, no inconsistency with regard

to the description existed, the range fell within the range as originally disclosed and it made perfect technical sense. Hence, the skilled person would not have any reason to doubt that it was anything but the limited range which was intended to be pursued.

4.2.3 Obvious correction – immediately evident that nothing else would have been intended than what is offered as the correction

In G 3/89 and G 11/91 the Enlarged Board held that the parts of a European patent application as filed which relate to the disclosure must further allow a skilled person – using the common general knowledge on the date of filing – directly and unequivocally to ascertain the precise content of the information the person making the request actually meant to give, instead of the incorrect particulars, on the date of filing or when making an amendment under Art. 123 EPC, so that, for said skilled person, "it is immediately evident that nothing else would have been intended than what is offered as the correction" (R. 139, second sentence, EPC). However, if there is any doubt that nothing else would have been intended than what is offered as the correction, a correction cannot be made.

Already prior to G 3/89 and G 11/91, the boards had allowed corrections under R. 88, second sentence, EPC 1973 (now R. 139, second sentence, EPC) provided it was immediately evident to the skilled person that an error had occurred and how it should be corrected (see "Case Law of the Boards of Appeal", 7th ed. 2013, II.E.4.2).

In J 5/06 the board, referring to T 158/89 (which had not accepted correction in case of two equally plausible alternatives for a percentage range of a component), held that establishing that a suggested set of documents was a probable and suitable replacement did not amount to establishing that nothing else would have been intended. This latter threshold implied that there was only one **single plausible** replacement – the one which the skilled person would have deduced from those parts of the application which made up the disclosure of the invention. For the case in hand the board concluded that, to the contrary, a complete exchange of the application documents would quite obviously open the door to a plethora of plausible replacements. See also J 16/13, also relating to replacement of application documents; T 15/09 and T 846/16, both relating to correction of a feature in the claims at issue.

In T 955/92 the reasons given by the appellant to show that only the requested correction could have been intended were not based on the level of general knowledge on the date of filing. In order to arrive at the conclusion that the requested correction was the only physically meaningful one, **experiments** had had to be performed which needed more than common general knowledge, and the results thereof would not have been available on the date of filing. The request for correction was therefore refused.

In T 438/99 the board held that the fact that a term or phrase could not be interpreted or construed because it was unresolvably ambiguous did not necessarily mean that its deletion was a permissible amendment under Art. 123(2) EPC 1973. There remained a residual clear meaning in the ambiguous term, e.g., as in this case, that a specific direction was taught, and suppressing that fact resulted in a different technical teaching. Therefore, the second condition of R. 88 EPC 1973 (immediately evident that nothing else would

have been intended than what is offered as the correction) was not met by the offered correction of deleting the feature without replacement.

T.1728/07 concerns the correction of an error in a structural formula representing oxazoline derivatives. The board recalled that according to R.139 EPC, second sentence, it must be immediately apparent to the skilled person that (i) an error has occurred and (ii) how it should be corrected. With respect to requirement (ii), it must be decided whether the corrected feature is directly and unambiguously derivable from the content of the application as originally filed taken as a whole. This requirement was found by the board to be fulfilled.

In T.423/08 there was an obvious mistake in the original wording of one of the claims, in that either "gemäß" (according to) or "vor" (before) was superfluous. Although deleting "gemäß" made sense when considered in isolation, it was incompatible with the wording of claim 1. Deleting "vor" was thus not open to objection under Art.100(c) EPC.

In T.1508/08, the board concluded that the second condition for allowability of a correction under R.139 EPC was not met. In its view, not only did the correction fail to solve the existing problems of a lack of clarity, but it actually made things **even less clear**. That was one reason why the skilled person would not have contemplated the correction made by the appellant proprietor. Even if it were assumed in the appellant's favour that the skilled person would have contemplated this correction, it was not the only one possible, but rather one of at least three conceivable corrections.

In T.455/09 the board held that in the case at issue the skilled person could not exclude one of two options with certainty, so that it was not directly and unambiguously evident that nothing else could have been intended other than the proposed correction. For another case where other corrections were equally possible, see T.923/13.

In T.2303/10 the board held that it would be obvious to the skilled person that the first of the two alternative corrections mentioned by the examining division was totally incompatible with what was disclosed in the application as originally filed, whereas the second was technically feasible and entirely consistent with the disclosure and therefore allowable.

T.163/13 concerned the correction of "72EF" to "72°F". The board held that the only possible correction having a technical meaning in the present context was the temperature, as it was an essential parameter for the test in question. Consequently, the skilled person would immediately consider that "F" meant "Fahrenheit" and make the correction accordingly.

In T.657/11 the board held that the requested correction was obvious. It could not accept the argument of the respondent that the correction was not obvious because the wrong wording of the claim was also to be found in one passage of the description as filed. In fact, apart from this one passage, the rest of the description, the working examples and the figures were in line with the perceived correction. The board also excluded another

possible correction because, although theoretically and technically possible, the skilled person would immediately reject it.

In T 141/14 the board held that the amendment of the feature "vanadium" to "vanadium oxide" did not meet the requirements of R. 139 EPC because the proposed correction was only **one of several options** which would occur to the skilled person. As long as there was at least one further possibility of correction, the criterion within R. 139 EPC that "the correction must be obvious in the sense that nothing else would have been intended than what is offered as the correction" was not fulfilled.

In T 606/90 the board allowed a correction pursuant to R. 88, second sentence, EPC 1973, in the opposition proceedings although the correction was not so obvious from the published text of the patent that it was immediately evident that nothing other than the proposed correction could have been intended. The applicant had filed typed amendments to the claims and the description and had also submitted the "working document" with the handwritten corrections for the dossier. The typed version of claim 1 omitted the detail which was now the subject of a request for correction pursuant to R. 88 EPC 1973; the same detail was present in the corresponding passage in the description. When the text was being prepared for publication of the patent, the detail in question was also omitted from the description owing to an **error by the EPO**. The board concluded that the omission in the description should not be taken into account when considering the admissibility of the correction. The reader of the patent would immediately have noticed the need for correction of the error in claim 1 if a transcription error had not likewise been committed by the EPO.

4.3. Correction of errors in the description, claims and drawings after grant, and in opposition proceedings

In J 42/92 the board had to decide whether a request under R. 88, second sentence, EPC 1973 could be made after grant. It came to the conclusion that a request under R. 88 EPC 1973 for amendments to the description or claims could only be filed **during the pendency of application or opposition proceedings**. Under Art. 97(4) EPC 1973, the decision to grant a European patent took effect on the date on which the European Patent Bulletin mentioned the grant. After this date, R. 88 EPC 1973 could only be applied while opposition proceedings were pending. In the case at issue, the decision to grant the patent had already taken effect, and no opposition had been filed. The appeal was therefore dismissed, since the EPO had ceased to have jurisdiction to consider a request under R. 88 EPC 1973 at the time when the request was filed (see also J 23/03 and T 493/08).

Note that G 1/10 (OJ 2013, 194) deals with the different fields of application of various provisions as compared with R. 140 EPC (formerly R. 89 EPC 1973), in particular R. 139 EPC (points 9 and 11 of the Reasons) and Art. 123 EPC (see point 13 of the Reasons).

In T 657/11 the board observed that according to G 1/10 R. 140 EPC was not available to correct the text of a granted patent and a request for such a correction was inadmissible

whenever made, including after the initiation of opposition proceedings (likewise T 2051/10, T 164/14, T 1578/13). However, in the case at issue, the amendments went beyond the mere removal of an error; namely by limiting the claims to those granted as (process) claims 6-11. Hence the basis for the decision on the appeal (and, thereby, on the opposition) was no longer that for the **decision to grant** the patent-in-suit, which decision would **definitely lose its effect** and be replaced by a new decision. In such a situation any (further) amendment of the claims, even if it aimed at the removal of an obvious mistake in the claims as granted, did not constitute a correction of an error or a mistake in a decision of the EPO within the meaning of R. 140 EPC. The board held that in opposition proceedings mistakes or errors concerning the claims, the description or the drawings of the patent as granted could be removed either by an amendment occasioned by a ground of opposition under Art. 100 EPC (see R. 80 EPC) or, insofar as the mistakes or errors concerned texts or drawings which remained unamended, by way of a correction pursuant to R. 139 EPC (which applied independently of R. 80 EPC; see also T 556/13). See also T 164/14 and T 1578/13, in which, however, the boards ultimately did not decide whether corrections could be made under R. 139 EPC in the conditions set out in T 657/11, because, in any event, the mistakes at issue in those cases were not obvious.

5. Evidence and standard of proof for allowing amendments and corrections

In accordance with the established case law of the boards of appeal, in the case of a proposed amendment under Art. 123(2) EPC or of a correction under R. 139 EPC, the factual disclosure of a European patent application as originally filed has to be established to a rigorous standard, namely the standard of certainty "beyond reasonable doubt". In T 1248/08 the board recalled this case law, in particular as established in T 113/86, T 383/88, T 581/91, T 723/02 and T 1239/03; for recent decisions confirming this standard, see e.g. T 831/11, T 1710/13, T 2418/13, T 1224/14. According to T 307/05 and T 370/10, the same standard of "beyond reasonable doubt" applies when assessing the allowability of amendments under Art. 123(3) EPC. The burden of proof that amendments comply with Art. 123(2) EPC rests with the party making the amendment (T 910/06 with reference to T 1239/03; see also T 222/05 and T 1497/08).

In T 383/88 the board held that the normal standard of proof in proceedings before the boards, namely "the balance of probability", was inappropriate for determining the allowability of an amendment under Art. 123(2) EPC 1973. Instead, a rigorous standard, i.e. one equivalent to "beyond reasonable doubt" was considered by the board to be the right one to apply in such a case, since applying a lower standard could easily lead to undetected abuse by allowing amendments on the basis of ostensibly proven common general knowledge. T 383/88 also considered that the issue of the allowability of an amendment under Art. 123(2) EPC 1973 had to be decided by reference to what could be derived from the patent application as filed in the light of common general knowledge and not vice versa. Moreover, it was notoriously difficult to prove common general knowledge. For example, information might be generally disseminated, and therefore known within the community of skilled addressees, but it might well, at the same time, not be commonly accepted. The board added that it could not normally be the case that an affidavit by a single person was sufficient to discharge the burden of proof to the strict standard that was required (see also T 1046/96).

In T.795/92 the board stated that Art. 123(2) EPC 1973 clearly precluded allowing an amendment if there was any doubt as to whether or not it was derivable from the original application. In the case at issue, in spite of a certain probability in favour of the appellant's (patentee's) position, the amendment was not allowable because there were various known methods for calculating the value in question, not all leading to identical results, and the application did not directly and unambiguously disclose which method had to be used.

The board in T.307/05 stated that, as indicated in the decision T.64/03, it was established case law that a **very rigorous standard**, namely that of "beyond reasonable doubt", was to be applied when checking the allowability of amendments under Art. 123(2) and 123(3) EPC. A similar rigorous standard was also expressed in the decision T.581/91 relied on by the board in its communication by reference to the decision T.113/86, in which it was stated that the **slightest doubt** that the unamended patent could be construed differently to the patent as amended would preclude the allowability of the amendment (see also T.370/10, T.2285/09, T.2418/13). While it was true that, as argued by the appellant, decision T.113/86 referred to voluntary amendments requested by the patentee and not necessitated by any ground of opposition, the fact that the amendment would be, as in the present case, necessitated by a ground of opposition (i.e. Art. 100(c) EPC) could not, in the board's view, justify the application of a lower standard of proof than the one mentioned in that decision. On the contrary, a very rigorous standard was even more justified in the case in question, since allowing such amendments while using a lower standard of proof might give an unwarranted advantage to the patentee in the overcoming of a ground of opposition.

In T.1248/08, in the application as filed, a number pertaining to a value used in example 1 was illegible and indecipherable. It was not clear whether it should read "0.08" or "0.09", or even "0.05". The board was not persuaded by the appellant's arguments that the actual disclosure of that figure was unequivocal and that it read "0.09". The board held that the arguments of the appellant adopting proof "on the balance of probability", in particular a **survey**, had to fail. According to this survey – conducted amongst partners and staff at the firm of the appellant's representative – a total of 67 out of 72 test persons had indicated the relevant entry in Table 1 to be "0.09" without qualification. However, it was also found that two respondents had indicated another figure ("0.08") and that three further respondents who indicated "0.09" had also considered other possibilities. In the board's opinion, therefore, these results demonstrated that the value in question could not be considered to be "0.09" with a certainty "beyond reasonable doubt".

In any event, a question of accuracy and disclosure could not be decided by a poll. With reference to G.11/91, the board also decided that the disclosure of the priority document could not be used to dispel doubts as to the meaning of an ambiguous part of the application. The same applied to the family documents, for the reason that the text of another patent application based on the same priority document did not need to be identical to the European patent application.

F. Divisional applications

1.	Introduction	539
2.	Subject-matter of a divisional application	540
2.1.	Subject-matter extending beyond content of the earlier application	540
2.1.1.	Directly and unambiguously derivable from content of earlier application as filed	541
2.1.2.	Sequence of divisionals – derivable from each of the preceding applications as filed	541
2.1.3.	Language issues	542
2.2.	Amendments to divisional applications	542
2.3.	Subject-matter of a patent granted on a divisional application	543
2.3.1.	Findings of G 1/05 and G 1/06 also applicable to granted patents	543
2.3.2.	Ground for opposition under Article 100(c) EPC	543
2.4.	Link between subject-matter of earlier application and divisional application	544
2.4.1.	No abandonment of subject-matter in earlier application if divisional is filed	544
2.4.2.	No effect on content of divisional application if earlier application has lapsed	544
2.4.3.	Final decision on subject-matter in the parent application – res judicata	544
	a) Decisions affirming cross-procedural res judicata effect	544
	b) Decisions leaving open the question of cross-procedural res judicata effect	545
	c) Decisions doubting cross-procedural res judicata effect	545
2.4.4.	Re-filing of same subject-matter	545
3.	Filing a divisional application	546
3.1.	Right to file a divisional application	546
3.1.1.	Applicant of earlier application entitled to file divisional application	546
3.1.2.	Filing of divisional application during stay of proceedings	546
3.1.3.	Joint applicants	547
3.1.4.	No obligation to postpone a decision to allow the filing of a divisional application	547
3.2.	Filing date attributed to divisional application	547
3.3.	Language for filing divisional application	548
3.4.	Divisional application to be filed with EPO	548
3.5.	Requirement of pending earlier application	548
3.5.1.	Requirement of pending earlier application sets no time limit	549
3.5.2.	Pendency before the EPO	549
3.5.3.	Pendency in case of grant of earlier application	549
3.5.4.	Pendency in case of refusal of earlier application against which no appeal was filed	550
3.5.5.	Pendency in case of refusal of earlier application against which an appeal was filed	550
3.5.6.	Pendency in case of deemed withdrawal of earlier application and request for re-establishment	551
3.5.7.	Pendency in case of deemed withdrawal of earlier application and no reaction to loss of rights communication under Rule 112(1) EPC	551

3.5.8	Pendency in case of withdrawal of earlier application	552
3.6	Time limits under Rule 36(1)(a) and (b) EPC in the version in force between 1 April 2010 and 31 March 2014	552
3.6.1	Changes to Implementing Regulations	552
3.6.2	Interpretation of Rule 36(1)(a) and (b) EPC	553
4	Procedural questions	553
4.1	Procedural independence of divisional application	553
4.2	Designation of contracting states in a divisional application	554
4.2.1	Deemed designation of all states designated in earlier application at the date of filing of divisional	554
4.2.2	Payment of fee for each designated State – case law concerning situation prior to 1 April 2009	555
4.3	Correction of errors in a divisional application	556
4.4	Search fee for a divisional application	556
5	Double patenting	556
5.1	No legitimate interest in grant of a second patent claiming same subject-matter	558
5.2	Different subject-matter and scope of protection; overlapping subject-matter	558
5.3	Double patenting objection in opposition	561

1. Introduction

A divisional application is a new application which is separate and independent from the earlier application. Therefore, divisional applications are to be treated in the same manner as ordinary applications and are subject to the same requirements, unless specific provisions of the EPC require something different (see G 1/05, OJ 2008, 271). The most important provisions on European divisional applications are Art. 76 EPC and R. 36 EPC (R. 25 EPC 1973).

According to Art. 76(1), second sentence, EPC, the divisional application may be filed only in respect of subject-matter which does not extend beyond the content of the earlier application as filed. The divisional application is accorded the same filing date as the parent (earlier) application and benefits from any right of priority of the parent (earlier) application in respect of the subject-matter contained in the divisional application. When determining whether the subject matter of a divisional application extends beyond the content of the earlier application as filed (Art. 76(1), second sentence, EPC) exactly the same principles are to be applied as for extension of subject-matter under Art. 123(2) EPC (G 1/05; see in this chapter II.F.2.1.).

Divisional applications may be amended like any other application. If a divisional application is amended, it must meet the requirements of both Art. 76(1) EPC and Art. 123(2) EPC, so as to preclude the introduction of new subject-matter into the proceedings (see in this chapter II.F.2.2.).

A divisional application (of whatever generation) can be the "earlier application" within the meaning of Art. 76(1) EPC for a further divisional (G 1/06, OJ 2008, 307). According to R. 36(1) EPC the earlier application must still be pending (see in this chapter II.F.3.5.).

It is a ground of opposition and a ground of revocation if the subject-matter of a patent granted on a divisional application extends beyond the content of the earlier application as filed, see Art. 100(c), 138(1)(c) EPC.

The question whether a European divisional application may anticipate its parent ("poisonous divisional") is treated in the context of partial priority in T 557/13 (OJ 2016, A87; referral G 1/15). For a summary of G 1/15 (OJ 2017, A82), see in chapter II.D.5.3. "Multiple priorities or partial priority for one claim".

2. Subject-matter of a divisional application

2.1. Subject-matter extending beyond content of the earlier application

The wording of Art. 76(1) EPC and the wording of Art. 123(2) EPC is so similar (in all three languages) that it is clear that **exactly the same principles** are to be applied for both types of cases when determining what extends beyond the content of the earlier application (G 1/05, OJ 2008, 271). The mere fact that the wording of the French version differs (Art. 76(1), second sentence, EPC: "éléments"; Art. 123(2) EPC: "objet") does not justify a different interpretation (T 276/97). The case law on added subject-matter is summarised in chapter II.E.1.

Art. 76(1) and Art. 123(2) EPC have the **same purpose**, i.e. to create a fair balance between the interests of applicants and patentees, on the one hand, and competitors and other third parties on the other. The idea underlying these provisions is that an applicant should not be allowed to improve his position by adding subject-matter not disclosed in the application as filed, which would give him an unwarranted advantage and could be damaging to the legal security of third parties relying on the content of the original application (G 1/93, OJ 1994, 541; T 873/94, OJ 1997, 456; T 276/97, T 701/97). Both Art. 76(1) EPC 1973 and Art. 123(2) EPC 1973 enshrine the principle that before grant the legal security of third parties is sufficiently protected by the prohibition of extending the content of the application by amendment beyond what was originally disclosed (T 1387/05).

Since the underlying requirements of Art. 123(2) and 76(1) EPC are the same, there is no harm done if the examining division incorrectly refers to Art. 123(2) EPC (instead of Art. 76(1) EPC) when refusing a divisional application on the grounds that its subject-matter extended beyond the parent application (T 542/94).

In T 441/92 the board considered that there was nothing in the EPC to prevent an applicant from repeating the earlier description in a divisional application and that Art. 76(1) EPC 1973 had not been contravened in this respect in the case in point.

2.1.1 Directly and unambiguously derivable from content of earlier application as filed

The subject-matter of a divisional application must be **directly and unambiguously derivable** from the earlier application as filed (see G 1/06, OJ 2008, 307). More specifically, subject-matter of the divisional must be directly and unambiguously derivable by the skilled person from the disclosure of the earlier application as filed, as determined by the totality of its claims, description and figures when read in context (see consolidated cases T 1500/07, T 1501/07, T 1502/07; see also T 961/09).

Subject-matter claimed in the divisional application has to be compared with the content of the earlier (parent) application as filed, whereby the content of an application comprises the whole disclosure, express or implied, that is directly and unambiguously derivable from the application including information which is implicit and immediately and unambiguously apparent to a person skilled in the art reading the application (T 423/03). In other words, it has to be established whether technical information has been introduced into the divisional application which a skilled person would not have objectively and unambiguously derived from the earlier application as filed (T 402/00).

The "content" within the meaning of Art. 76 EPC is to be interpreted as the **whole technical content** of the earlier application (G 1/05, OJ 2008, 271, point 9.2 of the Reasons). Art. 76 EPC does not require that the content be disclosed in the claims of the earlier application. It only requires that the subject-matter be disclosed as such anywhere in the whole disclosure of the earlier application (T 211/95, T 1026/03, T 314/06).

2.1.2 Sequence of divisionals – derivable from each of the preceding applications as filed

In G 1/06 (OJ 2008, 307) the Enlarged Board ruled that Art. 76 EPC 1973 also applied to divisionals from divisionals, because – if not specifically provided otherwise – divisionals must be treated just like any other application. Therefore a divisional (of whatever generation) could be the "earlier application" within the meaning of Art. 76(1) EPC 1973 for a further divisional. In the case of a sequence of applications consisting of a root (originating) application followed by divisional applications, each divided from its predecessor, it was a necessary and sufficient condition for a divisional application of that sequence to comply with Art. 76(1), second sentence, EPC 1973 that anything disclosed in that divisional application be directly and unambiguously derivable from what is disclosed in **each of the preceding applications as filed** (see G 1/06).

The subject matter has to be still present (i.e. it was not unequivocally and definitively abandoned by that time, see J 2/01, OJ 2005, 88; J 15/85, OJ 1986, 395) in each earlier predecessor application at the time the – further – divisional application was filed so that it was thereby existing at all times throughout after its disclosure in the root application as filed up to and including the date of filing the divisional application under consideration. Content which had been omitted on filing a member higher up the sequence could not be re-introduced into that member or in divisional applications lower down the sequence from it. Conversely, content which has been added on filing of a divisional application a sequence higher up could not be claimed in a divisional application down the sequence

because according to Art. 76(1) EPC such added matter did not benefit from the filing date of the root application in which it was not disclosed (see G 1/06).

In T 2175/09 the appellant argued that an infringement of Art. 76(1) EPC 1973 in the case of an intermediate higher-generation divisional application (here the grandparent application) did not constitute a ground for opposition under Art. 100(c) EPC 1973. The board held that Art. 100(c) EPC 1973 gave the public the possibility of opposing a patent on the ground that its subject-matter extended beyond the content of the earlier application as filed if an infringement of Art. 76(1) EPC 1973 had been overlooked in examination proceedings. This also applied in the particular case of an infringement of Art. 76(1) EPC 1973 in an intermediate higher-generation divisional application. The grandparent application too is "the earlier application" within the meaning of Art. 100(c) EPC.

2.1.3 Language issues

In T 1076/12 the board held that it was the text of the application as originally filed, even if the text was not in an official language of the EPO, that had to be used, together with any other non-text portions of the application as filed, in order to determine the "content of the earlier application as filed" as referred to in Art. 76(1) EPC.

2.2. Amendments to divisional applications

Divisional applications are new applications which are separate and independent from the earlier applications. Amendments to a divisional application are thus allowed under Art. 123(2) EPC to the **same extent as amendments of any other non-divisional application** (G 1/05, OJ 2008, 271).

Amendments may be allowed even if the divisional application as filed contains – contrary to Art. 76(1), second sentence, first half sentence, EPC – subject-matter extending beyond the earlier application as filed. Such a divisional application is **not** to be considered "invalid" (G 1/05, OJ 2008, 271). It may still be amended during examination proceedings so that it complies with the requirements of Art. 76(1) EPC, provided always, however, that the amendment complies with the other requirements of the EPC (see G 1/05, OJ 2008, 271). Even if the **earlier application is no longer pending**, it remains possible to amend a divisional application to bring it in line with the requirements of Art. 76(1) EPC (G 1/05, OJ 2008, 271).

If a divisional application is amended, it must meet **both the requirements of Art. 76(1) EPC and those of Art. 123(2) EPC**, so as to preclude the introduction of new subject-matter into the examination proceedings (see, among many others, T 284/85; T 441/92; T 873/94, OJ 1997, 456; T 1221/97; T 1008/99; T 561/00; T 402/00; T 423/03).

2.3. Subject-matter of a patent granted on a divisional application

2.3.1 Findings of G 1/05 and G 1/06 also applicable to granted patents

The findings of the Enlarged Board of Appeal in G 1/05 (OJ 2008, 271) and G 1/06 (OJ 2008, 307), although made in regard to patent applications, are also valid for granted patents. This can be derived from the fact that the Enlarged Board of Appeal relied on a direct correspondence between Art. 76(1) and 123(2) EPC, both articles enshrining the same principles, and that Art. 123(2) EPC applied to both patent applications and patents (T 265/05). Thus, in order to meet the requirements of Art. 100(c) EPC 1973, it was a necessary and sufficient condition that anything disclosed in the granted patent had to be directly and unambiguously derivable not only from the application on which the patent had been granted, but also from what was disclosed in each of the preceding applications as filed (T 687/05, T 549/09, T 2175/09).

2.3.2 Ground for opposition under Article 100(c) EPC

In T 475/02 the board had to decide whether the patent application fulfilled the requirements of Art. 100(c) EPC. Since the opposed patent was granted on a divisional application, for the subject-matter of any claim as granted to be allowable, it had to pass both of the **two tests** of this provision: (i) the subject-matter must not extend beyond the content of the divisional application as filed; and, (ii) it must not extend beyond the content of the earlier application as filed. Whether the first test was passed depended only on the particular claim and on the content of the divisional application as filed. That the subject-matter of a claim passed the second test did not necessarily mean that it passed the first, and vice-versa. The two tests needed separate consideration, in particular where the divisional application as filed did not include the complete text (both description and claims) of the parent application.

In T 806/03 the opposition division had applied the first test of Art. 100(c) EPC to "the application as originally filed, which is the parent application" and decided that Art. 123(2) EPC had not been complied with. The board stated that the first test under Art. 100(c) EPC was governed by Art. 123(2) EPC, and the second by Art. 76(1) EPC. The board held that the wrong reference made no difference with regard to the substance of the opposition division's decision, since the descriptions of the parent application and of the divisional application as filed were identical.

In T 2233/09 the board held that Art. 100(c) EPC contained two distinct legal grounds: Art. 76(1) EPC and Art. 123(2) EPC. Since no objections with respect to Art. 76(1) EPC had been raised during the opposition proceedings, such a new legal ground could be introduced in the appeal proceedings only with the consent of the patent proprietor.

In T 1975/09 the board held that Art. 100(c) EPC – and not Art. 76(1) EPC – would have been the correct provision to cite in the decision of the opposition division when the claims of the granted patent were considered. With respect to amendments made to the claims in the course of the opposition proceedings, Art. 101(3)(a) and (b) EPC required the opposition division to form an opinion on whether or not the patent and the invention to

which it related met the requirements of the Convention. Art. 76(1) EPC related to a requirement for filing a divisional application, which was not a requirement under the Convention for an (amended) patent. Therefore, the requirement of Art. 123(2) EPC, although not explicitly referring to the content of the "earlier application(s)", was the corresponding requirement of the Convention within the meaning of Art. 101(3) EPC, to be met by the patent in relation to amendments made thereto, with respect to the content of the earlier and of the divisional application(s) as filed.

2.4. Link between subject-matter of earlier application and divisional application

2.4.1 No abandonment of subject-matter in earlier application if divisional is filed

In T. 118/91 the respondent argued that since a divisional application was filed, the subject-matter of the divisional must be considered to have been abandoned in the parent application. The board held that there was nothing in Art. 76 EPC 1973 or any other provision of the EPC to support that contention: the content of the application as filed cannot, as a matter of logic, be reduced by the subsequent filing of a divisional application.

2.4.2 No effect on content of divisional application if earlier application has lapsed

In T. 441/92 the parent application was refused by a decision of the examining division (which became final after the appeal was held inadmissible) after the divisional application had been filed. The board held that the lapse of the parent application cannot have the effect of reducing the content of a previously filed divisional application.

2.4.3 Final decision on subject-matter in the parent application – res judicata

a) Decisions affirming cross-procedural res judicata effect

In T. 51/08 the appellant submitted amended claims corresponding to the second auxiliary request of the parent application which had already been refused on appeal. The board held that subject-matter on which a final decision had been taken by a board of appeal in the parent application became res judicata and could not be pursued in the divisional application (see also T. 790/10, see however also T. 2145/11, in which the board distinguishes its case from T. 51/08 as the claims at issue were not identical to those in the proceedings related to the parent patent).

In T. 1155/13 an objection of lack of sufficiency was raised by the appellant against the patent based on a divisional application. The board considered, however, that T. 468/09 had dealt with an insufficiency objection in relation to the patent granted on the basis of the parent application. Since decision T. 468/09 was res judicata and dealt with insufficiency of disclosure in relation to the same embodiments, and the facts were the same, the current board had no power to examine this objection again (with reference to T. 51/08).

b) Decisions leaving open the question of cross-procedural res judicata effect

In T.1643/10 the board left open the question of whether, or to what extent, decisions regarding a parent or a sibling application represent res judicata for a divisional application. For the board in T.1666/14 too, there was ultimately no need to answer this question because the claims at issue in the examination appeal proceedings brought before it in relation to the divisional application differed from those decided on in the earlier opposition appeal proceedings concerning the parent application. It nevertheless took the view that, where decisions had been taken on a parent application in both examination appeal and opposition appeal proceedings, only the latter decision could, if at all, have binding effect on the relation between the parent and divisional application. See also T.2145/11, in which the board similarly held there could be no res judicata because the claims were not identical.

c) Decisions doubting cross-procedural res judicata effect

In T.2084/11 the appellant (opponent) had argued that the invention's reproducibility was res judicata, a final decision having already been taken on the parent application. The board noted that the EPC did not mention res judicata, let alone regulate its applicability in the context of separate proceedings on parent and divisional applications or any resulting patents. EPO proceedings on a divisional were essentially independent of those on its parent (see T.1254/06). The board therefore doubted that a final decision taken in opposition appeal proceedings (here revocation of the patent) could have any "cross-procedural" res judicata effect at all on separate opposition (or opposition appeal) proceedings concerning a patent granted on a divisional. T.167/93 had already said that res judicata, whilst a generally recognised principle, was of extremely narrow scope and would only "involve something" where (amongst other criteria) "the issues of fact are the same". But it had said nothing about any "cross-procedural" application. In the case in point, the board anyway took the view that the above criterion from T.167/93 was clearly not fulfilled, because the subject-matter (the "something" in the sense of T.167/93) requiring the division's or board's decision was not the patent granted for the parent application; rather, it was the divisional-derived patent and whether the requests submitted were legally sustainable in view of the objections raised, and – in contrast to T.51/08 – the requests (sets of claims) for decision in the two sets of proceedings were also not identical. Moreover, the underlying facts were different since further evidence had been submitted. The board's conclusion was that in the case in hand the appeal decision on the parent patent could have no res judicata effect in the opposition (or opposition appeal) proceedings as regards the reproducibility of the divisional-derived patent in suit.

2.4.4 Re-filing of same subject-matter

In T.1287/07 the appellant had submitted before the board that re-filing the same subject-matter comprised in an earlier divisional application which had been withdrawn and converted into a national right was an abuse of procedure. The board clarified that this re-filing did not fall within the grounds for opposition exhaustively listed in Art. 100 EPC, and there was no legal basis for revoking the patent in suit on this basis. Therefore, the alleged re-filing of the same subject-matter could not result in the revocation of the patent in suit.

In T 1437/10 the appellant filed new requests during oral proceedings which claimed subject-matter essentially identical to the scope of protection of the granted European patent for which the appellant was the proprietor and for which the application at issue was the earlier application in accordance with Art. 76(1) EPC. Consequently, the subject-matter of the new requests had already been decided in favour of the appellant and a second decision on the same subject-matter was superfluous. The board therefore exercised its discretion under Art. 13(1) RPBA so as not to admit the new requests into the procedure.

On the related issue of "double patenting" see in this chapter II.F.5. below.

3. Filing a divisional application

3.1. Right to file a divisional application

3.1.1 Applicant of earlier application entitled to file divisional application

In J 20/05 the Legal Board held that only the applicant of the earlier (parent) application was entitled to file the divisional application. It stated that, fundamentally, it is the entitlement acquired by virtue of the parent application that gives the right to file a divisional application. This means that the rights in respect of the divisional application derivable from the parent application extend to, but are also limited to, the rights existing in the parent application at the filing date of the divisional application. The entitlement to file a divisional application under Art. 76 and R. 25 EPC 1973 (now R. 36 EPC) was a procedural right that derived from the applicant's status as applicant in the earlier application (with reference to J 2/01).

In J 34/86 the Legal Board allowed an application to be filed as a divisional application by a party other than the registered applicant for the parent application. This case concerned, however, a particular set of circumstances. The applicant for the parent application had been ordered by a US court to assign all property rights in the invention to the person who became the applicant for the divisional application, and the applicant for the parent application had already signed an assignment to that effect.

3.1.2 Filing of divisional application during stay of proceedings

In J 20/05 application proceedings had been suspended under R. 13 EPC 1973 (now R. 14 EPC) because of pending national entitlement proceedings. The Legal Board decided that the applicant was not entitled to file a divisional application relating to that application while the proceedings remained suspended (confirmed in G 1/09, OJ 2011, 336).

In J 9/12 the Legal Board added that to allow the filing of a divisional application by an applicant whose entitlement was challenged would be inconsistent with and contrary to the fundamental objective of R. 14(1) EPC, which was to preserve any potential rights a third party might have to the grant of a patent for the earlier application in dispute.

3.1.3 Joint applicants

In J 2/01 (OJ 2005, 88) the Legal Board held that joint applicants could not acquire a procedural status different from that of a single applicant, because otherwise each of them could perform different and contradictory procedural acts, including the filing of different versions of the patent to be granted. Therefore, where an application (the "earlier application") had been filed jointly by two or more applicants and the requirements of Art. 61 or R. 20(3) EPC 1973 (now R. 22 (3) EPC) had not been met, the right to file a divisional application in respect of the earlier applications under Art. 76 EPC 1973 was only available to the registered applicants for the earlier application jointly and not to one of them alone or to fewer than all of them.

3.1.4 No obligation to postpone a decision to allow the filing of a divisional application

In T 1184/03 the appellant requested during the oral proceedings before the board that the delivery of the decision be postponed with a view to filing a divisional application. Since the case was ready to be decided at the oral proceedings, the board held that postponing the decision of the board to allow the filing of a divisional application would run counter to the public interest in having the matter decided as expeditiously as possible, because the matter ready to be finally decided by this board would be pending again. See also T 592/15.

In T 591/05 the applicant had declared during the examination proceedings that he reserved the right to file a divisional application. The board found that this declaration created no obligation for the examining division to check the status of any possible divisional application or to postpone the grant of the patent. It was incumbent on the applicant, and not on the EPO, to undertake the appropriate measures to ensure that any possible divisional application was filed in due time before the grant procedure was closed.

3.2. Filing date attributed to divisional application

According to Art. 76(1), second sentence, EPC, in so far as the subject matter of the divisional application does not extend beyond the content of the earlier application as filed, the divisional application shall be deemed to have been filed on the date of filing of the earlier application.

The characterising feature of a sequence of divisional applications each divided out from its predecessor is that each member of the sequence claims as filing date the date of the originating or root application in which the subject-matter divided out in sequences of divisional applications was first disclosed. The filing date of the root application is the **only filing date** which can be attributed to a divisional application, by way of the legal fiction contained in Art. 76(1), second sentence, second half sentence, EPC 1973, irrespective of whether the divisional application is a first divisional or a divisional further down in a sequence of divisionals (G 1/06).

In T 600/08 the Receiving Section had granted the request that the applicant's name in the divisional application be corrected (under R. 88 EPC 1973) on the ground that the

wrong firm had been named as applicant by mistake. Before the board, the appellant (opponent) asserted that the request for correction under R. 88 EPC 1973 ought not to have been granted and that the divisional application was therefore invalid. As a result, the filing date relevant for the patent at issue was the date of receipt of the application on which it was based. The board found that there were only two alternatives for a European patent application filed as a divisional application: either it was not treated as a divisional application, in which case the grant procedure would not even start, or it was treated as a divisional application, in which case it could only be accorded the filing date of its parent application. Since the application on which the patent was based had been filed as a divisional application and then treated as such, there was no choice but to accord it the filing date of the parent application. The EPC does not provide for reviewing in opposition proceedings whether the correction of an applicant's name carried out by the Receiving Section was lawful (Art. 100 EPC 1973).

3.3. Language for filing divisional application

According to R. 36(2), first sentence, EPC, a divisional application shall be filed in the language of the proceedings of the earlier application. According to R. 36(2), second sentence, EPC, if the latter was not in an official language of the European Patent Office, the divisional application may be filed in the language of the earlier application; in such a case, a translation into the language of the proceedings for the earlier application shall be filed within two months of the filing of the divisional application.

In J. 13/14 the Legal Board observed that a divisional application of an earlier application, which was filed in an EPO official language, had also to be filed in the EPO official language of the earlier application. Otherwise, it would have been filed in an inadmissible language. A correction of the language deficiency by means of a translation into the language of the proceedings for the earlier application was neither required under R. 36(2), second sentence, EPC nor was it even admissible in view of the wording of that provision and of G 4/08 (OJ 2010, 572). A correction under R. 139, first sentence, EPC or Art. 123(2) EPC was also not possible. The legal consequence of the non-compliance with the language requirements was that the divisional application could not be treated as a valid divisional application by analogous application of Art. 90(2) EPC.

3.4. Divisional application to be filed with EPO

Divisional applications must be filed with the EPO in Munich, The Hague or Berlin (R. 36(2), third sentence, EPC). If a divisional application is sent to a national authority, the latter does not have to transmit it to the EPO. However, if it does, this application will have as date of receipt the date on which it reaches the EPO (T. 196/10).

3.5. Requirement of pending earlier application

R. 36 EPC (former R. 25 EPC 1973) requires that a divisional application only be filed if it is in relation to any **pending** earlier patent application. In G 1/09 (OJ 2011, 336) the Enlarged Board of Appeal decided that a "pending (earlier) European patent application" in the specific context of R. 25 EPC 1973 (R. 36(1) EPC) was a patent application in a

status in which substantive rights deriving therefrom under the EPC were (still) in existence.

Note however that a divisional application cannot be validly filed during proceedings that have been stayed, see in this chapter [II.F.3.1.2](#).

3.5.1 Requirement of pending earlier application sets no time limit

The wording "to any pending earlier European patent application" in [R. 36\(1\) EPC](#) does **not set a period/time limit**, but rather sets a condition ([J 29/10](#), referring to [J 10/01](#); [J 24/03](#), OJ 2004, 544; [J 18/04](#), OJ 2006, 560; [J 7/05](#), [G 1/09](#), OJ 2011, 336, [J 10/12](#)). Therefore, the provision on the re-establishment of rights does not apply to the filing of a divisional application ([J 24/03](#), see also [J 21/96](#) and [J 10/01](#)). [R. 134\(2\) EPC](#), concerning the effects on periods of a general dislocation in the delivery of mail, does also not apply ([J 29/10](#)).

In [J 18/04](#) (OJ 2006, 560) the board held that the term "pending ... patent application" in [R. 25\(1\) EPC 1973](#) did not set a time limit, but rather established a **substantive requirement** which had to be fulfilled at the point when a divisional application was filed. A board had no power to exempt an applicant from compliance with this substantive requirement. No substantive rights were established in a divisional application before the actual filing date of the divisional application. Substantive rights which were lost in the parent application could not be re-established in the divisional application by applying [Art. 122 EPC 1973](#).

3.5.2 Pendency before the EPO

In [J 18/09](#) (OJ 2011, 480) the Legal Board of Appeal decided that an international application which did not fulfil the requirements according to [Art. 22 PCT](#) for entering the European phase was not pending before the European Patent Office and therefore could not be considered a pending earlier European patent application pursuant to [R. 36\(1\) EPC](#). The term "pending earlier European patent application" under [R. 36\(1\) EPC](#) included the requirement that the application must be pending before the European Patent Office acting as patent-granting authority according to the EPC. On the basis of the provisions of the PCT and the EPC, a **Euro-PCT application** not having entered the European phase was not a pending earlier European application within the meaning of [R. 36\(1\) EPC](#). See also [G 1/09](#), point 3.2.5 of the Reasons.

3.5.3 Pendency in case of grant of earlier application

An application is pending up to (but not including, see [J 7/04](#), [J 24/10](#)) the date on which the European Patent Bulletin mentions the grant of the European patent or up to the date on which the application is refused, withdrawn or deemed withdrawn ([J 28/03](#); for the situations of refusal and (deemed) withdrawal of the earlier application, see in this chapter [II.F.3.5.5](#) to [3.5.8](#)). By way of an obiter dictum, the Enlarged Board of Appeal held in [G 1/09](#) (OJ 2011, 336) that, in the case of a decision to grant, the pending status of the European patent application normally ceased on the **day before the mention of its grant was**

published since from that point in time **substantive rights** under the EPC were no longer derived from the patent application, but now derived from the granted patent.

3.5.4 Pendency in case of refusal of earlier application against which no appeal was filed

In G 1/09 (OJ 2011, 336) the Enlarged Board of Appeal decided that, in the case where no appeal is filed, a European patent application which has been refused by a decision of the examining division is thereafter pending within the meaning of R. 25 EPC 1973 (R. 36(1) EPC) until the **expiry of the time limit for filing a notice of appeal**. It stated that a "pending (earlier) European patent application" in the specific context of R. 25 EPC 1973 (R. 36(1) EPC) was a patent application in a status in which substantive rights deriving therefrom under the EPC were (still) in existence. A patent application which had been refused by the examining division was thereafter still pending within the meaning of R. 25 EPC 1973 (R. 36(1) EPC) until the expiry of the period for filing an appeal and, on the day after, was no longer pending if no appeal was filed.

3.5.5 Pendency in case of refusal of earlier application against which an appeal was filed

In J 5/08 the Legal Board had to decide whether the parent application was pending at the date of filing of the divisional application which took place after the appeal in the parent application had been filed but before the **interlocutory revision decision** by which the examining division revised the appealed decision (decision to grant referring to uncorrected text of claim 1). This revision decision was restricted to the correction of the decision to grant without any exhaustive statement in respect of the patentability of the subject matter. According to the Legal Board, a revision decision pursuant to Art. 109 EPC 1973 as such opened up the possibility that the patentability of the claimed subject matter would be completely re-assessed. In the case at issue, the grant proceedings which had been terminated by the revision decision were still pending up to that date of the revision decision. The Legal Board concluded that in general where a decision is taken on the **allowability of an appeal**, an application was pending within the meaning of R. 25 EPC 1973 (now R. 36(1) EPC) at least up to the point in time when the decision was taken.

The Legal Board in J 5/08 noted that there appeared to be diverging case law on the question of whether the suspensive effect of an appeal always had the consequence that the grant proceedings remained pending within the meaning of R. 25 EPC 1973 (R. 36(1) EPC) during the appeal proceedings. One line of decisions appeared to say that this was indeed the case (J 28/94, OJ 1995, 742 and J 3/04). However, a different view was taken in J 28/03, where the Legal Board had decided that the grant proceedings were to be considered as not having been pending during the appeal proceedings if the appeal was dismissed as **inadmissible**; the status of a divisional application filed while an appeal against the decision to grant a patent on the parent application was pending **depended on the outcome of that appeal**.

In J 23/13 the applicant had filed the divisional application after the filing of the notice of appeal against the decision refusing the parent application, but before the **time limit for filing the statement of grounds of appeal** had expired; since no statement of grounds

was filed, the board rejected the appeal against the refusal of the parent application as **inadmissible**. The board in **J 23/13** observed that the divisional application had been filed while the time limit for filing the grounds of appeal was still running. The fact that the appeal was later rejected as inadmissible could not change the fact that, on the date when the divisional was filed, substantive rights were still in existence (**G 1/09**, OJ 2011, 336).

In **J 22/13** the applicant had filed the divisional application, in contrast to the situation in **J 23/13**, **after expiry of the time limit for filing the statement of grounds of appeal**. The application could thus not be treated as a divisional application.

3.5.6 Pendency in case of deemed withdrawal of earlier application and request for re-establishment

In **J 4/11** (OJ 2012, 516) the Legal Board held that an application which had been deemed to be withdrawn for **non-payment of a renewal fee** was not pending within the meaning of **R. 25(1) EPC 1973** in the period for filing a request for re-establishment of rights under **Art. 122 EPC 1973** in respect of such non-payment, or in the period after which such a request was filed in the event of such request being refused. The mere existence of the right to file a request for re-establishment of rights in respect of a deemed withdrawn application did not mean that the application was still pending while the period for filing such a request was running. Likewise, the fact that a request for re-establishment of rights was actually filed could not make the application become pending again. The board stated that the point in time when the application was deemed to be withdrawn was the point when the due time for payment of the renewal fee expired; the loss of rights occurred on the expiry of the time limit that had not been observed and, as such, was final in itself. Filing a request for re-establishment did not provisionally revive a deemed withdrawn application. As to whether the applicant enjoyed substantive rights in respect of the earlier application which were (still) subsisting when the later application was filed (see **G 1/09**, OJ 2011, 336), the Legal Board held that in the case at issue the substantive rights under **Art. 64 EPC** were no longer subsisting. As to other possible rights, the right of the inventor under **Art. 60 EPC** was held to be no longer subsisting when the divisional application was filed, since the right ceased to exist if and when the application was finally refused, or was withdrawn or deemed to be withdrawn. The board also rejected the appellant's argument that the right to request re-establishment was a substantive right.

3.5.7 Pendency in case of deemed withdrawal of earlier application and no reaction to loss of rights communication under **Rule 112(1) EPC**

In **J 10/16** the Legal Board found that a divisional application could not be filed from the point in time at which the parent application was deemed to have been withdrawn (here: after expiry of the six-month period under **R. 161(1) EPC**) and if the applicant did not act on the communication noting this loss of rights under **R. 112(1) EPC**. Where, after receiving such a communication, the applicant did not apply for a decision under **R. 112(2) EPC**, the rights were lost on expiry of the original unobserved time limit (see e.g. **J 4/86**, OJ 1988, 119; **G 1/90**, OJ 1991, 275; **G 4/98**, OJ 2001, 131; **J 19/01**; **J 9/02**); the communication became final; and the proceedings came to an end also **on expiry of the original time limit** – unless the legal effect in question was set aside by either further

processing or re-establishment of rights. Communications under R. 112(1) and decisions under R. 112(2) EPC were purely declaratory findings of a loss of rights already having arisen by operation of law (see J 1/05).

3.5.8 Pendency in case of withdrawal of earlier application

The case underlying J 20/12 concerned a parent application which had been unconditionally withdrawn but the appellant had filed a **request to correct this withdrawal**. This request was ultimately refused by the Legal Board of Appeal (in decision J 1/11). After the request for correction, the appellant had filed a divisional application, which the Receiving Section decided not to process because the parent application had been withdrawn and, according to R. 36(1) EPC, an applicant could only file a divisional application relating to any pending earlier European patent application. The Legal Board saw no difference between the case of an application deemed to be withdrawn due to the non-payment of fees (which had been dealt with in J 4/11, OJ 2012, 516) and an application that had been voluntarily withdrawn by a communication from the applicant. In neither case was the withdrawal the result of a decision taken by the Office. From the wording of Art. 67(4) EPC ("withdrawn" in contrast to "finally refused"), and the further clarification given in decision J 4/11, it could be concluded that an application was no longer pending as from the moment it had been withdrawn. This was not altered by the possibility of filing a request for correction of a withdrawal under R. 139 EPC, nor by the actual filing of such a request. It was not necessary for the board to decide what the position would have been if the request for correction pertaining to the parent application had been allowed.

3.6. Time limits under Rule 36(1)(a) and (b) EPC in the version in force between 1 April 2010 and 31 March 2014

3.6.1 Changes to Implementing Regulations

In the original version of R. 25 EPC 1973 of 1.10.1988, a divisional application could be filed only up to the date on which the applicant approved the text in which the patent was to be granted under R. 51(4) EPC 1973 (in the version which entered into force on 1.09.1987). For a brief overview of the case law in respect of the version of 1.10.1988 see "Case Law of the Boards of Appeal of the EPO", 6th edition 2010, p. 389-390. Under R. 25(1) EPC 1973 in the amended version of 2.1.2002, the applicant could file a divisional application in respect of any pending earlier European patent application (see "Case Law of the Boards of Appeal of the EPO", 6th edition 2010, p. 390-391). This requirement of pendency was adopted into R. 36(1) EPC. Between 1 April 2010 and 31 March 2014, R. 36(1) EPC additionally required that the divisional application must be filed within the time limits laid down in R. 36(1)(a) and (b) EPC. The nature of the communication starting the time limit for voluntary division (R. 36(1)(a) EPC) was specified with effect from 26 October 2010. The requirements under R. 36(1)(a) and (b) EPC were removed in the amended version of R. 36(1) EPC which entered into force on 1 April 2014.

3.6.2 Interpretation of R. 36(1)(a) and (b) EPC

In J 13/13, the Receiving Section had considered the applicant's filing of a divisional application on 7 February 2012 to be too late because the examining division had already issued a first communication objecting to a lack of unity of invention (Art. 82 EPC) in the parent application on 30 October 2009. The applicant contested this finding on the basis that the examining division had issued a second communication objecting to an infringement of R. 43(2) EPC on 11 October 2011 and so the time limit ought to have been calculated in accordance with R. 36(1)(b) EPC rather than R. 36(1)(a) EPC (each as in force from 26 October 2010 until 31 March 2014). The Legal Board disagreed: the communication issued on 30 October 2009 had to be regarded as both a "first communication" within the meaning of R. 36(1)(a) EPC and, since it had raised an objection under Art. 82 EPC, a communication within the meaning of R. 36(1)(b) EPC. By contrast, the objection raised in the second communication did not meet the R. 36(1)(b) EPC requirements because R. 43(2) EPC said it was "[w]ithout prejudice to Article 82", which had to be interpreted as meaning that its provisions had no bearing for the purposes of that article. The Receiving Section had therefore been right to calculate the time limit as running from the issue of the first communication; it had triggered both the time limit under R. 36(1)(a) EPC and that under R. 36(1)(b) EPC.

4. Procedural questions

4.1. Procedural independence of divisional application

The procedure defined in the EPC for the filing of divisional applications is self-contained and complete (see e.g. T 587/98, OJ 2000, 497). The procedure concerning the divisional application is, in principle, independent from the procedure concerning the parent application. Although there are some connections between the two procedures (e.g. concerning time limits), actions (or omissions) occurring in the procedure concerning the parent application after the filing of the divisional application should not influence the procedure concerning the latter (G 4/98, OJ 2001, 131). The parent application also does not have any procedural priority over the divisional application, which is like any other application and in particular does not have subordinate procedural status (T 1177/00, T 1176/00).

The consequence of the procedural independence of the divisional application can be seen in T 1254/06. In this case, the examining division had refused the divisional application and the applicant did not appeal. In the appeal proceedings concerning the parent application (in which the applicant had made the same requests as in the proceedings concerning the divisional application) the question arose whether the legal force of a **refusal decision** in respect of the divisional application also affected the parent application procedure to the extent that it could prevent the EPO (including the boards of appeal) from dealing with the substance of identical requests. The board stated that the principle that both proceedings were independent meant that a refusal decision in one procedure did **not** have a **preclusive effect** with respect to identical requests in the other procedure. This applied in particular when, as in this case, the refusal decision was made

not by the board of appeal but by the examining division, because the first-instance administrative decision did not have true *res judicata* effect.

In case J.5/07 the appellant had failed to file observations according to Art. 96(2) EPC 1973 (Art. 94(3) EPC). The appellant's request for further processing was rejected on the ground that the omitted act was not completed in due time (Art. 121(2) EPC 1973; R. 135(1) EPC). The appellant filed an appeal against this decision, arguing that the omitted act was in fact completed because in response to the communication a divisional application was filed by the appellant. The Legal Board held that, as a consequence of the principle that a divisional application was legally and administratively separate and independent from the grant proceedings concerning the parent application, the filing of a divisional application could not constitute a response to the invitation by the examining division in the parent application within the meaning of Art. 96(3) EPC 1973 (now Art. 94(4) EPC). There was no logical or legal basis for treating an act during the grant procedure for one application (the divisional) as the procedural step required to make up for a failure to comply with a time limit to be observed in entirely separate grant proceedings (the parent).

The board in T.591/05 could not see how the filing and the status of a divisional application might have had any bearing on the admissibility of the appeal against the parent. In particular, any allegation relating to the circumstances under which the divisional application had been filed (here: appellant had expressed the intention to file a divisional application) might have been pertinent to the legal status of the divisional application, but was irrelevant to the issue of the admissibility of the appeal.

In T.1705/11 the board held that facts, evidence and requests or submissions made or filed in the parent procedure were not automatically part of the divisional procedure. A general citation or a mere reference to facts and/or evidence, such as to prior art documents, filed in the parent procedure but not physically filed or incorporated into the divisional application procedure did not constitute a reservoir upon which a party might draw at its convenience and at any time in the divisional application procedure.

4.2. Designation of contracting states in a divisional application

4.2.1 Deemed designation of all states designated in earlier application at the date of filing of divisional

According to Art. 76(2) EPC 1973, the European divisional application shall not designate contracting states which were not designated in the earlier application. Pursuant to Art. 76(2) EPC all the contracting states designated in the earlier application at the time of filing of a divisional application are deemed to be designated in the divisional application. For divisional applications filed after 1 April 2009, only one designation fee has to be paid (Art. 2(1), item 3 RFees); if this designation fee is not paid in due time, the application is deemed to be withdrawn (R. 36(4) EPC, R. 39(2) EPC).

4.2.2 Payment of fee for each designated State – case law concerning situation prior to 1 April 2009

The following case law concerns the situation regarding divisional applications filed before 1 April 2009, where designation fees had to be paid for each designation of a contracting state (see Art. 2(2), item 3 RFees).

In G 4/98 (OJ 2001, 131) the Enlarged Board of Appeal found that the wording of Art. 78(2) and Art. 79(2) EPC 1973 and the European patent system clearly indicated that up to the due date for payment of the designation fees, the designations had full effect. Only if the designation fees were not paid in due time would the designations not have any effect with respect to acts to be performed after that date, such as the filing of a divisional application. Retroactivity of the effects of non-payment of designation fees would occur only where the EPC explicitly provided for it, i.e. in the case of provisional protection (Art. 67(4) EPC 1973). The applicant might designate all contracting states designated in the parent application in the divisional application, and he might proceed with all of them even if in respect of the parent application he later paid only some or no designation fees. This was in line with the fact that the procedure concerning the divisional application was in principle independent from the procedure concerning the parent application and that the divisional application was treated as a new application (G 4/98 supersedes the decision in J 22/95, OJ 1998, 569).

In J 40/03 the applicant sought to designate a contracting state in a divisional application which was designated in the parent application as filed but for which no designation fee had been paid. The board confirmed the established case law (G 4/98, OJ 2001, 131; J 25/88, OJ 1989, 486; J 19/96) on this issue. The designations in a parent application, all or some of which may be designated in a divisional application, were those in the parent at the time of filing of the divisional application. If the time limit for paying the designation fees had expired and designation fees had been paid for fewer states than those originally designated in the parent, then the divisional could only designate some or all of those states which remained designated in the parent.

In J 1/05 the applicant had paid the designation fee only in respect of one contracting state. After the time limit for the payment of designation fees for the parent application had expired, he filed a divisional application designating all the EPC contracting states. The board confirmed G 4/98 (OJ 2001, 131), in which it was held that only such states as were already designated in the parent application could be designated in a divisional application, or, in the event that the designation fee for the parent application had not been paid, those for which the normal period for payment of the designation fee had not yet expired. After expiry of that period, the provisional designation of any other contracting states was deemed to be withdrawn and the right to designate further states was lost. Moreover, no right to the valid designation of new states in the divisional application could be derived from the fact that an appeal was pending against a notification of a loss of rights under R. 69(2) EPC 1973 (now R. 112(2) EPC) in relation to the parent application.

4.3. Correction of errors in a divisional application

In J 17/97 and J 18/97 the representative had filed the divisional application under a different name than the parent application. The Receiving Section had thus refused to treat the application as a divisional application. The representative filed a request for correction of errors pursuant to R. 88 EPC 1973 (now R. 139 EPC) to replace the name of the applicant of the divisional application with the name of the applicant of the parent application. The Legal Board rejected the request as the appellant had not proved that the divisional application had been filed in error under the wrong name. R. 88 EPC 1973 may not be used to enable a person to give effect to a change of mind or to a subsequent development of plans.

In T 1008/99, the request for correction of errors concerned a divisional application which had been filed with a wrong description unrelated to the earlier (parent) application. The wrongly filed description was therefore to be replaced by the description of the parent application. The board rejected the request and held that, for the purposes of R. 88 EPC 1973, the error had to be **apparent from the divisional application itself**, and the parent application could not be used to demonstrate that the error was obvious. Even if it was apparent from the filed description, claims and drawings that they did not belong together, it was not immediately clear from the divisional application itself which of these parts was incorrect.

4.4. Search fee for a divisional application

It was confirmed in J 7/13 that the relevant provisions for determining the amount of the search fee to be paid for a European divisional application are R. 36(3) EPC and Art. 2(1), item 2, RFees. The time limit for payment in R. 36(3) EPC can only refer to the actual date on which the divisional application documents were received at the EPO. The amount payable does not depend, as contended by the appellant, on the fictitious date of filing accorded to the application under Art. 76(1) EPC, which is conditional on the fulfilment of substantive requirements and likewise has substantive effects.

5. Double patenting

This chapter primarily deals with double patenting arising from the filing of a divisional application, but also treats the matter as it may arise in other procedural situations. The leading decisions on the issue are G 1/05 (OJ 2008, 271) and G 1/06 (OJ 2008, 307), in which the Enlarged Board held that the principle of the prohibition on double patenting was based on the idea that the applicant had **no legitimate interest** in proceedings that gave rise to the grant of a second patent in respect of the **same subject-matter** for which he already held a patent, see in this chapter II.F.5.1. In T 318/14 questions concerning the prohibition of double patenting were once again referred to the Enlarged Board of Appeal (see below).

The technical boards have several times considered the notion of the "same subject-matter". A mere (partial) overlap does not prejudice the grant of a patent (see T 587/98, OJ 2000, 497; T 877/06; T 1491/06; T 1391/07; T 2402/10; T 2461/10; T 1780/12;

T. 621/15). See in this chapter II.F.5.2. On the relevance of the scope of protection for the issue of double patenting, see e.g. T. 1780/12 and T. 2563/11.

Some technical boards have sought to identify the **legal basis** for this prohibition in the EPC and have suggested Art. 125 EPC (see T. 2461/10 highlighting that the "legitimate interest" was a general procedural requirement – see T. 9/00, OJ 2002, 275 – and one of the principles of procedural law generally recognised in the contracting states; see also T. 2563/11 agreeing with T. 2461/10 that this is in line with the travaux préparatoires; but see also T. 307/03, OJ 2009, 422 and T. 1423/07), or Art. 60 EPC (T. 307/03; but see also T. 1423/07 and T. 2461/10). As noted in T. 2461/10, the EPC only contains a provision relevant to the prohibition on double patenting in the context of European and national applications and patents (see Art. 139(3) EPC). Some of these decisions are summarised in this chapter II.F.5.2.

On the matter of double patenting arising not from the filing of a divisional application but from **internal priority** the board in T. 1423/07 held that double patenting was not prohibited for European applications claiming a European priority because of the applicant's clear legitimate interest in the longer term of protection possibly available with the later filing, in view of the fact that the filing date and not the priority date was the relevant date for calculating the 20-year term of the patent. In T. 2461/10, however, the board noted that double patenting could arise in three scenarios: two applications filed by the same applicant on the same day; parent and divisional application; and a (European) priority application and a subsequent (European) application claiming this priority. The board concluded from the travaux préparatoires that prohibition of double patenting applied to all three scenarios. It also highlighted that G. 1/05 (OJ 2008, 271) and G. 1/06 (OJ 2008, 307) had referred to a **legitimate** interest. With reference to the travaux préparatoires the board doubted that the interest identified in T. 1423/07 could be considered legitimate. In the case at issue, the board could leave the question open, as there was no identity of subject-matter but merely an overlap of scope of protection.

In T. 318/14 the board referred the following points of law to the Enlarged Board of Appeal in accordance with Art. 112(1)(a) EPC:

1. Can a European patent application be refused under Art. 97(2) EPC if it claims the same subject-matter as a European patent granted to the same applicant which does not form part of the state of the art pursuant to Art. 54(2) and (3) EPC?

2.1 If the answer to the first question is yes, what are the conditions for such a refusal and are different conditions to be applied where the European patent application under examination was filed

a) on the same date as, or

b) as a European divisional application (Art. 76(1) EPC) in respect of, or

c) claiming the priority (Art. 88 EPC) in respect of

a European patent application on the basis of which a European patent was granted to the same applicant?

2.2 In particular, in the latter case, does an applicant have a legitimate interest in the grant of the (subsequent) European patent application in view of the fact that the filing date and not the priority date is the relevant date for calculating the term of the European patent under Art. 63(1) EPC?

5.1. No legitimate interest in grant of a second patent claiming same subject-matter

The principle of the prohibition of double patenting is based on the idea that the applicant has no legitimate interest in proceedings that give rise to the **grant** of a second patent in respect of the same subject-matter for which he already holds a patent. There is therefore nothing objectionable in the established EPO practice that amendments to divisional applications are objected to and refused, when the same subject-matter is claimed in the amended divisional application as in a pending parent application or a granted parent patent. However, this principle could not be applied with a view to preventing the **filing** of identical applications, because that would infringe the prevailing principle that an assessment of the EPC requirements is made on the basis of the final version put forward (G 1/05, OJ 2008, 271 and G 1/06, OJ 2008, 307).

In T 2563/11 the appellants' line of argument that differences between the descriptions at issue might prove useful in finding fallback positions in any national revocation or infringement proceedings failed to persuade the board that they had a legitimate interest.

5.2. Different subject-matter and scope of protection; overlapping subject-matter

In T 118/91 and T 80/98, care was taken to avoid any risk of double patenting by ensuring that the subject-matter of the divisional application differed from that of the parent application. In T 118/91, in particular, the board stated that it could find nothing to support the contention that features forming part of the subject-matter of the divisional application could not be the subject of a dependent claim in the parent application. The board agreed with the Guidelines that, as a general rule, one application may claim its own subject-matter in combination with that of the other application. This approach does not lead to "double patenting" in its normal sense. In this particular case, the board was satisfied that any danger of "double patenting" had been eliminated by extensive restriction of the claims in the divisional application.

In T 587/98 (OJ 2000, 497) the examining division, relying on the Guidelines prohibiting "conflicting" claims, had refused a European patent application, filed as a divisional application, on the grounds that its subject-matter overlapped with that of the parent application and that in the overlapping region the same subject-matter was claimed; as legal basis for the refusal it invoked Art. 125 EPC. The board held that Art. 125 EPC was not applicable to the case at issue since this article required "the absence of procedural provisions in the Convention" but the provisions governing divisional applications were self-contained and complete. In addition a prohibition of "conflicting" claims in the wide

sense applied by the examining division would be a matter of substantive law rather than a matter of procedure – and Art. 125 EPC was not applicable to substantive law. The board also found that there was no express or implicit provision in the EPC which prohibited the presence in a divisional application of an independent claim – explicitly or as a notional claim arrived at by partitioning of an actual claim into notional claims reciting explicit alternatives – which was related to an independent claim in the parent application (or patent, if it had already been granted) in such a way that the "parent" claim included all the features of the "divisional" claim combined with an additional feature.

In T. 307/03 (OJ 2009, 422) the board understood T. 587/98 to have found that there was no basis in the EPC prohibiting "conflicting claims" within the meaning of the guidelines; it could not follow T. 587/98 on this point. The board in T. 307/03 held that the principle of the prohibition of double patenting, namely that the inventor (or his successor in title) has a right to the grant of one and only one patent from the EPO for a particular invention as defined in a particular claim, can be deduced from Art. 60 EPC 1973. Once a patent had been granted, this right to a patent had been exhausted and the EPO was entitled to refuse to grant a further patent to the inventor or his successor in title for the subject-matter for which he had already been granted a patent. Furthermore, a double patenting objection can also be raised where the subject-matter of the granted claim is encompassed by the subject-matter of the claim later put forward, that is where the applicant is seeking to re-patent the subject-matter of the already granted patent claim, and in addition to obtain patent protection for the other subject-matter not claimed in the already granted patent. In particular, where the subject-matter which would be double patented is the preferred way of carrying out the invention both of the granted patent and of the pending application under consideration, the extent of double patenting cannot be ignored as de minimis. To avoid the objection of double patenting the claims of the pending application should be confined to other subject-matter that is not already patented. See however T. 2402/10 (summarised below).

According to the board in T. 1423/07, Art. 60 EPC provides no basis for refusing a European application for double patenting. The purpose of Art. 60 EPC is only to define to whom the right to a European patent belongs. Art. 60 EPC could not be interpreted such that the inventor or his successor in title had a right to the grant of one and only one patent from the EPO for a particular invention, with the consequence that claims comprising subject-matter included in the claims of an already granted patent of the same applicant were refused no matter whether or not the applicant had a legitimate interest in the grant of the subsequent application.

In T. 1391/07 the board noted that the practice of prohibition of "double patenting" was confined to patents and applications relating to the same invention as defined by the subject-matter of the corresponding claims and therefore confined to claims conferring notionally the same **scope of protection**. It saw no basis for extending this practice to cover claims not defining the same subject-matter but conferring – as in the case before it – a scope of protection overlapping with each other only partially in the sense that some, but not all of the embodiments notionally encompassed by one of the claims would also be encompassed by the other one of the claims. In particular, the lack of legitimate interest of an applicant in obtaining two patents for the same subject-matter – as invoked by the

Enlarged Board of Appeal in decisions G 1/05 (OJ 2008, 271) and G 1/06 (OJ 2008, 307) – cannot be invoked when the scopes of protection conferred by the respective subject-matters **overlap only partially** with each other as there is no manifest objective reason to deny the legitimate interest of the applicant in obtaining a protection different from – although partially overlapping with – that of the parent patent already granted. Accordingly, the board concluded that the mere fact that the scope of protection notionally conferred by the claim in suit would partially overlap with that of the granted parent patent did not prejudice the grant of a patent (see also T 587/98, OJ 2000, 497; T 877/06; T 1491/06; T 1780/12; T 2461/10; T 2563/11).

In T 2402/10 the respondent raised an objection of double patenting, since claim 1 had been amended during the opposition/appeal proceedings in such a manner that its scope fully **encompassed** the scope of the claims of the patent granted from the grand parent application. The board recalled the well-established case law that a principle of prohibition of double patenting existed on the basis that an applicant had no legitimate interest in proceedings leading to the grant of a second patent for the "same subject-matter" (G 1/05, OJ 2008, 271; G 1/06, OJ 2008, 307; see also T 1391/07, T 877/06, T 1708/06, T 469/03). In the case at issue, claim 1 contained technical features not required by any claim of the patent granted from the grant parent application. Since the patent granted from the grant parent application and the patent in suit claimed different subject-matter, the question of double patenting could not arise. The board noted that the respondent also referred to the headnote of T 307/03, according to which a double patenting objection could also be raised where subject-matter of the granted claim was encompassed by the subject-matter of the claim later put forward. The board, however, saw this as no reason to depart from the mandatory requirement of "same subject-matter" invoked in decisions G 1/05 and G 1/06 and in the established case law. See also T 1155/11.

In T 1766/13 the board held that, with respect to the case at issue, a product and a method for its manufacture were not "the same subject-matter" in the sense of G 1/05 and G 1/06. According to T 1765/13, the same was true for the use of a product and a method of fabricating it. For a further case where parent application and divisional application did not relate to the same subject-matter, see T 1708/06.

In T 1780/12 the board held that the category of a claim and its technical features constituted its subject-matter and determined the protection conferred (see G 2/88, OJ 1990, 93). The claims in question were of different categories: **Swiss-type claims** were purpose-limited process claims (Use of X for the manufacture of a medicament for the treatment of Y) and **claims formulated in accordance with Art. 54(5) EPC** were purpose-limited product claims (X for use in the treatment of Y). As regards the technical features, the board concluded that both sets of claims defined the same compound and the same therapeutic use, but that the Swiss-type claims comprised in addition the feature of manufacturing a medicament whereas the claim in accordance with Art. 54(5) EPC did not. The claimed subject-matter was thus different. The board also considered that the scope of protection was noticeably different. It was generally accepted as a principle underlying the EPC that a claim to a particular physical activity (e.g. method, process, use) conferred less protection than a claim to the physical entity per se (see decision G 2/88). It followed that a purpose-limited process claim also conferred less protection than a

purpose-limited product claim. (See also T. 879/12, T. 13/14 and T. 15/14 agreeing with the conclusions in T. 1780/12.)

In T. 2563/11, the appellants had contended that the prohibition on double patenting did not apply because, despite their identically worded independent claims, the parent patent and the divisional application had different descriptions and so each conferred a **different extent of protection** under Art. 69 EPC. The board observed that the important point for the purposes of the prohibition on double patenting was whether the "**same subject-matter**" was claimed. A claim's subject-matter was defined by its category and technical features (Art. 84 EPC and R. 43(1) EPC). The description was therefore irrelevant in establishing whether the same subject-matter was claimed, especially if the claims in question were anyway clear and understandable in themselves (see T. 197/10). By contrast, while the claims were likewise the basis for determining the extent of protection conferred by a European patent, Art. 69(1) EPC provides that the description and drawings were to be used to interpret them for this purpose, and this meant that the extent of protection conferred by the patent might be broader than the subject-matter claimed. In the case in hand, the board rejected the appellants' contention that, owing to the considerable differences between the descriptions, claim 1 of the divisional application covered broader subject-matter than its equivalent in the parent application.

5.3. Double patenting objection in opposition

According to the board in T. 936/04, "double patenting" is not a ground of opposition. It is, however, within the discretion of the departments of the EPO to raise the objection in opposition or opposition appeal proceedings against proposed amended claims, but this should be done **only in clear cases**. The purpose behind the principle of the prohibition of double patenting is to avoid unnecessary duplication of effort, and not to impose on the departments of the EPO an obligation to make a complex comparison between the case before them and the claims that may have been granted in some other proceedings. In the case at issue, at the time of the decision by the opposition division, a patent had not yet been granted on the divisional application. For this reason alone the opposition division was correct to disregard the objections of double patenting raised before it. At that stage it would only be a matter for the examining division, in the proceedings on the divisional application before it, to avoid double patenting by again allowing claims already granted in the parent patent.

III. RULES COMMON TO ALL PROCEEDINGS BEFORE THE EPO

A. The principle of the protection of legitimate expectations

1.	Applicability of the principle of the protection of legitimate expectations	564
1.1.	Sources of legitimate expectations	564
1.2.	Limits of the legitimate expectations principle	565
1.2.1.	Knowledge of the relevant legal provisions and the case law	565
1.2.2.	Interpretation of substantive patent law	566
1.2.3.	Weighing of interests in inter partes cases	566
1.2.4.	Area of party's own responsibility	567
1.2.5.	Administrative notice with no legal consequences	567
1.3.	Causal link and the requirement of proof	567
2.	Information provided by EPO	568
2.1.	Clear and unambiguous communications and forms	568
2.2.	Information provided as courtesy service	568
2.3.	Contradictory acts	569
2.4.	Information provided by telephone	570
2.5.	Decisions of the department of first instance	571
2.6.	Correction of already issued decision	571
2.7.	Information provided in the Guidelines	572
3.	Obligation to draw attention to easily remediable deficiencies	572
3.1.	General principle	572
3.1.1.	Deficiency correctable within the relevant time limit	572
3.1.2.	Obligation to set new time limit	573
3.2.	Examples of cases addressing the obligation to draw attention to easily remediable deficiencies	573
3.2.1.	Language issues	573
3.2.2.	Missing or insufficient fee payments	574
3.2.3.	Electronic filing of documents	575
3.2.4.	Further examples involving easily identifiable deficiencies	575
3.3.	Limits of the obligation to draw attention to easily remediable deficiencies	576
3.3.1.	Area of party's own responsibility	576
	a) Filing of valid appeal	576
	b) Filing of divisional application	576
	c) Bank account information	576
3.3.2.	No obligation to scrutinise submissions for deficiencies	577
4.	Obligation to enquire in case of unclear nature of request	577
5.	Legitimate expectation and case law	578
5.1.	Case law deviating from or overruling the practice	578
5.2.	Point in time from which a new decision which deviates from existing practice becomes generally applicable	579

The principle of the protection of legitimate expectations is a general principle well established in European Union law and generally recognised in the EPC contracting states and board of appeal case law (G 2/97, OJ 1999, 123; see also R 4/09). Its application to procedures before the EPO implies that measures taken by the EPO should not violate the reasonable expectations of parties to such proceedings (G 5/88; G 7/88; G 8/88, OJ 1991, 137). The term "good faith" is also used to describe this concept (J 10/84, OJ 1985, 71; J 38/97; J 19/13; J 19/16).

The protection of the legitimate expectations of users of the European patent system has two main principles. It requires that the user must not suffer a disadvantage as a result of having relied on erroneous information or a misleading communication received from the EPO (see in this chapter III.A.2.). It also requires the EPO to warn the applicant of any loss of right if such a warning can be expected in good faith. This presupposes that the deficiency can be readily identified by the EPO (see in this chapter III.A.3.).

Users of the European patent system, who are parties in proceedings before the EPO, must also act in good faith (G 2/97, R 4/09, T 861/12). An alleged violation of the principle of the protection of legitimate expectations is in itself not a ground for a petition for review under Art. 112a EPC (R 13/11, R 1/16).

1. Applicability of the principle of the protection of legitimate expectations

The principle of the protection of legitimate expectations applies to all procedural actions – whether formal or informal – taken by EPO employees vis-à-vis parties to proceedings (T 160/92, OJ 1995, 35; see also T 343/95; T 460/95 of 16 July 1996; T 428/98, OJ 2001, 494). It applies to both ex parte and inter partes proceedings (T 923/95). The requirements in connection with the principle of good faith to be observed by the EPO are the same vis-à-vis all parties involved in proceedings before the EPO, be they applicants, patent proprietors or opponents (T 161/96, OJ 1999, 331, see also J 12/94). The principle of the protection of legitimate expectations also applies to acts performed by other authorities concerned in Euro-PCT proceedings during the international phase such as the US Patent Office acting as receiving Office or as International Preliminary Examining Authority (J 13/03). It applies also to the conduct of national authorities when dealing with European patent applications filed with them under Art. 75(1)(b) EPC (J 34/03).

1.1. Sources of legitimate expectations

Sources of legitimate expectations include information provided by the EPO in individual cases (e.g. in the form of communications to the party), information contained in official statements of general applicability and published by the EPO (e.g. the Guidelines and the Official Journal), established practice of departments of the EPO, and decisions taken by the Enlarged Board because of its special role (see J 25/95, J 13/05; see also T 905/90, OJ 1994, 306, Corr. 556). The case law of the boards of appeal may also be a source of legitimate expectation, in particular, if it is established case law which has become enshrined in the consistent practice of the department of first instance (see J 27/94, OJ 1995, 831; see also in this chapter III.A.5.). Courtesy services provided by the EPO

may also be a source of legitimate expectation (see J.1/89, OJ 1992, 17; see also in this chapter III.A.2.2.).

1.2. Limits of the legitimate expectations principle

1.2.1 Knowledge of the relevant legal provisions and the case law

Parties to proceedings before the EPO – and their representatives – are expected to know the relevant provisions of the EPC, even when such provisions were intricate (J.27/92, OJ 1995, 288; T.578/14; J.10/17), as well as all notices published by the EPO which are relevant to patent practice (T.267/08). In general, the parties to EPO proceedings are presumed to know the law relating to the EPC, including the relevant decisions of the boards of appeal (R.17/09).

The board decided in J.17/98 (OJ 2000, 399) that the principle of protection of legitimate expectations according to which communications of the EPO, including official forms, must be clear and unambiguous, did not extend so far as to require comprehensive legal advice to be contained in such forms. While forms must be clear and unambiguous, they need not contain detailed explanations of the law. This was especially true for legal issues which directly follow from the provisions of the EPC (see also T.778/00, OJ 2001, 554).

The board decided in J.5/02 that it was not a violation of the principle of the protection of legitimate expectations if the EPO provided a professional representative with incorrect information on the basis of which he concluded that the relevant legal provisions – in this case Art. 122 EPC 1973 – were no longer applicable. If he did not realise the information was incorrect, he was guilty of fundamentally inexcusable ignorance of the law; if he did realise it was incorrect, he was not misled.

In T.267/08 the board held that professional representatives must be expected to be acquainted with all notices published by the EPO which are relevant to patent practice. The new representative should have realised that the Decision of the President of the European Patent Office dated 12 July 2007 on the filing of authorisations (OJ SE 3/2007, L.1) explicitly required an original version of the authorisation to be filed and that the decision of the President of the European Patent Office dated 12 July 2007 concerning the filing of patent applications and other documents by facsimile (OJ SE 3/2007, A.3) forbade the filing of authorisations by fax. The fact that the new representative had previously been notified that the change of representative had been registered should not have misled him into believing that a faxed version of an authorisation would suffice. Only a "fundamentally inexcusable ignorance of the law" (referring to J.5/02) could lead him to this conclusion.

In T.590/18 of 4 July 2018 the board held that a debit order filed on paper (EPO Form 1010) after 1 December 2017 could at most be accepted as a valid payment of the appeal fee if the appellant could successfully claim to have seen still current information clearly indicating the option of paying this way on the EPO website after the entry into force of the change to fee payment methods, to have been entitled to entertain a legitimate expectation as to that information's accuracy, and indeed to have acted in reliance on it.

Finding a PDF version of a brochure published before the change's entry into force was not sufficient to establish such a legitimate expectation, especially when the appellant had anyway known about the change.

The Enlarged Board held in **R. 4/09**, in the context of an alleged breach of the principle of legitimate expectation, that a party to the proceedings, at least where it was represented by an authorised representative, was deemed to know the case law, and cannot plead lack of such knowledge as an excuse, "ignorantia legis non excusat" (see also **T. 736/14**). According to **J. 19/10**, the professional representative could be expected to be familiar with procedural matters in general, and the boards' detailed and consistent jurisprudence in particular.

In **T. 1086/09** the board held that the representative's expectation that a refund of 50% of the appeal fee would be available was not legitimate as it was the consequence of an error in law, i.e. an incorrect reading of the new **R. 103(2) EPC**, which did not apply to the appeal in question.

1.2.2 Interpretation of substantive patent law

In **G. 2/07** and **G. 1/08** (OJ 2012, 130 and 206) the Enlarged Board of Appeal held that there could be no "legitimate expectation" that an interpretation of a substantive provision governing patentability given in a decision of the boards of appeal will not be overruled in the future by the Enlarged Board, since recognising such an expectation as legitimate would undermine the function of the Enlarged Board. This holds particularly true for issues on which there is no solid body of decisions all to the same effect but where instead the relevant jurisprudence consists only of a very limited number of individual decisions.

1.2.3 Weighing of interests in inter partes cases

In **T. 1644/10**, the EPO had published an incorrect patent specification B1 and subsequently corrected it as B9. The appellant had relied on the accuracy of the published specification B1 and consequently failed to file notice of opposition within the prescribed period. The board held that whether the protection of legitimate expectations could be applied in an inter partes procedure where there had been a failure to meet the opposition deadline was subject to a weighing-up of interests. There was no general rule that the patentee's legitimate expectation that the grant decision had become final had to be considered subordinate to the opponent's legitimate expectation that the content of the published patent specification was correct. That would run counter to the rule of equal procedural treatment of the parties. In the case in hand, the appellant could not rely on the applicability of the principle of legitimate expectations in relation to its failure to meet the opposition deadline.

In **T. 595/11** the appellant had enclosed a debit order for a reduced appeal fee with the notice of appeal. The board held that the time frame within which the payment of the fee needed to be checked by the EPO and the party be warned was shorter than the four years that had passed in the present case between the expiry of the time limit for filing the appeal and the time when the Office first made the appellant aware of this issue. The

legitimate expectations of the appellant that the fee payment was in good order and would not be objected to, were indeed established. After weighing up the legitimate interests of all the parties the board concluded that the original error might have had serious and inequitable consequences through the Office's failure to discover it. Therefore, it was equitable that the Office' failure was made good and the error was now allowed to be remedied, as far as possible. Seeing that some adverse effect was inevitable, the board considered that the possibility of a real, but otherwise in itself not necessarily decisive setback for a party (here the non-occurrence of an immediate success) was more preferable than a certain decisive loss of all rights for another party, in particular given the fact that for a long time none of the parties did expect the latter (see also T 1037/11, T 2554/11, T 707/12).

1.2.4 Area of party's own responsibility

The EPO is generally obliged to draw the party's attention to easily remediable deficiencies. However, the principle of good faith does not impose an obligation to warn a party of deficiencies within the area of the party's own responsibility (for more information, see in this chapter III.A.3.3.1).

1.2.5 Administrative notice with no legal consequences

The Enlarged Board observed in G 2/97 (OJ 1999, 123) that the notice sent by the registry of the boards of appeal was a standard form, nothing more than an administrative notice to inform the parties of the reference number of the appeal proceedings. It had no legal consequences; it was not a "communication" within the meaning, for example, of Art. 110(2) EPC 1973 (now R. 100(2) EPC). Such a notice could not be considered to give rise to any misunderstanding.

In T 642/12 the board held that in inter partes appeal cases, the completion of EPO Form 2701 by the formalities officer of the department of first instance does not establish the legitimate expectation that formal requirements of the appeal have already been checked by the EPO.

1.3. Causal link and the requirement of proof

For applicants to be able to claim that they have relied on incorrect information in accordance with the principle of good faith, it has to be established that the erroneous information from the EPO was the direct cause of the action taken by the applicants and objectively justified their conduct (T 460/95 of 16 July 1996; G 2/97, OJ 1999, 123; J 5/02; J 5/07; J 10/17). According to J 27/92, it must be established that, on an objective basis, it was reasonable for the appellant to have been misled by the information. Whether or not this was the case would depend on the individual circumstances of each case.

In T 321/95 the board stated that the alleged oral agreement was not mentioned anywhere in the communications between the primary examiner and the appellant and was not derivable from the content of the file either. Thus, arguments supporting the allegation of a violation of good faith could only be considered as the appellant's personal opinion,

which did not convince the board because there was no evidence that there had been any agreement in the sense mentioned by the appellant instead of simply a "miscommunication" between the primary examiner and the applicant.

In case T.343/95, dealing with the content of a telephone call on which the appellant based its allegation in respect of principle of good faith, the board was of the opinion that even if it was not possible to establish the call's content beyond any reasonable doubt a posteriori, in a case like the one in hand it was sufficient that the board was satisfied on the basis of a balance of probabilities (i.e. that one set of facts was more likely to be true than the other). In the case in hand the conditions for the application of the principle of legitimate expectations were fulfilled (but see T.188/97, where the board could not establish the facts surrounding a telephone conversation with sufficient certainty to invoke the principle of legitimate expectations).

2. Information provided by EPO

2.1. Clear and unambiguous communications and forms

According to the case law of the boards of appeal, the principle of the protection of legitimate expectations governing procedure between the EPO and applicants requires that communications addressed to applicants must be clear and unambiguous, i.e. drafted in such a way as to rule out misunderstandings on the part of a reasonable addressee. A communication from the EPO containing erroneous information which misleads the applicant into taking action causing the refusal of his patent application is null and void in its entirety (J.2/87, OJ 1988, 330). An applicant must not suffer a disadvantage as a result of having relied on a misleading communication (J.3/87, OJ 1989, 3; J.23/14). On the contrary, if his actions were based on a misleading communication he is to be treated as if he has satisfied the legal requirements (J.1/89, OJ 1992, 17).

In T.2092/13 the board concluded that a communication from the examining division was ambiguous and had misled the appellant. In the circumstances of the case, the communication had created a realistic and reasonable expectation that any subsequent negative finding on the issue of novelty and/or inventive step was communicated to the appellant before any adverse decision would be taken. The appealed decision was set aside and the case remitted for further prosecution. See also T.1423/13.

The Legal Board suggested in J.17/04 that it was the EPO's responsibility to provide **forms** which catered for all procedural possibilities in a clear and unambiguous manner. In the case in hand the applicant was allowed to rely on a possible interpretation of the text of the EPO form in accordance with the principle of the protection of legitimate expectations even if another interpretation was more current.

2.2. Information provided as courtesy service

The principle of the protection of legitimate expectations also applies to courtesy services provided by the EPO where these are not worded so as to rule out any misunderstanding on the part of a reasonable addressee. However, an applicant cannot rely on the EPO

systematically providing certain courtesy services and therefore is not entitled to base a claim on their omission (J.12/84, OJ 1985, 108; J.1/89, OJ 1992, 17; J.27/92, OJ 1995, 288; G.2/97, OJ 1999, 123), or on the fact that the communication was not sent to the correct addressee (J.23/10).

In J.1/89 the board held that the applicant was entitled to rely on the accuracy and completeness of information provided as a courtesy service. He could not, however, rely on courtesy services not required by the EPC being systematically provided. If an applicant paid a renewal fee late as a result of a misleading reminder, he had to be treated as if he had paid in time.

In J.34/92 the fifth-year renewal fee had not been paid in full. The professional representative did not receive the communication the EPO usually issues drawing attention to the fact that late payment of the renewal fee was possible upon payment of an additional fee. The loss of rights communication under R.69(1)EPC.1973 made, however, reference to such communication. The board held that the communication drawing attention to the possibility of a late payment plus surcharge was only a courtesy service of the EPO. The applicant could not draw any conclusions in his favour from the fact that this communication was not sent.

In J.27/92 (OJ 1995, 288) the appellant's representative had relied on the advice given by the Information Office by telephone as to the amount of the examination fee payable. The board held that where such a service had been rendered, an applicant was entitled to rely upon its content if the – written or oral – communication from the EPO was the direct cause of the action taken and, on an objective basis, it was reasonable for the appellant to have been misled by the information. See also J.10/17.

2.3. Contradictory acts

In J.27/94 (OJ 1995, 831) the board decided that if a declaration which was subject to a condition and therefore invalid was treated as a valid procedural act by the EPO, the EPO was not allowed later to go back on its own earlier conduct which served as a basis for the applicant's decision on how to proceed, because this would have represented "venire contra factum proprium" and thus offended against a generally recognised legal maxim (see also T.1825/14).

In J.14/94 (OJ 1995, 824), the applicant had failed to pay the third renewal fee. Nevertheless, the EPO continued the examination procedure for several years without informing the applicant of any loss of rights. The board held that if, during a long period of time, the EPO by its conduct led the parties and the public to the legitimate belief that no loss of rights had taken place, the EPO could not later refer to a loss of rights which occurred several years previously as this would constitute "venire contra factum proprium" and therefore contravene the principle of legitimate expectations. In such circumstances, the late payment of a renewal fee might – by way of exception – be considered as having been made in time if the EPO had not informed the applicant of the outstanding payment, had accepted later renewal fees without objection and had continued the examination proceedings for several years.

In J.1/08 the Legal Board concluded that the mere fact that for an admittedly extremely long time period (from August 2004 to March 2007) the EPO had simply not dealt with the application was not sufficient to justify a legitimate expectation on the applicant's side that the application would be regarded by the EPO as still pending. The situation before the board therefore differed from the facts in J.14/94, where the EPO had actively continued the examination proceedings for several years (see also J.19/16).

In J.18/96 (OJ 1998, 403) the board accorded a filing date to protect an applicant's legitimate expectations, although he had not fulfilled a requirement under Art.80.EPC.1973. By issuing a communication under R.85a.EPC.1973 (deleted in EPC 2000), the Receiving Section had given him the impression that his application was validly filed (see also J.5/89). In T.926/09 the board treated the claims in question as if they had been originally filed with the application whereas they had in fact been filed in the period before receipt of the European search report and thus in breach of R.86(1).EPC.1973. The appellant was entitled to rely on the communication by the Receiving Section indicating that the set of claims was admitted.

In T.2364/12 the board set aside the opposition division's decision holding the opposition inadmissible on the grounds that the notice of opposition was deemed not to have been filed in due time. The board found that the opponent could, on the basis of the opposition division's communication informing the appellant that the opposition fee was considered to have been validly filed, reasonably assume that the opposition had been validly filed. See also chapter III.B. "Right to be heard".

In T.2246/13 the board held that the letter by which the EPO cancelled the oral proceedings and announced that the procedure would be continued in writing in itself resulted in a legitimate expectation on the part of the appellant that it would have the opportunity to file observations, if only to be able to react to the changed situation resulting from the other party's withdrawal of its request for oral proceedings. The appellant thus could not expect that a decision revoking the patent would be issued on the same date. The board set the opposition division's decision aside. See also T.1423/13.

2.4. Information provided by telephone

In T.160/92 (OJ 1995, 35) the board did not deny that the principle of legitimate expectations should govern all the actions of EPO employees towards parties to the proceedings, including telephone conversations which were not provided for in the EPC and did not, as such, form part of the formal procedure before the EPO. However, since telephone conversations did not form part of the said formal procedure, the board did not consider it necessary to conduct a detailed investigation seeking to clear up what had been said in the relevant telephone conversations, the sequence of procedurally relevant facts having been clearly established in the file.

In T.428/98 (OJ 2001, 494) the board held that an appellant might rely on information which the board's registrar could be proved to have provided by telephone concerning the method for calculating a time limit the appellant had to observe before the board if the

point of law on which that information was based had at that time not yet been clarified in the case law of the boards of appeal.

In [T 1785/15](#) the appellant had been led to believe in a telephone conversation with a formalities officer that an appeal against the decision to grant would be possible. The board held that the appeal was inadmissible. Suggesting a legal remedy where there was none was at best misleading. The board considered it was likely that the applicant had filed the appeal based on incorrect advice from the Office. The applicant thereby had at least a legitimate expectation that the appeal would be found admissible and examined as to its substance, which led the board to order the reimbursement of the appeal fee.

2.5. Decisions of the department of first instance

In [T 1448/09](#) the board held that the appellant was not at fault in failing to address, in its statement of grounds of appeal, a reason which, in the circumstances, could genuinely have been misunderstood. The principle of good faith required adverse decisions not to contain any ambiguity that could affect their comprehensibility.

2.6. Correction of already issued decision

In [T 1081/02](#) the board held that the communication issued by the opposition division's formalities officer during the period for appeal, stating that the decision already issued had been sent by mistake and should therefore be disregarded, could not constitute a legally sound basis for regarding the decision's validity as so doubtful that it could be considered void. According to the applicable principle of the protection of legitimate expectations, however, the parties could not be deemed to have failed to comply with the time limit for filing a notice of appeal (Art. 108 EPC 1973) (see also [T 1176/00](#), [T 466/03](#)).

In [T 830/03](#) the opposition division had issued a second written decision together with a communication which suggested that the first written decision was superseded. The opponent filed a notice of appeal outside the period of four months after the date of the notification of the first decision, but within the time limit after the notification of the second decision. The board held that the only legally valid written decision was the first decision but that, in application of the principle of protection of legitimate expectations, the appeal was deemed to have been filed in time (see also [T 993/06](#)).

In [T 124/93](#) the opposition division, after having delivered its decision, re-delivered the same with an additional enclosure under a new mailing date. This had misled the parties about the time limit for filing the notice of appeal and statement of grounds. Applying the principle of the protection of legitimate expectations, the board ruled that the appeal was to be considered as filed in due time (see also [T 130/07](#), [T 972/05](#)).

In case [T 105/11](#) the examining division, following a request of the applicant, had re-issued the written decision, in corrected form, with a new date. The board established that the date of the notification of the decision refusing the application remained the date of notification of the first written decision. Whilst the notice of appeal was received in time, the statement of grounds of appeal was not. The professionally represented appellant,

who had explicitly requested that the written decision be corrected, should have been aware that the second decision intended to correct the first written decision under R. 140 EPC. Moreover, different from other cases, in the case in hand there had been no explicit statement by the EPO that the first decision was to be ignored. Nevertheless, it was still imputable to the EPO that the second written decision had not been correctly and unambiguously identified as being a correcting decision. The board held, in application of the principle of the protection of legitimate expectations, that the statement of grounds of appeal was deemed to have been filed in time.

2.7. Information provided in the Guidelines

The board in T. 1607/08 recalled that the Guidelines published by the EPO were one of the sources of legitimate expectations. Therefore, where the Guidelines gave the clear indication that the continuation of the opposition proceedings had to be communicated to the patent proprietor, the latter was entitled to expect that such information would be given before a decision on the substantive issues was issued. Otherwise, as in the case in hand, the decision to revoke the contested patent would come as a surprise to the patent proprietor.

3. Obligation to draw attention to easily remediable deficiencies

3.1. General principle

In accordance with the principle of good faith, the EPO is obliged to warn users of the European patent system of omissions or errors which could lead to a final loss of rights. A warning would always be necessary when one could be expected in all good faith (G. 2/97, OJ 1999, 123). This would presuppose that the deficiency could be **easily identified** by the EPO and the applicant was in a position to **correct the deficiency** and thereby avoid the impending loss of rights (J. 13/90, OJ 1994, 456). In other words, the EPO can only be expected to warn a party of a deficiency if the deficiency is readily identifiable by the EPO, and the party can still correct it within the relevant time limit (G. 2/97, J. 13/11).

The principle of good faith does not impose an obligation to warn a party of deficiencies **within the area of the party's own responsibility** (G. 2/97; see in this chapter III.A.3.3.).

3.1.1 Deficiency correctable within the relevant time limit

In J. 13/11 the appellant requested re-establishment in respect of the time limit for paying the third renewal fee on the last day for doing so and after EPO office hours. The board held that there was no time for the EPO to warn the appellant about the non-payment of the third renewal-fee and surcharge even if the EPO had been in a position to spot this deficiency. The board distinguished the case in hand from T. 14/89 (OJ 1990, 432) where the EPO had had ample time, about six weeks before the expiry of the time limit for requesting re-establishment, in which to inform the proprietor of the deficiencies of his request.

See also T. 1764/08 (concerning the electronic filing of the notice of appeal on the last day of the time limit) and the cases referred to therein, in this chapter III.A.3.2.3. See also in this chapter III.A.3.2.2 (missing or insufficient fee payment).

3.1.2 Obligation to set new time limit

The Legal Board held in J. 13/90 (OJ 1994, 456) that if the applicant could expect to receive a communication warning him of an impending loss of rights, but that communication was not issued in due time, the EPO must set a new period allowing the applicant to remedy the deficiency and perform the omitted procedural act in due time (see also T. 14/89). However, this only applies to non-absolute time limits, as an absolute time limit (such as the one year time limit under Art. 122(2), third sentence, EPC 1973, R. 136(1) EPC), by definition, is non-extendable (J. 34/92, but see also J. 6/08).

3.2. Examples of cases addressing the obligation to draw attention to easily remediable deficiencies

3.2.1 Language issues

In J. 3/00 the appellant filed an international patent application at the EPO as receiving Office under the PCT (RO/EPO). The description and claims were filed, by mistake, in Swedish, a language which the RO/EPO did not accept for filing international applications. The board held that this deficiency in the application was immediately and readily identifiable by the receiving Office on the face of the application in the course of the Art. 11(1) PCT check. The appellant could in good faith have expected a warning.

In T. 1152/05 the notice of appeal was filed in Dutch and thus not in one of the official language of the EPO; this document was, in accordance with Art. 14(4) EPC, deemed not to have been filed. In the board's view, there was prima facie no reason for the formalities officer to consider that the patent proprietor would not be entitled to file its notice of appeal in Dutch. As the deficiency was not readily identifiable, the EPO was not obliged to warn the patent proprietor of the fact that it could not benefit of the provisions of Art. 14(4) EPC.

In T. 41/09 the appellant (patent proprietor), a legal entity having its principal place of business in Spain, filed the notice of appeal in Dutch. The appellant argued before the board that, since the EPO was aware of its nationality, the language deficiency was readily identifiable. The board held that there was no breach of the principle of legitimate expectations of the appellant. It distinguished the situation in the case in hand from the facts of J. 13/90. In this decision, the deficiency had been readily apparent from the request itself whereas in the case in hand it was not readily apparent from the notice of appeal, which only referred to the name of the appellant, without any indication of the location of its principal place of business.

See also the following cases, in which the notice of appeal was filed by a Swiss company in Dutch: T. 642/12 (appeal was deemed not to have been filed) and T. 595/11, T. 1037/11, T. 2554/11, T. 707/12 (appeal was deemed to have been filed and considered admissible).

3.2.2 Missing or insufficient fee payments

J 2/94 involved a letter comprising a request for re-establishment without the necessary payment. According to the board the appellant could not have expected to be informed of the missing fee immediately after receipt of his request for re-establishment by the EPO. There had been no evident indication in the appellant's submission which made a clarification or reminder necessary. Indeed, the EPO could, in practice, often establish whether a specific fee had been paid only after the relevant time limit had expired, once the complete data on all payments made during that period was available (see also T 1815/15).

In G 2/97 (OJ 1999, 123) the Enlarged Board of Appeal held that the principle of good faith did not impose any obligation on the boards of appeal to notify an appellant that an appeal fee was missing when the notice of appeal was filed so early that the appellant could react and pay the fee in time, if there was no indication – either in the notice of appeal or in any other document filed in relation to the appeal – from which it could be inferred that the appellant would, without such notification, inadvertently miss the time-limit for payment of the appeal fee.

Prior to G 2/97, the boards had held in a number of decisions that the EPO had a duty to warn the parties of missing or insufficient fee payments. These included T 14/89 (OJ 1990, 432), J 13/90 (OJ 1994, 456), J 15/90 of 28 November 1994 and T 923/95 (for further details the reader is referred to the "Case Law of the Board of Appeal", 7th ed. 2013, III.A.3.2.2). The Enlarged Board held with regard to T 14/89 that the case turned on its particular facts and that there was no generally applicable principle to be derived therefrom. The board in T 642/12 suggested that the approach in T 923/95 was no longer tenable as it plainly contradicted the findings of G 2/97.

In T 296/96, only 50% of the appeal fee was paid before the expiry of the time limit under Art. 108, first sentence, EPC 1973. However, since the formalities officer invited the appellant to pay the remainder of the appeal fee and accepted its subsequent payment without comment, the appellant could assume in all good faith that the appeal was deemed to have been filed (Art. 108, second sentence, EPC 1973) and that, as a consequence, it was not necessary to file a request for re-establishment. The appellant, who was misled by the action of the formalities officer, must, in accordance with the principle of the protection of legitimate expectations, be treated as having paid the appeal fee in time.

In T 161/96 (OJ 1999, 331) the board came to the conclusion that there was no basis for assuming an obligation on the part of the EPO to warn the party of an impending loss of rights relating to an underpayment of 40% of the opposition fee.

In T 445/98 the board considered that, because the department which cashed the fee was not the same as the one which received the notice of appeal, the deficiency was not easy to identify and the time between payment of the appeal fee and expiry of the non-observed two-month time limit for filing the notice of appeal was too short, so that the opponent could not expect a warning.

In T 642/12 the board held that a potential possibility of discovering the error (80% instead of 100% of the appeal fee had been paid) was not sufficient to establish the legitimate expectation that a registrar of the boards of appeal would warn an appellant within seven working days before the expiry of the time limit that a reduced appeal fee had been relied on in error. The appeal fee was thus deemed not to have been paid (but see T 595/11 in this chapter III.A.1.2.3).

3.2.3 Electronic filing of documents

Under the EPO Notice dated 3 December 2003 concerning the electronic filing of documents (OJ 2003, 609) the electronic filing of documents was not admissible in opposition and appeal proceedings. This is no longer applicable, see Decision of the President of the EPO dated 9 May 2018 (OJ 2018, A45). There are numerous cases which deal with the electronic filing of the appeal before this became permissible. In the earlier cases, the boards accepted that the appeals were admissible on the basis of the principle of legitimate expectation, see T 781/04 of 30 November 2005 and T 991/04 of 22 November 2005 (for more details see "Case Law of the Boards of Appeal of the EPO", 6th ed. 2010, VI.A.2.2.); this changed once a warning had been built into the *epoline*[®]-system that the filing of appeals by electronic means was not permitted (T 331/08).

In T 1764/08, the appellant filed its statement setting out the grounds of appeal via *epoline*[®] on the very last day of the period specified in Art. 108, third sentence, EPC. The board held that, even if the EPO had warned the appellant, the warning would not have allowed the appellant to re-file the statement of grounds of appeal by an acceptable means within said period. Therefore, under the principle of good faith, there was no duty on the part of the EPO to warn the appellant. To that extent, the case in hand differed from cases T 781/04, T 991/04 of 22 November 2005, T 514/05 and T 395/07, where the deficiency could have been identified in good time before the expiry of the relevant period.

3.2.4 Further examples involving easily identifiable deficiencies

In T 460/95 of 16 July 1996 the board found that in the case in hand the irregularity was obvious and easy to identify, and the appellant could easily have put it right during the time remaining. The registrar, when he received the request for an extension, could and indeed should have seen that it was based on a misunderstanding during a telephone conversation.

The principle of legitimate expectations was applied in J 11/89 where the Receiving Section failed to take any particular action upon the receipt of patent documents intended to be considered as priority documents, but whose priority was not claimed in the request for grant.

3.3. Limits of the obligation to draw attention to easily remediable deficiencies

3.3.1 Area of party's own responsibility

The case law demonstrates that the principle of good faith does not impose an obligation to warn a party of deficiencies within the area of the party's own responsibility (G 2/97, OJ 1999, 123; see inter alia J 41/92, OJ 1995, 93; J 4/96; T 690/93; T 161/96, OJ 1999, 331; T 778/00, OJ 2001, 554; T 267/08; R 4/09; T 578/14). The reason for this is that users of the European patent system, who are parties in proceedings before the EPO must act in good faith, and have the responsibility to take all necessary procedural actions to avoid a loss of rights (G 2/97, R 4/09).

a) Filing of valid appeal

The Enlarged Board of Appeal held in G 2/97 that the appellant's responsibility for fulfilling the conditions of an admissible appeal could not be devolved to the board. There can be no legitimate expectation on the part of users of the European patent system that a board will issue warnings with respect to deficiencies in meeting such responsibilities. To take the principle of good faith that far would imply that the boards would have to systematically assume the responsibilities of the parties to proceedings before them, a proposition for which there was no legal justification in the EPC or in general principles of law.

In T 267/08 the board made it clear that it was under no obligation to warn a party of deficiencies in the filing of an authorisation; rather, the party itself had the responsibility to take all necessary steps to avoid a loss of rights. Responsibility for filing a valid authorisation could not be devolved to the board.

b) Filing of divisional application

In J 2/08 (OJ 2010, 100), the appellant (applicant) contended that the EPO had violated the principle of good faith on several occasions (omission to inform in respect of filing a divisional application; publication of the divisional application; late noting of loss of right). In his view, by taking no action the EPO induced the appellant into believing that everything was in good order with the divisional application, until it became too late to file an appeal against the decision refusing the parent application. In the board's view it was exclusively the responsibility of the applicant and his representative to decide on the factually and legally most appropriate filing actions to be taken. Furthermore no legitimate expectations concerning the validity of an application may be based on the fact that an application has been published. Finally, the communication under R. 69 EPC 1973, which is not just a warning but a procedural act, had to be sent after the end of the appeal period.

c) Bank account information

The board in T 1029/00 decided that the appellant could hardly cite the lack of bank account information on EPO correspondence as the reason for making an incorrect cash payment. Applicants had to ascertain such bank account information for themselves.

3.3.2 No obligation to scrutinise submissions for deficiencies

J 7/97 concerned an application filed with the EPO by fax. One page of the description was missing, whilst another was transmitted twice. The board took the view that a single page missing from a lengthy description was not an "obvious error" under the case law, at least in the circumstances of this particular case. The applicant could not in good faith expect the EPO to check application documents for completeness on the very day it received them. Nor could any such obligation be inferred from the President's decision on fax transmissions (OJ 1992, 299), in which Art. 3 (now Art. 6, Decision of the President of the EPO of 12 July 2007, OJ SE 3/2007, 7) required the filing office to notify the sender as soon as possible "where a document transmitted ... is illegible or incomplete"; the latter adjective clearly referred to the transmission rather than the actual document.

In T 585/08 the board found that the deficiency in the request for re-establishment (insufficient statement of grounds and facts, R 136(2) EPC) had not been readily identifiable. First, a number of letters had been filed, and second, it would only have been possible to detect the deficiency if these letters had been studied carefully. In the board's view, the principle of good faith did not impose any obligation on the EPO to scrutinise several letters on file to establish whether grounds and facts with respect to a request for re-establishment were missing. The board distinguished this case from T 14/89 (OJ 1990, 432) in which the lack of substantiation of the request for re-establishment had been readily identifiable.

4. Obligation to enquire in case of unclear nature of request

In J 15/92 the Legal Board held that in the case of a request whose true nature was uncertain (here it was unclear whether it was a request for re-establishment or a request for a decision), the EPO should clarify the matter by asking the requester. It would have been sufficient in the case in hand for the EPO to invite the applicant to define his request more precisely. For the EPO to interpret the request arbitrarily constituted an error rendering the impugned decision null and void (see also J 25/92, J 17/04).

In J 6/08 the board added that a request (for a decision or re-establishment) filed with a view to obtaining the redressal of a loss of rights within the meaning of R 69(1) EPC 1973 had to be interpreted by the EPO in the light of the requester's objectively discernible will and taking account of the particular circumstances of the case. In case of doubt the Office is obliged to establish what the requester really wanted and may also be obliged to point out any still outstanding procedural steps in connection with this request (in this case, observance of the period of one year under Art. 122(2) EPC 1973).

Though not expressly relying on the principle of legitimate expectation, the Enlarged Board of Appeal held in R 14/10 that in cases where a request of a party during oral proceedings was considered unclear, it was the duty of the deciding body to ask for clarification before deliberation. However, if the requests as read out before the debate was declared closed did not correspond to the petitioner's intention, it was the petitioner's duty to intervene at that point.

5. Legitimate expectation and case law

There might be cases in which the public has a legitimate expectation that the department of first instance will not deviate from the **established case law** which has become enshrined in the consistent practice of the department of first instance (see J.27/94, OJ 1995, 831). A **single decision** of a board of appeal cannot, however, create a legitimate expectation that it will be followed in future (J.25/95, T.500/00). The users' confidence in the continuity of a practice based on a decision of the Enlarged Board might be considered particularly legitimate since all boards of appeal were expected to follow the Enlarged Board's interpretation of the EPC (J.25/95).

5.1. Case law deviating from or overruling the practice

In J.27/94 (OJ 1995, 831) the board stated that there might be cases in which the public had a legitimate expectation that the department of first instance would not deviate from the established case law. This might apply if the relevant case law had become enshrined in the consistent practice of the department of first instance, and in particular if this had been made known to the public in published Guidelines, Legal Advice or Notices from the EPO. In such a situation, an applicant might legitimately expect that a practice allowing or even recommending a particular way of proceeding would not be changed without appropriate advance information. In the case in hand, the board held that the department of first instance was therefore not obliged by the principle of the protection of legitimate expectations, on the basis of decision J.11/91 (OJ 1994, 28), to allow the filing of a divisional application after the approval of the text intended for grant until opinion G.10/92 (OJ 1994, 633) was made available to the public.

In J.25/95 the board stressed that the publication of J.11/91 in the Official Journal of the EPO (OJ 1994, 28) as well as in the publication "Case Law of the Boards of Appeal of the EPO" did not create a legitimate and reasonable expectation that a divisional application could be filed up until the decision to grant. If there was any doubt whether the established practice in this respect existed, it was up to the appellants to seek clarification by means of an enquiry to the EPO which would have revealed quickly that the department of first instance did not apply J.11/91.

In T.740/98 the appellant submitted that the disclaimer had been allowed by the examining division in conformity with the Guidelines for Examination (1994 version) and the then established case law of the boards of appeal. Consequently the standards set out in the subsequent decision G.1/03 (OJ 2004, 413) could not be applied, since this would offend against the principle of good faith and the protection of the legitimate expectations of the users of the EPO. The board noted that the legal system established under the EPC did not treat either the Guidelines or established case law as binding. Thus, any principle of protection of legitimate expectations could not be based on earlier Guidelines or case law. The board held that the standards set out in G.1/03 were applicable to the case. In T.500/00 the board added that what counted was not whether the opposition division had acted in accordance with the Guidelines, but whether it had acted in accordance with the EPC. The principle of good faith could not be invoked against the application of principles concerning the allowability of disclaimers laid down in G.1/03 to pending cases.

5.2. Point in time from which a new decision which deviates from existing practice becomes generally applicable

In three decisions the Enlarged Board of Appeal reached the conclusion that these decisions overturning earlier rulings would not be applied up to the date on which they were made available to the public (G 5/88, OJ 1991, 137, concerning an administrative agreement; G 5/93 OJ 1994, 447 concerning the possibility for Euro-PCT applicants to have their rights re-established with regard to the time limit for paying the national fee provided for in R 104b EPC 1973; and G 9/93, OJ 1994, 891, holding that a European patent cannot be opposed by its own proprietor, thereby overturning G 1/84). These three decisions do not, however, form the basis of a general rule that new case law must never be applied "retrospectively" (J 8/00).

In T 716/91 the board came to the conclusion that G 4/93 (corresponding to G 9/92, OJ 1994, 875) had also to be applied to pending cases. The situation in the case in hand was not analogous to the situation in G 9/93, where the Enlarged Board of Appeal had held that it was inequitable to apply the law as interpreted in G 9/93 to pending cases. The board pointed out that G 4/93 did not contain any indication limiting the applicability of the law as interpreted therein to pending cases.

In T 739/05, the board saw no reason to suspend the further prosecution and the final decision of the case until a decision of the Enlarged Board of Appeal was issued on an important point of law which might have been of importance for the case under consideration. The board held that the decision of the Enlarged Board of Appeal could not affect the outcome of the case because of the principle of the protection of legitimate expectations relating to pending cases. Where existing long-standing practice laid down in publications of the EPO is overruled by a new decision, consistent case law (G 5/93, G 9/93, T 905/90, J 27/94, J 25/95) allows the applicants of pending cases a transitional period during which they may rely on the previous practice until the modifying decision is made available to the public.

The decision G 2/08 (OJ 2010, 456) stated that in order to ensure legal certainty and to protect legitimate interests of applicants, the interpretation of the law given by the Enlarged Board in this decision should have no retroactive effect, and an appropriate time limit of three months after publication of the present decision in the Official Journal of the EPO was set in order for future applications to comply with this new situation.

In G 2/07 and G 1/08 (OJ 2012, 130 and 206) the Enlarged Board of Appeal held that, in the past, it had granted a transitional period in cases in which its decision had brought about a change in relation to an established procedural practice, which change the parties could not be expected to foresee. By contrast, the existence of "legitimate expectations" has never been acknowledged for issues before the Enlarged Board concerning the correct application, i.e. interpretation, of substantive patent law.

1. Introduction

The right of parties to a fair trial is a generally recognised procedural principle under Art. 125 EPC (**T 669/90**), and is to be observed in all proceedings before the EPO (**R 2/14 of 17 February 2015**). The predictability and verifiability of all state actions are indispensable elements of the rule of law and respect for fundamental procedural rights (**G 3/08**, OJ 2011, 10). It is a fundamental right of the parties which has to be safeguarded, irrespective of the merits of the party's submissions. The necessity to respect it is absolute (**R 3/10**).

Under Art. 113(1) EPC the decisions of the EPO may only be based on grounds or evidence on which the parties concerned have had an opportunity to present their comments. The right to be heard under Art. 113(1) EPC is a fundamental principle (**J 13/10**) and of fundamental importance for ensuring a fair procedure between the EPO and a party to proceedings before it (**J 20/85**, OJ 1987, 102; **G 4/92**, OJ 1994, 149). It is intended to ensure that no party is caught unawares by grounds and evidence in a decision turning down a request on which that party has not had the opportunity to comment (**R 2/14**). In inter partes proceedings Art. 113(1) EPC reflects the principle that each party should have a proper opportunity to reply to the case presented by an opposing party (**G 4/95**).

Under Art. 113(2) EPC the EPO shall examine and decide upon the European patent application or the European patent only in the text submitted to it, or agreed, by the applicant for or proprietor of the patent. This is a fundamental procedural principle, being part of the right to be heard, such that any infringement of it, even as the result of a mistaken interpretation of a request, must, in principle, be considered to be a substantial procedural violation (**T 647/93**, OJ 1995, 132).

A violation of the right to be heard in first instance proceedings may constitute a fundamental deficiency under Art. 11 RPBA that justifies the remittal of the case to the

department of first-instance (see chapter [V.A.7.4.](#)), as well as a substantial procedural violation under [R. 103\(1\)\(a\) EPC](#) that may, if equitable, justify the reimbursement of the appeal fee (see chapter [V.A.9.5.8](#)); see, for example, [T 820/10](#), [T 623/12](#), [J 13/10](#).

A fundamental violation of [Art. 113 EPC](#) in appeal proceedings can be the basis for filing a petition for review to the Enlarged Board of Appeal ([Art. 112a\(2\)\(c\) EPC](#); see chapter [V.B.4.3.](#)). A petition for review can also be based on the failure to arrange requested oral proceedings, and on the failure to decide on a party's request. Both of these additional grounds also reflect an aspect of the right to be heard (see chapter [V.B.4.4.](#) "[Article 112a\(2\)\(d\) EPC](#) – any other fundamental procedural defect"). The case law of the Enlarged Board of Appeal under [Art. 112a EPC](#) is primarily to be found in chapter [V.B.4.3.](#), to which the reader is also directed in order to cover all the jurisprudence in relation to the right to be heard. Decisions on the right to be heard taken by the Legal Board of Appeal and by technical boards of appeal are, on the other hand, almost exclusively dealt with in the present chapter, and only exceptionally referred to in chapter [V.B.4.3.](#) "[Article 112a\(2\)\(c\) EPC](#) – alleged fundamental violation of [Article 113 EPC](#)".

For the right to be heard in **examination proceedings**, see chapter [IV.B.2](#) (in particular chapter [IV.B.2.5](#), on the refusal of an application after a single communication and chapter [IV.B.2.8](#), on issuing a further communication). In **opposition proceedings** the right to be heard is inextricably linked to the principle of **equal treatment**, see chapter [IV.C.6.1](#) and, with regard to opposition appeal proceedings, chapter [V.B.4.3.6](#); as to the opposition division's obligation to invite the parties as often as necessary to file observations, see chapter [IV.C.6.2](#); as to the opportunity to comment on new grounds of opposition, see chapter [IV.C.3.4.6](#). With regard to the observance of the right to be heard in the context of the taking of **evidence**, see chapter [III.G.3.3](#). The right to be heard may also play a role in the decision whether to accept **late filed submissions** (see chapter [IV.C.4](#). "Late submission"). With regard to the requirement for **reasoned decisions** under [R. 111\(2\) EPC](#), see chapter [III.K.3.4](#).

2. The right to be heard under [Article 113\(1\) EPC](#)

2.1. Violation of the right to be heard examined ex officio

The boards of appeal can examine the facts of the case of their own motion pursuant to [Art. 114\(1\) EPC](#) and verify whether or not [Art. 113 EPC](#) has been complied with by the departments of first instance (see e.g. [T 186/02](#)).

2.2. Causal link between the violation of the right to be heard and the final decision

2.2.1 Appeal proceedings

When reviewing appeal proceedings, the Enlarged Board's review is limited to "fundamental" violations of the right to be heard. This requires a causal link between the alleged violation and the final decision. Such a causal link does not exist when, even if a procedural violation can be demonstrated, the same decision would have been taken for

other reasons (see chapter V.B.4.3.2 "Fundamental violation of Article 113 EPC – causal link").

2.2.2 First instance proceedings

When reviewing first instance proceedings the boards' review is, in principle, not limited to fundamental violations of the right to be heard (see above). However, remitting a case to the department of first-instance under Art. 11 RPBA also requires a "fundamental" deficiency in first instance proceedings, and under R. 103(1)(a) EPC the appeal fee is only reimbursed in case of a "substantial" procedural violation. In T. 689/05 the board linked these concepts, stating that a "fundamental" deficiency within the meaning of Art. 11 RPBA is not caused by all procedural violations but rather only by a "substantial" procedural violation. In J. 7/83 a substantial procedural violation was defined as an objective deficiency **affecting** the entire proceedings, in T. 682/91 as a deficiency adversely **affecting** the rights of the parties (see chapter V.A.9.5.2 "Violation must be substantial and affect the entire proceedings").

In T. 990/91 the board held that since there had been no need for the examining division to put forward the new argument – which was supererogatory and incidental – in order to refuse the application, the lack of opportunity to reply to it could not be considered to be a violation of the right to be heard.

2.3. Surprising grounds or evidence

2.3.1 General principles

Art. 113(1) EPC requires that decisions may only be based on grounds or evidence on which the parties concerned have had an opportunity to present their comments.

According to the Enlarged Board of Appeal (see chapter V.B.4.3.8 "Reasons for a decision allegedly surprising"), this implies that a party may not be taken by surprise by the reasons of a decision, referring to unknown grounds or evidence (R. 3/13; see also T. 1378/11). A purely subjective surprise, however, has no bearing on whether a party had an adequate opportunity to comment. "Grounds or evidence" within the meaning of Art. 113(1) EPC need not emanate from the board, it is sufficient if another party raises the objection (R. 2/08). If the reason given in a decision corresponds to an argument put forward by the other party (see also T. 405/94), the petitioner was aware of it and thus not taken by surprise (R. 4/08, R. 12/09 of 15 January 2010, R. 8/14) unless the board clearly indicated that it regarded those arguments as not convincing (R. 11/12).

In T. 996/09 the board held that the right to be heard was a fundamental guarantor for the parties that proceedings before the EPO would be conducted fairly and openly (with further reference to J. 20/85 and J. 3/90) and was intended to ensure that the parties to the proceedings were not taken by surprise by grounds mentioned in an adverse decision (following T. 669/90, T. 892/92, T. 594/00 and T. 343/01; see also T. 197/88, T. 220/93). In T. 435/07 the board held that the grounds on which a decision were based had to be communicated to the applicants in such a way that they were put in the position to defend

their rights. An objection against the grant of a patent had to be raised in such a way that the applicants were able to understand its factual basis and to react accordingly without first having to guess what the examining division might have had in mind.

Although parties may not be taken by surprise by the reasons for a decision, it is also settled case law of the Enlarged Board of Appeal under Art. 112a EPC that a board of appeal is not required to provide the parties in advance with all foreseeable arguments in favour of or against a request. In other words, parties are not entitled to advance indications of all reasons for a decision in detail (see chapter V.B.4.3.5 "No obligation to provide detailed reasons for a decision in advance"). In T 1634/10, T 2405/10 and T 1378/11 the boards explicitly applied this case law of the Enlarged Board of Appeal in relation to Art. 112a EPC to first instance proceedings.

In T 1065/16, lack of reproducibility as a ground for opposition had not been a subject of the opposition proceedings until the oral proceedings. It therefore amounted to a fresh ground for opposition. In its summons, the opposition division had expressly stated that only novelty and the inventive step of claim 1's subject-matter were to be examined. The introduction of a fresh ground for opposition thus came as a surprise. Having decided to admit the new ground of opposition into the oral proceedings, the opposition division should have given the patent proprietor the opportunity to present more detailed arguments on reproducibility. After all, the patent proprietor had no reason to expect that a decision would also be taken on the actual merits of the ground for opposition during the discussion on admissibility. As it had not been given sufficient opportunity to comment on this new ground for opposition, the opposition division had infringed Art. 113(1) EPC and thus committed a substantial procedural violation.

In T 2351/16 the board found that that the examining division had issued a decision of refusal after only one communication under Article 94(3) EPC as such did not constitute a violation of the appellant's right to be heard (see also chapter IV.B.2.5. "Refusal after a single communication"). However, the board considered the assertion that the appellant could not be surprised by an additional argument in support of the division's objection (mentioned for the first time in the decision) to be highly questionable. The refusal of an application based on a reasoning expressed for the first time in the decision constitutes a violation of the applicant's right to be heard and, therefore, a substantial procedural violation.

2.3.2 The meaning of "grounds or evidence"

"Grounds or evidence" under Art. 113(1) EPC are to be understood as meaning the essential legal and factual reasoning on which the decision is based (T 532/91, T 105/93, T 187/95, T 1154/04, T 305/14). In T 951/92 (OJ 1996, 53) the board ruled that the term "grounds or evidence" should not be narrowly interpreted and was to be understood as referring to the legal and factual reasons leading to refusal of the application, and not in the narrow sense of a requirement of the EPC (see also T 1423/15).

In T 556/15, the examining division's impugned decision was based entirely on a lack of compliance with Art. 123(2) EPC. The board's comparison of the objections under

Art. 123(2) EPC raised by the examining division in its two communications with those forming the grounds for its decision revealed that the latter had come as a surprise to the appellant. It had never had a chance to comment on those grounds, having only become aware of the new objections under Art. 123(2) EPC upon receiving the decision. In the board's view, the term "grounds or evidence" in Art. 113(1) EPC should not be interpreted narrowly but rather within the meaning of T 951/92. However, this case differed from that dealt with in T 951/92 in so far as the communications sent by the examining division to the appellant contained objections that, while detailed, did not concern any of the matters on which the decision was ultimately based. The appellant had thus been unaware that the features of the claims under discussion had violated Art. 123(2) EPC until it received the decision. The fact that the appellant had had several opportunities to amend the claims before the decision was irrelevant. What mattered was that the appellant had not had a chance to comment on the grounds for the decision.

In T 375/00 the appellant (opponent) considered that the technical problem mentioned by the opposition division in its decision was different from that discussed in the preceding proceedings. The board held that the appellant's right to be heard had not been violated, because the definition of the objective problem was part of the arguments, not part of the grounds as specified in Art. 113(1) EPC 1973.

In T 33/93 the board stated that the citation of a board of appeal decision for the first time in the decision under appeal was not a fresh ground or piece of evidence within the meaning of Art. 113(1) EPC 1973, but a mere repetition of arguments, since it only confirmed the position duly brought to the appellant's attention.

In T 1634/10 the examining division had issued a reasoned communication setting out its objections in the light of two prior art documents. The board held that the mere fact that the examining division had not agreed with the submission of the appellant did not amount to a breach of the right to be heard.

In T 2238/11 the appellant argued that the examining division had surprisingly concluded in the "Further Remarks" section in the decision under appeal that the claimed subject-matter lacked novelty and objected that it had not been heard on that aspect. However, the decision under appeal had been based on lack of inventive step, not on lack of novelty. The board held that a party's right to be heard was not violated if the party did not have the opportunity to comment on observations in an obiter dictum (T 726/10 and T 725/05). The "Further Remarks" section in the decision under appeal did not form part of the actual decision.

2.3.3 Opportunity to comment on evidence

In J 20/85 (OJ 1987, 102) the board pointed out that a decision on an issue of fact could only properly be made by the EPO after all the evidence on which such decision was to be based had been identified and communicated to the party concerned. In T 820/10 the examining division refused the application on the ground of lack of inventive step in view of documents that were cited for the very first time in the appealed decision itself. The board held that the decision therefore relied upon evidence on which the applicant had not

had an opportunity to present its comments. Furthermore, in J.3/90 (OJ 1991, 550) the Legal Board of Appeal held that where the EPO had examined the facts, Art. 113(1) EPC 1973 was not complied with unless the parties concerned had been fully informed about the enquiries made, and of the results, and had then been given sufficient opportunity to present their comments before any decision was issued (see also J.16/04).

In T.1401/16 the examining division based its conclusions concerning critical issues, at least in part, on two Wikipedia entries cited in the decision. However, this evidence was never referred to during the examination proceedings and both entries were mentioned for the very first time in the appealed decision itself. In consequence, the applicant had no opportunity to present its comments in that respect. This constituted a violation of the provisions of Art. 113(1) EPC.

See also chapter III.G.3.3. "Right to be heard".

2.3.4 Documents supplied by applicants but used against them

The right to be heard has not been observed if a decision to refuse an application is based essentially on documents which, though supplied by the applicant in support of his case, are used against him to produce an effect on which he has not had an opportunity to make observations (see T.18/81, OJ 1985, 166 and T.188/95).

2.3.5 Document cited containing information already known

In T.643/96 the examining division relied in its decision on a document for which it gave only incomplete bibliographic data. The board held that the examining division's failure to provide the applicant with a copy of the document did not amount to a substantial procedural violation (regarding the right to be heard) because the document added nothing to the case, and contained only information already known to the applicant.

2.3.6 Reliance on the International Preliminary Examination Report (IPER)

In T.587/02 the board held that if the only communication preceding the decision to refuse an application merely draws attention to an IPER, the requirements of Art. 113(1) EPC are met provided the IPER constitutes a reasoned statement as required by R. 51(3) EPC 1973, using language corresponding to that of the EPC; in the case of an inventive step objection this requires a logical chain of reasoning which can be understood and, if appropriate, answered by the applicant. In the case in hand, the IPER did not fulfil these requirements, and the board held that the applicant's right to be heard had been violated (see also T.1020/15).

In T.1065/99 the board stated that when an IPER drawn up by the EPO under the PCT was relied on by the examining division, such reliance should not be presented to applicants in such a manner as to suggest that the examining division had not given objective consideration to the patentability requirements of the EPC. In this case, the IPER had been adopted by the examining division as the only basis for its opinion that the application did not meet the requirements of the EPC. The board came to the conclusion

that there were three objections which were only obliquely touched upon in the IPER, and thus in the communication under R. 51(2) EPC 1973. Therefore, the party had had no opportunity to contest those objections.

2.3.7 Change of provisional opinion

In T 68/94 the appellant submitted that the opposition division had violated Art. 113 EPC 1973 by changing its provisional opinion after the oral proceedings without giving the appellants an opportunity to comment on the grounds on which the contested decision was based. The board pointed out that provisional opinions were never binding. The purpose of oral proceedings was to summarise and discuss the parties' arguments. All arguments in the case had been known to both parties.

In T 1824/15, the board held that the members of an examining division were free to change their minds at any point in the procedure, including during oral proceedings, as long as the requirements of Art. 113(1) EPC were fulfilled.

2.3.8 Statement of grounds of appeal not received by respondent

For the EPO's failure to deliver the opponent's statement of grounds of appeal to the patentee (respondent) see chapter V.B.4.3.19 "Successful petitions under Article 112a(2)(c) EPC".

2.4. Consideration of the parties' arguments, submissions and evidence

2.4.1 General principles

The right to be heard under Art. 113(1) EPC requires that those involved be given an opportunity not only to present comments (on the facts and considerations pertinent to the decision) but also to have those comments considered, that is, reviewed with respect to their relevance for the decision on the matter (see, with regard to Art. 112a EPC, chapter V.B.4.3.10 "Consideration of the parties' arguments in the written decision" and, with regard to R. 111(2) EPC, chapter III.K.3.4 "Reasons for the decision"). However, it is not necessary to consider each and every argument of the parties in detail in a decision. The boards may also refute arguments implicitly, and may disregard irrelevant arguments (R 5/15).

2.4.2 Decision must demonstrably show that arguments were heard and considered

The deciding department must demonstrably hear and consider the comments (T 206/10, with further reference to T 763/04, T 246/08; see also T 1709/06, T 645/11). Merely repeating the parties' submissions is not enough; rather, it has to be clear from the reasons that the substance of their core arguments has been addressed in arriving at the decision (T 2352/13).

A decision which fails to take into account the arguments submitted by a party and which is based on a ground on which the party had had no opportunity to present its comments,

contravenes Art. 113(1) EPC and constitutes a substantial procedural violation (see J.7/82, OJ 1982, 391; T.1039/00, T.778/98, T.1312/10). When a decision refusing an application is based on several grounds supported by respective arguments and evidence, it is of fundamental importance that the decision as a whole meets the requirements of Art. 113(1) EPC (T.1034/11).

In T.763/04 the board held that Art. 113(1) EPC is contravened if facts and arguments which, according to the appellant, are clearly central to his case and which may speak against the decision taken, are completely disregarded in that decision. See also T.1898/11, T.2227/09 and T.1206/12. According to T.740/93, in addition to the logical chain of facts and reasons, the decision should include some motivation on the crucial points of dispute. In T.1557/07 the board held that the examining division had commented on the crucial points of dispute, giving the applicants a fair idea of why their submissions were not considered convincing.

In T.238/94 the board considered that, although the opposition division's decision indeed contained no direct reference to the appellants' submissions concerning lack of inventive step, the opposition division had considered in its decision the disclosures of all the documents cited by the appellants and respondents, and also the possible combinations of their teachings. Thus, in the board's view, the appellants' submissions had actually been taken into account, albeit indirectly, in the process of arriving at the contested decision (see also T.1004/96).

In T.1843/11 the appellant alleged that a substantial procedural violation had occurred because it had raised an argument concerning sufficiency of disclosure that had not been addressed in the decision of the opposition division. The board recalled that, according to R.111(2) EPC, decisions of the EPO which are open to appeal must be reasoned. Although the opposition division was not required to address each and every argument of a party (see in this chapter III.B.2.4.3), the important question was whether the party concerned could objectively understand whether the decision was justified or not. The decision should contain at least some reasoning on crucial points of dispute, in order to give the party concerned a fair idea of why its submissions were not considered convincing and to enable it to base its grounds of appeal on relevant issues (see T.70/02). According to the board, the fact that no reasons were given in the decision of the opposition division why the appellant's argument was not an answer to the crucial objection under Art. 83 EPC amounted to a substantial procedural violation. It was not sufficient for the requirements of Art. 113(1) EPC to be met that the appellant had been given the opportunity to (and in fact had) put forward the argument. What was additionally important was that the opposition division demonstrably heard and considered this argument (see T.763/04). As this condition had not been met, a substantial procedural violation had occurred.

In the case at issue in T.1411/07, the patent proprietor had challenged the admissibility of the opposition on the ground of lack of substantiation, but the opposition division had found it admissible without stating any reasons. The board considered the opposition division's failure to make any reference to the patent proprietor's submissions a breach of R.68(2) EPC 1973 (R.111(2) EPC) and a substantial procedural violation.

In **T.655/13** the board held that the examining division would need to provide the translation of at least the referenced larger section of document D1 on which it based its reasoning, or identify the relevant passage as clearly as possible, to enable the appellants (and if necessary the board) to understand and verify whether the examining division had taken their arguments into account, thereby respecting their right to be heard.

In **T.1385/16** there was no discussion in the decision under appeal of the appellant's submissions made in letters of 12 December 2012 and 17 August 2012 regarding application of the Guidelines H-V, 3.2.1 and H-V, 3.1 at that time, which it regarded as being relevant to the question of assessing whether the amendment constituted an unallowable intermediate generalisation. Indeed the board held that there did not appear to have been any adequate discussion of these submissions at any point during the examination procedure. Since the examining division had failed to address fundamental submissions made by the appellant in the decision under appeal, the board found that a substantial procedural violation had occurred.

2.4.3 No obligation to address each and every argument

Provided that the reasons given enable the parties concerned to understand whether the decision was justified or not, the deciding organ is under no obligation to address each and every argument presented by the party concerned (see chapter **V.B.4.3.10** "Consideration of the parties' arguments in the written decision"; see also **T.1898/11** and **T.1557/07** quoted in **T.1969/07**, **T.698/10**, **T.1199/10** and **T.1961/13**). Moreover, a party has no absolute right to be heard separately on each and every one of its auxiliary requests (see also chapter **V.B.4.3.12** "No right to be heard separately on all requests").

2.4.4 Failure to consider submissions made after a communication

In **T.1709/06** it was held that, in accordance with established case law (see in this chapter **III.B.2.4.2**), not only must an opportunity to present comments be given, but these comments must actually be taken into account. The decision "on the state of the file" expressly stated that the applicant had filed no submissions after the final communication, which was incorrect. The board held that, because the examining division had ignored potentially significant arguments presented in a reply following a communication containing a new objection, the applicant had been denied its right to comment on all the grounds for refusing the application. The applicant's right to be heard enshrined in **Art.113(1)EPC** had therefore been infringed.

The board in **T.1997/08** held that for an examining division not to violate an applicant's right to be heard, its decision had to actually address the arguments put forward by the applicant in its reply to the communication. It may be assumed that the right to be heard has been contravened if the reasons given for the examining division's decision merely repeat the reasons given for the communication issued before the said reply (see also **T.116/12**).

In **T.921/94** the board held that the appellant's bona fide submissions and the technical information provided in reply to a communication substantially changed the points at issue,

and that the examining division had an obligation under Art. 96(2) and 113(1) EPC 1973 to inform the appellant of the objections arising in the new situation and to invite it to file further observations before refusing the application. A decision which only comprises a mere formal acknowledgement of the applicant's submissions, without dealing with them in substance, contravenes the general principle of good faith and fair proceedings that reasoned decisions contain at least some reasoning on the crucial points of dispute in order to give the party concerned a fair idea of why his submissions were not considered convincing (see also T 1154/04).

In T 296/96 the applicant had submitted unconvincing arguments in his reply to the first and only communication. The examining division refused the application on the basis of the objections mentioned in the first communication, and did not issue a second one. Since, however, the main arguments for refusing the application were a mere repetition of those mentioned in the first communication, the contested decision was based on grounds on which the applicant had had an opportunity to present his comments. Consequently, Art. 113(1) EPC 1973 was not contravened (see also T 2316/10).

2.4.5 Failure to consider evidence

According to T 1536/08 it is well-established in the jurisprudence of the boards of appeal (see inter alia J 7/82, T 94/84 and T 135/96) that the right to be heard enshrined in Art. 113(1) EPC also guarantees the right to have relevant grounds that could potentially influence the outcome taken into account in the written decision. A decision rejecting the opposition must therefore take into account the ground(s) for opposition raised as well as facts and evidence put forward in support of these grounds, including the cited prior art documents. Failure to consider evidence will normally constitute a substantial procedural violation of this fundamental right as it deprives the party of the right to have its case fully heard (see also T 1098/07 below). In the case at issue, the opposition division had completely ignored the unambiguous offer by the opponent in the notice of opposition to provide the original printed versions of crucial prior art documents. The failure to consider this offer constituted a violation of the right to be heard.

In T 1110/03 (OJ 2005, 302) the board held that Art. 117(1) EPC and Art. 113(1) EPC enshrined a basic procedural right generally recognised in the contracting states, i.e. the right to give evidence in appropriate form, specifically by the production of documents (Art. 117(1)(c) EPC), and the right to have that evidence heard (see also T 2294/12).

In T 1098/07 the board stated that failure to consider evidence will normally constitute a substantial procedural violation in that it deprives a party of basic rights enshrined in Art. 117(1) and Art. 113(1) EPC. In the board's opinion, certain factors may nevertheless mitigate the severity of the violation. Thus, whether or not a failure of the decision to expressly mention material offered by a party in support of its case constitutes a substantial procedural violation will depend on the (prima facie) significance and evidential value of such material. The questions to be asked are: what facts is it intended to prove, how relevant is it to these facts and how likely is it that it will prove them? In the case at issue, the failure to consider the evidence was a pardonable error that had not deprived the appellant of any fundamental rights.

In T.2294/12 one of the appellants' objections was that the proceedings before the examining division had been fundamentally flawed because the two sets of comparative tests that they had submitted during the written phase had been disregarded. The board noted that the decision under appeal gave no reason why the division had found the first set irrelevant and did not even mention the second, which had been submitted in response to the division's objections of a lack of novelty over a document D3. The board stated it was well established in the Boards' case law that the right to be heard also guaranteed the right to have relevant grounds that might influence the outcome taken into account in the written decision; moreover parties had the right both to give evidence in an appropriate form and to have it heard (see T.1110/03 above) unless that evidence had been expressly excluded. The board held that the examining division had denied the appellants their right to be heard.

In T.21/09 the board held that the opposition division had either (i) disregarded the experimental evidence submitted by the appellant as late-filed, or (ii) considered the evidence, but failed to give proper reasons why it did not support the alleged technical effects. In the first case, the patent proprietor had not been heard on the admission of the evidence, and, more importantly, the decision was absolutely silent about it. In the second case, the decision under appeal suffered from a severe deficiency in the reasons given by the opposition division for the adverse findings on inventive step. In either case, the decision could not be regarded as being in conformity with R.111(2) EPC.

In T.2415/09 the appellant (patent proprietor) argued that new documents and experiments submitted by the respondent had only been transmitted to the appellant six weeks before the oral proceedings before the opposition division. The board said it could not comment on the exact period needed to conduct comparative experiments. Even if the periods specified in R.132(2) EPC did not apply in the case in point (R.116(1) EPC), they showed that a party could not be required to conduct comparative experiments in a period as short as six weeks. The board concluded that the opposition division had failed to respect the appellant's right to be heard.

In T.94/84 (OJ 1986, 337) the board held the right to be heard guarantees that grounds put forward are taken into consideration, and it is contravened if a translation, subsequently filed in an official language, of a Japanese document cited in due time is disallowed.

In T.2541/11 the appellant (opponent) submitted that the non-admission of a document without a full discussion as to its relevance violated its right to be heard. The board stated that a right to present all arguments as if the document had been admitted, instead of arguments as to why it should be admitted, amounted to a de facto admittance of the document, implying, contrary to Art.114(2) EPC, that the board had no discretion to disregard a late-filed document. According to the board, the right to respond is not absolute but must be balanced inter alia against the need for procedural economy and due diligence that underpins Art.114(2) EPC, which affords the board discretionary power to disregard evidence not submitted in due time.

See also chapter III.G.3.3. "Right to be heard".

2.4.6 Mere reference to jurisprudence

In T 1205/12 the board stated that according to established jurisprudence of the boards of appeal Art. 113(1) EPC is contravened where facts and arguments, which from the appellant's submissions are clearly central to his case are completely disregarded in the decision. The board held that the applicant's arguments had not been dealt with in the impugned decision and stated that the mere reference to jurisprudence of the boards of appeal does not, by itself, constitute or replace an argument in a first instance decision. If a deciding body, in a decision, wants to rely on an argument put forward in a decision of the boards it is insufficient merely to refer to it or to recite it. The deciding body must also make clear that it adopts the argument and explain why, in what respect and to what extent this argument applies to the case at hand (see also T 1206/12).

2.5. The right to be heard and the timing of decisions

2.5.1 Decision could not be expected

In T 849/03 the board held that a decision should not catch the parties unawares. In the examination procedure the right to be heard is therefore violated not only in the event of failure to inform the applicant beforehand of the reasons forming the basis of a rejection but also if, at the time the decision is issued, the applicant had no reason to expect such a decision (see also T 1022/98 and chapter V.B.4.3.9 "Timing of a decision allegedly surprising").

In T 611/01 the board decided that a substantial procedural violation was occasioned by the examining division holding out to the appellants the prospect of a further opportunity to file arguments before any decision would be issued, and then issuing the decision without providing for that opportunity (regarding a false impression raised concerning amended claims, see also T 309/94).

In T 966/02 the board stated that it had been clear that the appellant (patent proprietor) had regarded both filed notices of opposition as inadmissible and had thus felt that there was no sense in commenting on the facts until the situation had been clarified. The appellant could not have foreseen that the opposition division would give a final decision without first clarifying the procedural situation, and it came as a complete surprise to it that it did so.

In T 922/02 (ex parte) the board stated that the provisions of Art. 113(1) EPC 1973 were only complied with in a case where the decision was taken after remittal for further prosecution, if the notification and invitation was made after the remittal, typically by announcing the resumption of the proceedings, setting out the objections, if any, and asking the appellant whether or not he wished, within a fixed period of time, to present his comments or modify his request(s). Otherwise any final decision would come as a surprise to the appellant, which was contrary to the principle of good faith and fair hearing established by Art. 113(1) EPC 1973. The board followed in this respect the case law developed in T 892/92 (OJ 1994, 664) and T 120/96 for opposition proceedings, which

was equally applicable to examination proceedings, because the right to be heard was an essential procedural principle governing both procedures.

In T 281/03 of 17 May 2006 the issue of inventive step was not discussed at the oral proceedings, and the opposition division, after deliberating and announcing its decision on novelty, immediately announced the decision to reject the oppositions. The board held that, in order to guarantee the right to be heard, there should have been an explicit step, recorded in the minutes, giving the opponent the opportunity to comment on inventive step before the final deliberation, or alternatively an opportunity after the deliberation to comment on the opposition division's conclusion.

In T 451/06 the board distinguished the situation at hand from that in decision T 281/03. In the case underlying T 281/03, the opposition division had failed to give the opponent an opportunity to comment on lack of inventive step, thereby depriving the opponent of any possibility of substantiating a ground of opposition (see G 1/95). By contrast, in the case in hand, the opponent had been given the opportunity to substantiate the ground of opposition of lack of inventive step. The chairman's invitation to present all the objections in respect of inventive step had in effect been an invitation to the opponent to present both its "main and auxiliary requests". After the initial statement of the chairman that the issue to be discussed was lack of inventive step, the substantiation of the ground of opposition was exclusively the responsibility of the opponent.

In R 3/10 the Enlarged Board of Appeal allowed the petition for review. The petitioner had had no opportunity to comment on the inventive step of its main request before the chairman informed the parties that the board would decide on "patentability" of the main request. The board then held that the main request was novel but lacked an inventive step. According to the Enlarged Board of Appeal, the term "patentability" covered a variety of potential objections and the chairman could not have meant to address all of them. The petitioner had had no reason to assume that the board's decision would address more than what had been previously discussed, i.e. novelty (see also chapter V.B.4.3.19 "Successful petitions under Article 112a(2)(c) EPC").

2.5.2 Issuing of decision before expiry of time limit to comment

In T 663/99 the board decided that the patent proprietor's right to be heard was violated if the time limit fixed under R 57(1) EPC 1973 for presenting comments on the opposition had not expired by the date of handing over a revocation decision to the EPO's internal postal service (see also T 804/94).

In T 1081/02 the board of appeal decided that the principle of the right to be heard had been violated, since the opposition division, after inviting the patent proprietor to file the documents considered necessary to maintain the patent within two months, did not wait until this time limit had expired but issued an interlocutory decision prior to its expiry.

In T 685/98 (OJ 1999, 346), the board held that the phrase "fails to reply in due time to any invitation under ... paragraph 2" in Art. 96(3) EPC 1973 had to be construed in the light of the purpose of the invitation pursuant to Art. 96(2) EPC 1973 and R. 51(2) EPC 1973,

which was to afford the applicant an opportunity to exercise his right to present comments in accordance with Art. 113(1) EPC 1973. Hence, a letter from the applicant which neither exercised nor waived that right was not a reply for the purposes of Art. 96(3) EPC 1973. In the case in hand, the examining division believed erroneously that the applicant, by making a simple procedural request, had forfeited his right to present comments during the remainder of the term set for reply. Thus the precipitate refusal, while there were still some two months of the term for reply unexpired, did contravene Art. 113(1) EPC 1973.

2.5.3 Immediate refusal after communication

It is well-established in the jurisprudence of the boards of appeal that an examining division does not exceed its discretionary power by immediately refusing an application after only a single communication. However, the decision must comply with Art. 113(1) EPC, i.e. must be based on grounds on which the applicant has had an opportunity to present comments (see T 201/98 and T 1002/03; see also T 84/82, OJ 1983, 451 and T 300/89, OJ 1991, 480; see chapter IV.B.2.5. "Refusal after a single communication"). If the factual basis is not sufficiently given in the single communication so that the applicant has to speculate about the examining division's assessment and thus is not put in the position to properly defend its rights, the requirements of Art. 113(1) EPC cannot be considered to be met; coming to a final decision after such a single deficient communication results therefore in a substantial procedural violation (T 435/07).

In T 305/14 the board stated that only if a preceding communication pursuant to Art. 94(3) EPC sets out the essential legal and factual reasoning to support a finding that a requirement of the EPC has not been met, can a decision based on such a finding be issued without contravening Art. 113(1) EPC. In the case at hand, the board held that the decisive statement had been put forward in the communication in an abstract way only, without the necessary logical chain between the given statement and the particular technical facts of the case. Because the appellant learnt about the essential reasoning for the first time in the impugned decision, it did not have an opportunity to present its comments with respect to that reasoning.

2.5.4 Invitation to oral proceedings at short notice

In T 166/04 the board held that the late introduction of additional prior art documents together with an invitation to oral proceedings was not necessarily improper, even if they formed part of a critical argumentation. The appellant objected that this was a gross procedural violation and argued that the examining division should have issued another communication to safeguard the applicant's right to be heard. The board considered that the time frame of two and a half months for the applicant to respond was in conformity with R. 71(1) EPC 1973 and was not unduly short. Further, apart from the non-extendable time limit, the appellant had had an opportunity to respond to the summons in writing as if he had responded to a communication under Art. 96(2) EPC 1973, which he had actually done by submitting amendments and further arguments. In addition, the board pointed out that the applicant had decided not to participate in the first-instance oral proceedings during the course of which he could have made further submissions.

2.6. The right to be heard in oral proceedings

The right to oral proceedings regulated by Art. 116(1) EPC forms a substantial part of the right to be heard granted by Art. 113(1) EPC (T 209/88, T 862/98, T 1050/09). The right to be heard in oral proceedings subsists so long as proceedings are pending before the EPO (T 598/88, T 556/95, T 114/09).

The right to present comments enshrined in Art. 113(1) EPC does not need to be exercised in writing but may be satisfied by way of oral proceedings (T 1237/07). This does not mean, however, that it is for the boards to ensure, of their own motion, that all points raised at some point in the proceedings are discussed at the oral proceedings. Rather, it is for the parties to address any point they consider relevant and fear may be overlooked and to insist, if necessary by way of a formal request, that it be discussed (R 17/11). This also applies in oral proceedings before the opposition division (T 7/12).

In T 2232/11 the board held that the mere announcement of a further submission based on additional documents, at the opening of the discussion on an invention's reproducibility, was insufficient to oblige the examining division to follow this announcement up ex officio later on in the oral proceedings. The applicant was therefore responsible for notifying the examining division, where necessary via a formal request, of its intention to make further submissions on the topic. Given the course of the proceedings, the applicant ought to have expected that the examining division might reach a final decision after interrupting the proceedings to deliberate.

Conversely, Art. 113(1) EPC cannot be interpreted in a way that a party's right to be heard is already satisfied if a party, having requested oral proceedings according to Art. 116 EPC, has had the opportunity to argue in writing. If this interpretation of Art. 113(1) EPC were to be followed, the parties' right to oral proceedings under Art. 116 EPC would be redundant, with the unacceptable consequence that an opposition division or a board of appeal would be entitled, with regard to a controversial issue discussed during written procedure, to give a decision right at the beginning of oral proceedings without hearing the parties (T 1077/06).

Non-compliance with a request for oral proceedings deprives the party of an important opportunity for presenting its case in the manner it wishes and using the possibilities open to him under the EPC. By virtue of its request for oral proceedings, the party can rely on such proceedings being appointed before an adverse decision is issued, and therefore has no reason to submit further arguments in writing (see T 209/88, T 1050/09; and also chapter III.C.2. "Right to oral proceedings").

Conducting oral proceedings effectively and efficiently, although subject to the discretionary power of the chairman, must nevertheless guarantee that the fundamental procedural rights of each party in adversarial proceedings, i.e. the right to fair and equal treatment, including the right to present comments in oral proceedings (Art. 113(1) and 116 EPC) are respected (T 1027/13; see also chapter IV.C.6.1. "Principle of equal treatment").

There is no infringement of the right to be heard where an examining division refuses to minute a party's submissions during oral proceedings (T.1055/05).

A party's right to be heard under Art. 113(1) EPC does not imply a separate right of the party's representative to be heard and therefore does not imply a right to have oral proceedings before the EPO held by video conference (T.2068/14; see also chapter III.C.7.3. "Oral proceedings held by video conference").

2.6.1 Introduction of a new claim or relevant document

In a case where an opposition division or a board of appeal feels bound by Art. 114(1) EPC to examine new facts or evidence submitted for the first time during oral proceedings, it must, in accordance with Art. 113(1) EPC, give the other parties the opportunity to comment before issuing a reasoned decision based on such facts or evidence (G 4/92, OJ 1994, 149; see also T.484/90, OJ 1993, 448; with regard to late submissions see T.330/88, T.356/94 and chapter IV.C.4. "Late submission"). The same principle has also been applied to decisions of examining divisions (see e.g. T.376/98). The applicant does not have a right in principle to continuation in writing; the party's right to be heard under Art. 113(1) EPC is also observed if the applicant is given an adequate amount of time to study the document and present comments. How much time is sufficient depends on the nature of the newly introduced document and the preceding procedure (T.2434/09).

a) Cases in which Article 113(1) EPC was violated in relation to the introduction of new claims or relevant documents

In T.951/97 (OJ 1998, 440), although document D4 had been mentioned in the European search report, it had not been cited at any stage in the examination procedure prior to the oral proceedings. The board found that the half an hour adjournment of the oral proceedings had been too short a period for an adequate analysis of the complex text of D4. As D4 was essential to the finding of the examining division in relation to inventive step, the decision was based on evidence on which the applicants had not had a sufficient opportunity to present their comments as required by Art. 113(1) EPC 1973 (see also T.492/03).

In T.783/89 the opposition division had proposed a new version of the main claim at the start of the oral proceedings, giving the opponents ten minutes to consider it. The board ruled that this had taken the opponents by surprise, and that the time given had not been sufficient to study the allowability of the amendments.

In T.2235/12 the examining division had introduced, two days before the oral proceedings, two additional documents and a new objection into the procedure. The appellant's request for a postponement of the oral proceedings was rejected, and the appellant did not attend the oral proceedings. The board held that the new objection was not related to the points indicated in the summons and that the appellant should have been given an adequate opportunity to react to the new objection. Attending the oral proceedings would not have changed the fact that the timeframe was too short for the representative to get instructions from the client and to prepare for oral proceedings with a new focus. The board concluded

that rejecting the appellant's request for a postponement of the oral proceedings infringed the appellant's right to be heard.

In T.75/10 the board saw no reason to overturn the opposition division's admission of late-filed documents that appeared highly relevant for novelty. However, the board considered that the opposition division should have granted the patentee's request for postponement of the oral proceedings, after deciding to admit these. The board stated that there was an essential difference between a prima facie assessment of the possible relevance and publication date of a late-filed document for deciding upon its admission into the proceedings and the full in-depth assessment of novelty vis-à-vis such a document, which required determining whether the document was made available to the public before the effective filing date. In the case at hand, the documents were generated from an archive different from the databases commonly used for a prior-art search. Therefore, the difficulties encountered by the patentee at the oral proceedings when trying to verify the origins of the late-filed documents were plausible.

In T.763/15 the board held that the appellant's right to be heard had been violated by the opposition division – it could not see any indication that the appellant had been allowed to argue during the oral proceedings on the issue of admissibility of auxiliary request 2. In the opposition proceedings the chairman, after commenting on the amendment made to claim 1 of auxiliary request 2, immediately announced "that AUX2 is not admitted in the proceedings". A decision taken and pronounced by the opposition division cannot be challenged any more in the same proceedings. Therefore, the board considered it to be irrelevant that "The Patentee did not react on this decision not to admit AUX2 in the proceedings", as recited in the minutes.

b) Cases in which Article 113(1) EPC was not violated even though new claims or relevant documents were introduced

In T.484/89 the board held that the opposition division was empowered under Art. 114(1) EPC 1973 to take account of and refer to all relevant documents cited. In the case in question the opposition division had considered it necessary to refer to a document during the oral proceedings. In such cases the parties should, at their request, be granted an adjournment or else new oral proceedings should be appointed. Since no such request was made, according to the decision and the record of the oral proceedings, Art. 113(1) EPC 1973 had not been breached.

In T.608/08 the board agreed in principle with the appellant (opponent) that when the patent proprietor submits new claims an opponent must be afforded an opportunity to familiarise itself with the new situation, which must at least involve a sufficiently long interruption of the oral proceedings. However, that applies only to requests incorporating new content. In the case at issue, the auxiliary request consisted of a combination of features from sub-claims belonging to the main request. The technical features of the sub-claims were straightforward and did not put the subject-matter of the main request in a new and more complex technical context. Consequently, the admission of the auxiliary request did not entail a surprisingly new procedural situation requiring the opposition

division to interrupt the oral proceedings (in contrast to **T. 783/89**, in which a completely reformulated text of the claim introduced a new feature; see above).

In **T. 1031/12** the appellant claimed that a new document had unexpectedly been mentioned for the first time at the end of the oral proceedings before the examining division, without its being given an opportunity to present counter-arguments. The board noted that the representative had been afforded the time he himself had identified as necessary for a reply. Therefore he had had not only the opportunity but also sufficient time to comment.

In **T. 376/98** the examining division had referred to document D4 for the first time during the oral proceedings, and had stayed the oral proceedings to give the applicant time for consideration. When the oral proceedings were resumed, the appellant requested a decision based on the documents on file. Regarding the introduction of D4 at the oral proceedings, the board noted that no procedural limitations were placed upon the examining division to cite relevant documents during any stage of the examination procedure, as long as the applicant was given a fair chance to comment on the objections raised before a final decision was taken (see **T. 1198/97**). In the board's opinion, the appellant's request for a decision could only be taken to mean that the appellant was not interested in a further debate about the relevance of D4.

In **T. 566/91** the opposition division based its decision to revoke the patent on a version of a citation which was more complete than the version which had been cited by the opponents when filing the opposition. The decision of the department of first instance was thus based, albeit inadvertently, on evidence on which the parties had not had the opportunity to comment. In order to comply with **Art. 113 EPC 1973** in the appeal proceedings, the board offered the parties a half-hour suspension of the oral proceedings to enable them to study the fuller version of the document with the help of the interpreters.

c) Cases where no new claims or relevant documents were introduced

In **T. 195/84** (OJ 1986, 121) the appellant (patentee) objected at the oral proceedings that new grounds on inventive step were presented to which he had not had an opportunity to reply. The board did not share this opinion as the appellant had been aware that such prior art existed, and had thus had sufficient time to consider it in full. Furthermore, he had not requested any additional time and had not asked for an adjournment.

In **T. 327/92** the opposition division, at oral proceedings, had relied on a document as closest prior art against an amended main claim, which had been cited in the opposition against a dependent claim only. The board did not consider this a substantial procedural violation, as the patentee was dealing with a document which had always been part of the opposition, and could further examine this document at the oral proceedings.

2.6.2 Introduction of new arguments

In **T. 248/92** the examining division had based its decision on arguments submitted for the first time during oral proceedings. The board held that the examining division's decision

had not been taken contrary to Art. 113(1) EPC 1973. Although one of the purposes of oral proceedings was to settle as far as possible all outstanding questions relevant to a decision, they did not have a constraining effect in the sense of requiring an immediate decision to be taken at the end of those proceedings. If the appellant had felt the need for further reflection, he could have asked for the oral proceedings to be adjourned or for the proceedings to be continued in writing so that he could study carefully the newly introduced arguments, which had obviously been crucial to the decision.

In T. 623/12 the opposition division had found, on the basis of an argument first submitted by the opponent during the oral proceedings, that several auxiliary requests did not comply with Art. 123(2) EPC. The opposition division gave the patent proprietor only one opportunity to file a new claim, based on one of the previous auxiliary requests, and warned that "other requests may suffer from other deficiencies under Art. 123(2) EPC". It then decided that the new auxiliary request still did not comply with Art. 123(2) EPC. According to the board, the opposition division's warning did not provide the patentee with a basis for an informed choice since neither the objections nor the requests affected by them were specified. By acting in this manner, the opposition division did not exercise its discretion in respect of the admissibility of the patentee's late-filed request but arbitrarily decided not to allow the request. This arbitrary decision deprived the patent proprietor of a proper opportunity to comment on the admissibility of its further request and to reply to the objections of the opposing party.

In T. 1014/10 the appellant (patent proprietor) argued that during the opposition proceedings it had been given no opportunity to study the opponent's submissions because they were delivered to its office only on the day of the oral proceedings. The board observed that it was the duty of the parties – and of the board – to check the content of the electronic file in order to make sure that no submission had been added in the days before the oral proceedings. Moreover, the proprietor could have requested an interruption of the oral proceedings to study the submissions, or even asked the opposition division not to admit them into the proceedings. As shown by the minutes, the proprietor did not make use of these procedural options. Under these circumstances, the late-filed submissions, which furthermore did not contain any new facts, were to be put on the same footing as new arguments which might have been put forward and discussed anyway during the oral proceedings. The board did not see any violation of Art. 113 EPC.

2.6.3 Introduction of a new ground of opposition by the opposition division

In T. 515/05 the appellant had based its opposition only on the grounds of Art. 100(a) EPC 1973. In the summons to the oral proceedings the opposition division itself introduced a further ground for opposition under Art. 100(b) EPC 1973. At the beginning of the oral proceedings the chairman of the opposition division stated that no discussion of the ground of opposition under Art. 100(b) EPC 1973 would take place because it had not been sufficiently substantiated by the opponent. Denying the appellant the opportunity to comment on this ground, albeit introduced by the opposition division itself, was considered a substantial procedural violation. The fact that the appellant did not file written arguments in response to the summons to attend the oral proceedings did not deprive it

of its right to be heard. The appellant was entitled to expect that it would still have an opportunity to comment on this new ground during the oral proceedings.

2.6.4 Hearing witnesses

In T 142/97 the board held that the opposition division had violated the opponent's right to be heard under Art. 113(1) EPC 1973 by not hearing the witness offered in connection with a prior use that had been adequately substantiated in the notice of opposition. See also T 959/00 in which the board held that the opposition division's failure to hear the witness, and the absence in the decision under appeal of any reference to a reason why it had not been necessary to hear the witness, amounted to a fundamental procedural violation of the right to be heard.

In T 269/00 the board held that the case before it differed from T 142/97 because the ground of prior use was not adequately substantiated during the opposition period, but completed piecemeal during the opposition proceedings. The board concluded that not hearing the witness did not amount to a substantial procedural violation.

In T 474/04 (OJ 2006, 129), the board held that if assertions made in an unsworn witness declaration remained contested, a request to hear the witness had to be granted before these assertions were made the basis of a decision against the contesting party.

In T 909/03 the hearing of a witness took place in the morning and the oral proceedings continued in the afternoon. The board held that it was not necessary for a party to be given a copy of the minuted testimony before commenting on that testimony. During the oral proceedings the party had been given sufficient opportunity to comment. No substantial procedural violation had thus occurred.

In T 716/06 the board confirmed that where oral evidence of a witness was requested by a party the competent department should grant this request only if it considered this oral evidence necessary to clarify matters that were decisive for the decision to be taken. However, where an opponent requested that a witness be heard on an alleged public prior use and on the disclosure of a certain feature by this prior use, the competent department as a rule had to grant this request before deciding that the alleged public prior use was neither established nor constituted a novelty-destroying state of the art. See also T 1100/07.

2.6.5 Oral submissions of an accompanying person

For the denial of a request for an accompanying person to present oral submissions see chapter V.B.4.3.18 "Further examples of unsuccessful petitions". See also chapter III.V.5. "Oral submissions by an accompanying person".

2.7. The right to be heard in case of the non-attendance of oral proceedings

The proceedings may continue without the duly summoned but non-attending party (R. 115(2) EPC, R. 71(2) EPC 1973). The case law of the boards demonstrates, however, that the non-attending party's right to be heard under Art. 113 EPC must not be ignored.

2.7.1 Facts and evidence put forward for the first time during oral proceedings in inter partes cases – G 4/92

In G 4/92 (OJ 1994, 149), which explicitly relates to inter partes proceedings only, the Enlarged Board held that, in view of the right to present comments, a decision against a party who had been duly summoned but who failed to appear at oral proceedings could not be based on facts put forward for the first time during those oral proceedings. Evidence put forward for the first time during oral proceedings could not be considered unless it had been previously notified and it merely supported the assertions of the party which had submitted it. New arguments, on the other hand, did not constitute new grounds or evidence, but were reasons based on the facts and evidence already put forward. As regards new arguments, the requirements of Art. 113(1) EPC could thus be satisfied even if a party who chose not to appear did not have the opportunity to comment on them during oral proceedings.

According to Art. 15(3) RPBA 2007 (Art. 11(3) RPBA 2003), "the Board shall not be obliged to delay any step in the proceedings, including its decision, by reason only of the absence at the oral proceedings of any party duly summoned who may then be treated as relying on its written case." The preparatory documents to this Article state that this provision does not contradict the principle of the right to be heard pursuant to Art. 113(1) EPC since that Article only affords the opportunity to be heard and, by absenting itself from the oral proceedings, a party gives up that opportunity (CA/133/02 dated 12 November 2002). This RPBA provision superseded the findings of G 4/92 with regard to the non-attendance at the oral proceedings before the boards (T. 706/00). To the extent that G 4/92 supports the general admissibility of new arguments in appeal proceedings, it was also modified by the amendments to the RPBA introduced with effect from 1 May 2003 which make the introduction of new arguments subject to the discretion of the boards (T. 1621/09, summarising previous case law). G 4/92 still applies for the departments of first instance (see Guidelines E-III, 8.3.3.2 – November 2018 version). With regard to proceedings before the examining divisions, see also the notice published in OJ 2008, 471.

2.7.2 Non-attendance at oral proceedings before the boards – case law on G 4/92

In T. 341/92 (OJ 1995, 373) the board held that it was possible to base a decision on a ground discussed for the first time during oral proceedings, at least if the stage reached in the case was such that the absent – albeit duly summoned – patent proprietors could have expected the question to be discussed and were aware of the actual basis on which it would be judged. The board did not consider itself prevented by reasons of procedural law from rendering a decision on the basis of Art. 123(3) EPC 1973, on an issue brought up by the board for the first time at the oral proceedings. It argued that the situation differed

from G 4/92 in that the extension of the protection conferred, to which objection had been made, arose solely from a comparison of the wordings of the claims, and therefore not from facts that had only been introduced during oral proceedings.

In T 802/12 the board likewise dismissed the appeal on the basis of Art. 123(3) EPC, which had been discussed for the first time at the oral proceedings. The board referred to T 341/92 and found that the appellant could have expected the amendments it had made to be examined at the oral proceedings as to their conformity with the requirements of the EPC (G 9/91, OJ 1993, 408). A party duly summoned to oral proceedings could not rely on the proceedings being continued in writing or the case being remitted to the department of first instance simply because he had not attended the oral proceedings (Art. 15(3) and (6) RPBA; see in this chapter III.B.2.7.3 "Non-attendance at oral proceedings before the boards – Article 15(3) RPBA 2007").

In T 133/92 the board concluded that considering and deciding in substance on the maintenance of the patent on the basis of claims as amended during oral proceedings in the absence of the appellants (opponents) did not conflict with the opinion of the Enlarged Board of Appeal in G 4/92. The board stated that the respondent's (patentee's) restrictions to the claims removed objections already raised by the appellants. In such a situation the appellants could not have been taken by surprise, because they had to expect that the respondent would try to overcome all objections. The submission of auxiliary requests was clearly not a "fact" within the meaning of G 4/92 (see also T 771/92, in which the board held that the submission of restricted claims was neither a fact nor could it be evidence). In cases T 912/91, T 202/92, T 856/92, T 890/92, (see also T 673/06 and T 235/08), which were based on similar facts, the board also concluded that Art. 113(1) EPC 1973 had been satisfied.

In T 1448/09 refusal of the European patent application was based on the common general knowledge as illustrated by document D3. That stance was first taken in the oral proceedings before the examining division, which the appellant did not attend. According to G 4/92, arguments could be presented at any time, even during oral proceedings in the absence of a party, but the same did not apply to new facts forming the basis for a decision. A reference to the common general knowledge could be presented as an argument, but the existence of that knowledge was a matter of fact. If its alleged existence was disputed, the facts relevant in that regard had to be established. That meant that the party against which this knowledge was cited had to have the opportunity to dispute or accept it. In the case in hand, the appellant had neither been aware of the examining division's invocation of the common general knowledge nor of the existence of document D3 until the decision was announced. This violated the appellant's right to be heard on the relevance of document D3 and, by extension, on the existence of the invoked common general knowledge.

In T 1049/93 the board held that, where a duly summoned respondent (opponent) chooses not to attend oral proceedings, a board can still consider prior art which might be an obstacle to the maintenance of the patent in suit. The opportunity to be heard is offered by summoning the parties to a hearing before the board. If the respondent chooses not to avail himself of this opportunity, his right to be heard is exhausted to the extent that it

concerns facts and arguments in support of his position. **G 4/92** should not be construed as extending or prolonging the rights of a voluntarily absent party.

In case **T 414/94** the board stated that there was no general prohibition on amending requests during a party's absence from oral proceedings. An absent party (here, the opponent) must expect reactions of the opposing party (here, the patentee) within the legal and factual framework of the case established prior to oral proceedings, and the possibility of decisions taking account of, and being based on, such reactions.

In **T 501/92** (OJ 1996, 261) the board ruled that if a new ground for allowing the appeal based upon the file record (here, the patentee's failure to file a formal request to maintain the patent) was raised by the appellant (opponent) for the first time during oral proceedings from which the respondent (patentee) was voluntarily absent, it would be contrary to Art. 113(1) EPC 1973 and the principles underlying **G 4/92** to allow the appeal on the basis of this new ground without giving the respondent an opportunity to comment.

In **T 892/94** (OJ 2000, 1) the board held that the right to be heard of a party absent from oral proceedings as expounded in **G 4/92** could, in appropriate circumstances, be surrendered by a party. The respondents'/patentees' declaration, before the oral proceedings that they would take no further part in the proceedings could only be construed as an unequivocal decision to surrender, voluntarily, their rights according to Art. 113(1) EPC 1973 and to no longer to avail themselves of the opportunity to present their comments on any objections, facts, grounds or evidence which could be introduced into the proceedings by the appellants or the board and which could turn out to be decisive.

In **T 191/98** the board referred to **G 4/92** and considered that the respondent (patentee), when informing it of its non-appearance, should have expected that the board would decide in substance on the patent in its granted form, taking into account any piece of evidence filed by the appellant (opponent) and arguments based on that evidence, including a line of argument further developed during the oral proceedings.

2.7.3 Non-attendance at oral proceedings before the boards – Article 15(3) RPBA 2007

The introduction of Art. 11(3) RPBA 2003 (now Art. 15(3) RPBA 2007) superseded the findings of **G 4/92** for the non-attendance at the oral proceedings before the boards (**T 706/00**). For cases in which the applicant files amended claims in appeal proceedings after the oral proceedings have been arranged and then does not attend them, see chapter V.A.4.5.3. a) "Absence of applicant (patent proprietor) from oral proceedings". The appellant can reasonably expect that during the oral proceedings the board will consider the objections and issues raised in its communication. By not attending the oral proceedings, the appellant effectively chooses not to avail itself of the opportunity to present its observations and counter-arguments orally but instead to rely on its written case (Art. 15(3) RPBA 2007; see e.g. ex parte cases **J 15/10**, **T 1625/06**, **T 628/07**; see also **T 55/91**). As cited in **T 991/07**, the explanatory notes to then Art. 11(3) RPBA (CA 133/02, dated 12 November 2002) state that Art. 15(3) RPBA 2007 "does not contradict the principle of the right to be heard pursuant to Article 113(1) EPC since that Article only

affords the opportunity to be heard and, by absenting itself from the oral proceedings, a party gives up that opportunity."

a) Ex parte proceedings

In T 991/07 the board decided, with reference to Art. 15(3) and 12(2) RPBA 2007, that it could base its decision on objections which would be new to the appellant, but which could not be communicated to it due to the fact that the appellant was not present at the oral proceedings, without infringing the appellant's right to be heard (Art. 113(1) EPC). The board observed that in line with established case law (cf. e.g. decisions T 823/04 and T 1059/04; see also T 1704/06, T 532/09, T 1278/10 – all ex parte cases), the appellant who decided not to attend oral proceedings had nonetheless had the opportunity to do so and that the requirements of Art. 113 EPC were thus met. A further justification for such an approach was that a party who filed substantive amendments to its case and then deliberately absented itself from oral proceedings in order to avoid any adverse decision being reached would infringe the general principle that it is incumbent on both the EPO and users of the European patent system to act in good faith (G 2/97). This was especially true in situations where the appellant had initially requested that oral proceedings be held.

In T 578/14 the board took the view that, in the case in hand, the duly summoned appellant, who of her own volition did not attend the oral proceedings, could not be placed in a more advantageous position than she would have been if she had attended. The appellant's voluntary absence could not therefore be a reason for the board not to raise issues it would have raised if the appellant had been present.

In T 1367/09 the board did not raise Art. 84 EPC in its communication pursuant to Art. 15(1) RPBA 2007. When reconsidering the case in preparation for the oral proceedings, the board noted that Art. 84 EPC should also be addressed. The oral proceedings were held in the absence of the appellant. In its decision, the board stressed that a board's communication has a preliminary character and does not have to be exhaustive. In general, new grounds for refusal have to be discussed during the oral proceedings. However, if a duly summoned appellant does not attend the scheduled oral proceedings, it waives the opportunity to present its comments on new grounds which were not mentioned in the communication under Art. 15(1) RPBA 2007 but are decisive for the decision. In view of the principle of procedural economy, the board is not obliged to delay its decision. A board's decision dealing with new grounds, on which the appellant has not presented its comments, does not contravene the right to be heard (Art. 113(1) EPC) in such a case.

In T 1000/03 the board held that the appellant had been duly summoned, and at the oral proceedings could easily have corrected the minor deficiencies in the description. To delay the decision pending their correction was uncalled for (see Art. 11(3) RPBA 2003, Art. 15(3) RPBA 2007). Under Art. 113(2) EPC, the board had to keep to the text submitted by the appellant (applicant), who by not appearing at the oral proceedings had taken the risk of the application being refused even for easily remediable deficiencies (see also the ex parte case T 1903/06).

b) Inter partes proceedings

In T 986/00 (OJ 2003, 554) the board held, with reference to Art. 113(2) EPC and Art. 11(3) RPBA 2003 (Art. 15(3) RPBA 2007), that a patent proprietor who chooses not to be represented at oral proceedings should ensure that he has filed all the amendments he wishes to be considered. All the more when, as in the case at issue, the proprietor had been expressly warned about the possible necessity of amending the claims and the description.

In T 1010/13 oral proceedings took place in the presence of appellant I only. Although appellants II, III and IV did not attend the oral proceedings, the board held that the principle of the right to be heard pursuant to Art. 113(1) EPC was observed since that article affords only the opportunity to be heard, and by absenting itself from the oral proceedings a party gives up that opportunity (see the explanatory note to Art. 15(3) RPBA 2007 cited in T 1704/06, CA/133/02 dated 12 November 2002); see also chapter V.A.4.5.3 a) "Absence of applicant (patent proprietor) from oral proceedings".

2.8. Changes in the composition of the opposition division after oral proceedings

In T 960/94 the composition of the opposition division had changed between the decision announced orally and the written decision. The board decided that issuing the written decision on behalf of an opposition division whose first member was not present at the oral proceedings amounted to a substantial procedural violation of both Art. 113(1) and 116 EPC 1973, as it had been issued on behalf of a first member before whom the parties had been given no opportunity to present their comments at oral proceedings.

In T 862/98 the decision of the department of first instance was signed by an opposition division different from that before which the oral proceedings had taken place. Oral proceedings being a fundamental expression of the right to be heard (see e.g. T 209/88), any findings at oral proceedings relevant to the final decision should be made in the presence and with the involvement of those members giving the final decision. The board decided that changes in the composition of an opposition division after oral proceedings should generally be avoided, even if no final substantive decision had been given orally. Where changes were unavoidable, new oral proceedings must in general be offered to the parties (see the analogous rule in Art. 7(1) RPBA 2003 (Art. 8(1) RPBA 2007)). Such offers might be forgone in exceptional cases.

In T 837/01, the final decision of the opposition division had only been signed by three members of the division, whereas the copy sent to the parties bore the name of all four members, including the legally qualified examiner. Upon enquiry by the board, it turned out that the legally qualified member had not simply forgotten to sign the decision but had not been involved in taking the decision which constituted a substantial procedural violation (see also T 990/06).

For further cases, also with regard to changes in the opposition division's composition prior to the oral proceedings, see chapter III.K.1.3.2 "Change in composition of opposition division during opposition proceedings".

3. Text submitted or agreed by applicant (patent proprietor) – Article 113(2) EPC

3.1. General
